IT CAN HAPPEN HERE

Lest we forget—we who are of the vitamin D era—severe rickets is not yet eradicated, and moderate and mild rickets are still prevalent Here is a white child (see facing page), supposedly well fed if judged by weight alone, who developed severe rickets despite the fact that he was reared on a farm in a locality having an average amount of fall and winter sunshine equal to that in Texas, Louisiana, and a number of other southern states

How much more likely then that rickets will develop among city-bred children who live under a smokepall for a large part of each year True, vitamin D is more or less routinely prescribed nowadays for infants But is the anti-ricketic routinely administered in the home? Does the child refuse it? Is it given in some unstandardized form, purchased from a false sense of economy because the physician did not specify the kind?

A uniformly potent source of vitamin D such as Oleum Percomorphum, administered regularly in proper dosage, can do more than protect against the gross visible deformities of rickets It may prevent hidden but nonetheless serious malformations of the chest and the pelvis and will aid in promoting good dentition

MEAD JOHNSON & CO., Evansville, Ind., U. S A

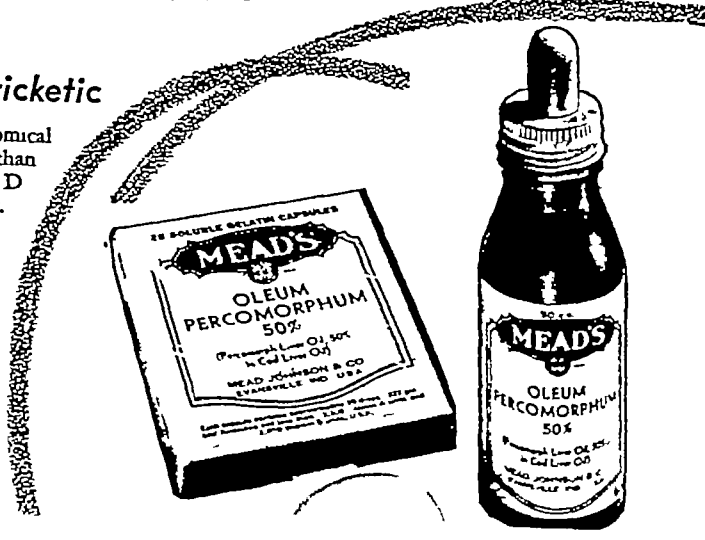
The state in which the boy pictured at right developed bow legs and other signs of severe rickets lies between latitudes 37° and 42° Most of this state has from 50 to 60% winter sunshine (regarded as a sunny climate) and a portion has from 40 to 50% winter sunshine As will be seen from the blue area in the U S Weather Bureau map at the left, the major portion of the United States lies in a similar belt Only a relatively small thinly populated section has a higher percentage of winter sunshine

Example of severe rickets in a sunny clime Courtesy of E H Christopherson, M D , San Diego, and of "California and Western Medicine

DESPITE the fact that this child was brought up on a farm and evidently lived out of doors a good deal, in a locality having a high altitude and a sunny climate, he developed all the stigmata of severe rickets—*genu varum*, quadratic head, flat feet To guard against such deformities, children in most sections of the United States need a regularly administered, dependable antiricketic such as Oleum Percomorphum

SEVERE RICKETS

. . . IN A *SUNNY CLIME*



Even a sunless climate need bring no threat of the gross or the invisible deformities of rickets when Oleum Percomorphum is administered as the prophylactic Because the dosage is measured in *drops,* Oleum Percomorphum is taken willingly and is well tolerated by infants and growing children Rigid bioassays assure a uniform potency—100 times the vitamins A and D content of U S P cod liver oil Oleum Percomorphum, moreover, is a natural product in which the vitamins are in the same ratio as in U S P cod liver oil

An Economical Effective Antiricketic

Important, too, Oleum Percomorphum is economical to the patient. Each gram offers not less than 60,000 vitamin A units and 8,500 vitamin D units (U.S.P) Supplied in 10 and 50 c.c. brown bottles, also in 10-drop soluble gelatin capsules in boxes of 25 and 100

Ethically Marketed

We purposefully selected for these products classic names which are unfamiliar to the laity or at least not easy to popularize No effort is made by us to "merchandise" them by means of public displays, or over the counter They are advertised only to the medical profession and are supplied without dosage directions on labels or package inserts. Samples are furnished only upon request

advanced INTESTINAL ANTISEPSIS

The use of drugs to inhibit the growth of putrefactive microorganisms in the intestines, has been generally abandoned Such intestinal antiseptics proved of little or no value in disinfecting the digestive tract Sterilization of food and use of cultures other than those of Acidophilus bacilli proved equally ineffective

Not until the development of B acidophilus milk by Cheplin and Rettger, were any inroads made in reducing putrefactive organisms in the intestines of man Today, B acidophilus therapy is definitely established, and B. acidophilus milk is successfully used for transforming the intestinal flora and relieving many symptoms associated with common intestinal disorders

Today, the only concern of physicians is to know that patients are getting a culture carefully controlled, and standardized as to purity, viability and intestinal adaptability of the polyvalent strains of B acidophilus by prescribing—

POYTHRESS

AND PROGRESS

THE GROWTH of the POYTHRESS' laboratories within a comparatively short span of life, may only be credited to the confidence and respect won throughout the medical profession

Steady increase in prescribing and using POYTHRESS' products has continually forced expansion and enlargement of facilities, memorializing a service to medicine

Nothing short of the most exacting quality in drugs and efficiency in compounding useful remedies could have gained such results, nor earned the patronage of an enlargening circle of practicing physicians

POYTHRESS and PROGRESS have become synonymous

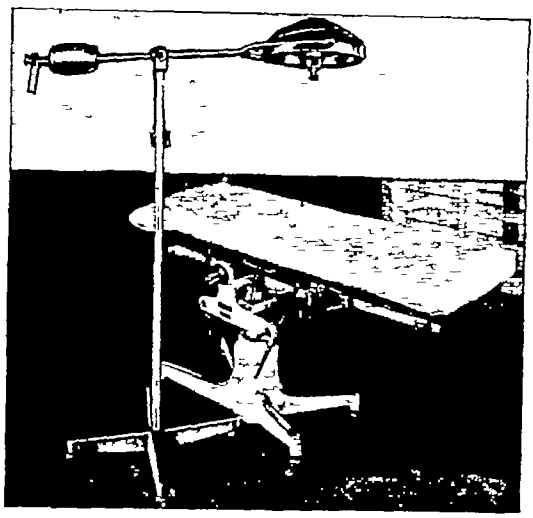
STillwell 4-7270

Pioneers Since 1908 in Medical and Surgical Equipment

BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)



Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy.

KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

KALAK WATER COMPANY OF NEW YORK, INC., 6 CHURCH STREET, NEW YORK CITY

improved mobile

SURGICAL ILLUMINATION

the

SCIALYTIC "T"

One of the finest surgical illuminators ever devised—projecting a beam of surgical light from any angle to any spot Light concentration ranges from 5 to 12 inches diameter, in varying intensities Output of 2700 ft candles at a distance of 39 inches Fixture completely counterbalanced — lamp raises from 4 to 8 feet and encompasses every requirement from vertical to horizontal with minimum effort Unequalled for difficult positional lighting—equipped with variable focus A fixture meeting most critical requirements — heat filtered, no glare, and shadow eliminating A practical adjunct to modern surgery, where too much light is never the case Aluminum head and new open dome construction makes for the lightest and coolest lamp on the market

Details of this and other revolutionary surgical illuminators yours for the asking

NATIONAL

SMALLPOX VACCINE

gives a high percentage of "takes" in primary vaccinations because:

1. An Active Seed Virus is used.
2. Calves producing vaccine are kept under sanitary conditions.
3. Careful technic in the vaccination of animals.
4. Vaccine is collected with aseptic care.
5. Necropsy reports must show animals were in perfect health.
6. Bacteriologic tests are conducted to insure a vaccine free from pathogenic organisms.
7. Potency and clinical tests are made on each lot of National Smallpox Vaccine insuring an active and satisfactory vaccine.

The potency of Smallpox Vaccine is higher and the danger of infection of the vaccination wound is minimized during the cold weather

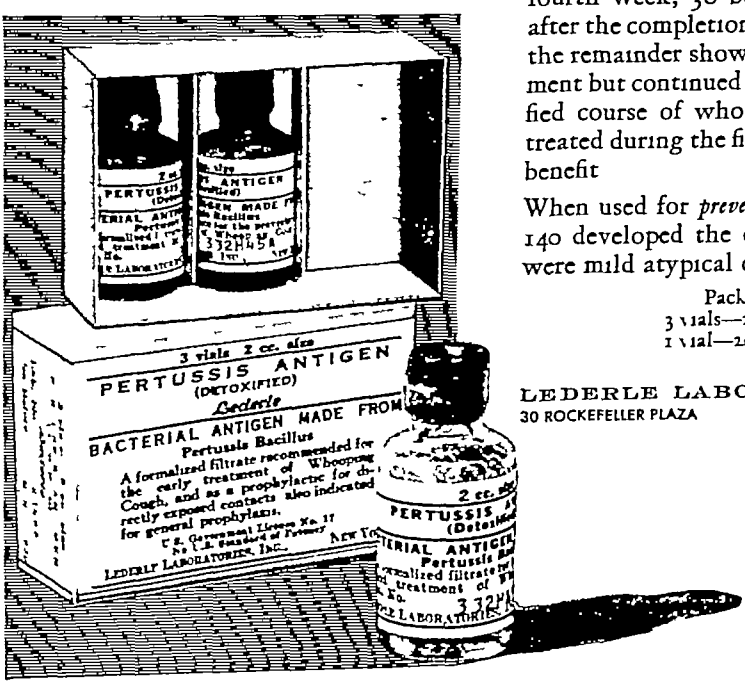
PERTUSSIS ANTIGEN

(Detoxified)

Lederle

THIS new form of therapy is recommended for the treatment of active cases of Whooping Cough as well as for general prophylaxis

Free from bacterial cells, Pertussis Antigen (Detoxified) *Lederle*" is a departure from the usual form of vaccine therapy Based upon a toxic principle derived from H pertussis, treatment with formalin converts the toxic factor into a non-toxic substance having antigenic properties



If used early in *treatment* or soon after exposure, the immunological response is sufficiently rapid to modify or prevent, respectively, the disease in the majority of cases, as evidenced by the following

49 of 53 cases treated during the first or second week did not develop whooping or vomiting

Of 70 cases treated during the third or fourth week, 30 became symptom-free after the completion of injections, while the remainder showed marked improvement but continued to run a mild, modified course of whooping cough Cases treated during the fifth week showed no benefit

When used for *prevention*, only 3 out of 140 developed the disease and those 3 were mild atypical cases

Packages
3 vials—2 cc each
1 vial—20 cc.

LEDERLE LABORATORIES, INC

Announcing

VI-DELTA EMULSION

Lederle

(VITAMINS A AND D)

ALTHOUGH IT IS more potent in Vitamins A and D than Cod Liver Oil, U S P XI, this new emulsion has

—no fish-oil taste
—no after-taste
—nor does it cause flatulence

On the contrary, it tastes like orange syrup and children lick the spoon and beg for more It can be flooded over ice cream to make an 'orange sundae and unsuspecting guests will pass their plates for second helps—it s been done!

The special feature is the new fish liver oil concentrate, derived from various fish (excluding cod) and balanced to a uniform high potency of Vitamins A and D Unlike cod liver oil, whose inherent rank taste bursts through all disguises, this concentrate is practically tasteless, the flavor of the emulsion is only that of the materials with which it is blended malt, sugar and natural orange juice

To conform with familiar dosage practice, Vi-Delta is so balanced that each teaspoonful (4 cc —5 2 gram) contains 3200 units U S P XI Vitamin A and 400 units U S P XI Vitamin D, same as "cod liver oil N N R " and exceeding "cod liver oil U S P. XI (which has 2180 A, 313 D)

Packages
8 oz. and 16 oz bottles

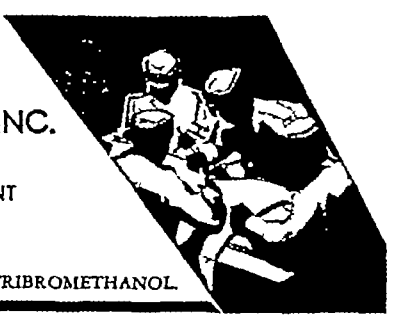
Almost a Decade of Steady Progress in Basal Anesthesia by the Rectal Method

AVERTIN

with

AMYLENE HYDRATE



SINCE the introduction of Avertin with Amylene Hydrate for basal anesthesia, approximately 400 reports on its use in general surgery, gynecology, obstetrics and other specialties have been published in North American journals In many of our largest hospitals this method of basal anesthesia is now employed daily

Avertin with Amylene Hydrate appeals so favorably to patients, anesthetists and surgeons because they appreciate that this method provides satisfactory basal anesthesia Write for booklet "Avertin with Amylene Hydrate" (recently revised), giving detailed information regarding dosage and manner of use, signs and symptoms of basal anesthesia and the postoperative stage, the use of supplemental anesthesia in reduced dosage, as well as indications and contraindications

Avertin with Amylene Hydrate is supplied in bottles of 25 cc. and 100 cc (each 1 cc. containing 1 Gm of Avertin).

The pamphlet on Avertin with Amylene Hydrate is sent free to physicians on request

CONTRAST MEDIA VARY IN EFFECTIVENESS AS STARS VARY IN BRILLIANCE

LIPIODOL (LAFAY)* FOR PRECISE SHARP RADIOGRAPHS

These, briefly, are the eight essential features of Lipiodol (Lafay):

1. The original French iodized oil
2. Not a chloro-iodized oil—contains no chlorine
3. Light amber color—helps detect deterioration
4. Bland and well tolerated even by delicate tissues
5. Relatively non-irritating and non-toxic
6. Precise, clear cut, sharply outlined radiographs
7. Facilitates diagnosis of many obscure conditions
8. Reveals pathologic conditions which ordinary radiographs cannot visualize.

*Iodized Poppy-Seed Oil 40%.

COUNCIL ACCEPTED

A New and Useful Inhalation Anesthetic

Vinethene will appeal to the general practitioner for use in procedures where a short period of anesthesia is desired, either in the home or hospital, such as

Reduction of fractures • *Manipulation of joints*
Dilatation and curettage • *Myringotomy*
Repair of perineal lacerations and other short obstetrical procedures • *Changing of painful dressings*

Induction and recovery are rapid, maintenance is smooth, postanesthetic nausea and vomiting are infrequent Post-operative complications are rare

SUPPLIED IN 25 cc and 50 cc. bottles, and in small containers convenient for the physician's bag—boxes of 3—10 cc. vials with a special dropping cap

LITERATURE ON REQUEST

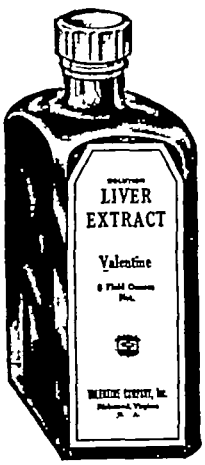
MERCK & CO Inc. *Manufacturing Chemists* RAHWAY, N J

ACCEPTABLE TO FASTIDIOUS PATIENTS

Neo-Silvol (Colloidal Silver Iodide Compound) is particularly suited for use in eye, ear, nose and throat. It is antiseptic in action and has the added advantages of being non-staining and non-irritating. Even in 25 to 50 per cent solution Neo-Silvol will not injure delicate mucous membranes.

Ten to twenty per cent solutions of Neo-Silvol are suitable for most eye infections, gonorrheal ophthalmia may call for stronger solutions—25 to 50 per cent. In inflammatory conditions of the nose, naso-pharynx, pharynx and tonsils Neo-Silvol (10 to 25 per cent strength) may be sprayed or swabbed on the involved areas three or four times daily. Neo-Silvol solutions are easily prepared by dissolving the glistening, cream colored granules in water.

•



Supplied in six-grain capsules, packages of 50 and 500, and in 1-ounce and 1/4-pound bottles.

PARKE, DAVIS & COMPANY, DETROIT • *The World's Largest Makers of Pharmaceutical and Biological Products*

An aqueous liver extract of proved potency and economy.

Effective in pernicious anemia, sprue and the anemia of pregnancy

DOCTORS SPECIFY VI-SYNERAL* (Funk-Dubin) —THE ORIGINAL VITAMIN-MINERAL CONCENTRATE—BECAUSE

1 It contains the essential vitamins and minerals, without which adequate nutrition is impossible

2 It helps build vitality and resistance to colds

3 It helps build strength in debilitating conditions

4 It is a necessary supplement to the average diet which rarely contains adequate amounts of vitamins and minerals

5 It is a necessary supplement to special and restricted diets which do not contain adequate amounts of vitamins and minerals

6 It is of value for older people who complain of a vague feeling of ill health and fatigue

7 It helps to build up the general nutritive picture so that there is better response to whatever specific medication the doctor may have prescribed.

8 It facilitates recuperation during the period of convalescence after illness or operation

9 It serves as a supplement to the diet of infants and children to help provide the necessary elements for proper growth

10 It offsets the demands for vitamins and minerals made on the body during the periods of pregnancy and lactation

NO need to remember which vitamins your patient should get Just specify "VI-SYNERAL"—containing vitamins A, B_1, B_2(G), C, D, E, fortified with eight essential minerals—calcium, phosphorus, iron, copper, iodine, manganese, magnesium and zinc—in ample amounts to provide "corrective diet insurance" Prepared under the direction of Dr Casimir Funk and Dr H E Dubin (pioneers in vitamin research and therapy) *Dosage* one vitamin and one mineral capsule daily, preferably before dinner

TWO IMPORTANT OTOLOGICAL DEVELOPMENTS *that you should know about*

Portable Aurogauge and Acoustiscope

● The recently perfected portable Aurogauge pictured above provides a ready means whereby many Acousticon combinations, each substantially different, may be conveniently tried by the patient in his own home or at one of our offices As in the fitting of eye glasses, the patient himself decides which combination brings him the best results

Also shown above is the Acoustiscope—it utilizes the cathode ray principle to help the deafened patient gauge the intensity of sound during the fitting A line of green light is steady when the room is silent—vibrates with increasing intensity as volume of sound increases Thus the patient actually sees what he should be hearing—can be sure the better hearing he experiences is due to the hearing aid he has chosen and not to intensified speech volume. The booklet "Royal Road to Joyous Hearing" in which both these devices are described will be sent on request

Arsenic

The peasants of Styria, a mountainous Austrian province, indulge in the strange practice of arsenic eating Styrian spring waters and the soil itself are purposely ingested in quantities which are said to contain as much as eight grains of the drug, and such doses are often taken several times each week One who is acquainted with the action of arsenic would expect severe poisoning to result, but on the contrary the arsenic eaters apparently derive a tonic effect. The physician who prescribes arsenic cannot be so oblivious to its toxicity, but fortunately the drug, in certain newer compounds, may be administered with little danger of intolerance. Carbarsone, Lilly, is such a preparation which during its broad acceptance as an amebicide has been unusually free of toxic properties —Adv

ONE ACCURATE PREDICTION CAN BE MADE

What of the year ahead? What is the shape of things to come? Of one thing, as a physician you can be sure, in 1938 as in all the years to come: when you write a prescription that is filled at a Liggett drug store you are assured of ingredients of the highest known standards of purity, chemicals and pharmaceuticals that are always fresh, full strength, and the protection of an inflexible Liggett code. "No Liggett employee shall in any way deviate from the physician's written instructions." For greatest accuracy, maximum effectiveness, and genuine economy, say to your patient. "Take this prescription to your nearest Liggett drug store to be filled."

Liggetts
THE REXALL DRUG STORES

For Children's Colds

In prescribing 'Benzedrine Inhaler' for children's head colds, you are providing a first aid remedy which may prove of constant service.

At the first sign of a cold the child is instructed to use the inhaler. Since benzyl methyl carbinamine is volatile, it penetrates to areas not readily accessible to liquid inhalants, and there is no oil to be aspirated and become a potential source of later trouble by accumulating in the lungs. (Graef—Am. J. of Path., Vol. xi No. 5, Sept 1935.)

For the adult members of the family, 'Benzedrine Inhaler' is equally useful.

Each tube is packed with benzyl methyl carbinamine, .325 gm oil of lavender 097 gm., menthol, 032 gm.

Benzedrine is the trade mark for S K F s nasal inhaler and for their brand of the substance whose descriptive name is benzyl methyl carbinamine

POLIOMYELITIS

The Present Status of our Knowledge

JOHN FITCH LANDON, M D, *New York City*

Despite the prodigious amount of intensive work expended by laboratory workers, epidemiologists, and clinicians in studying poliomyelitis during the past thirty years, much if not most of our knowledge of this disease still remains extremely hazy and speculative Many of the fundamental facts essential to our understanding of any communicable disease, such as etiology, incubation period, mode of transmission, method of entrance of the causative organism into the body, prevention, and specific treatment are either entirely unknown or only partially understood Compare, for instance, the extraordinarily complete knowledge in our possession concerning diphtheria with our woefully inadequate comprehension of the problem of poliomyelitis Much of the data in the latter disease is so conflicting as to leave one annoyed and dazed

It is perhaps trite to state that the more obscure our knowledge of any disease, the more fascinating it becomes and this probably accounts in large measure for the widespread interest in the problem of poliomyelitis

The purpose of this paper is to present a synopsis of the recent experimental and clinical studies and to summarize our present knowledge of the disease

Etiology

Although it has not yet been definitely proven, so far as the human subject is concerned, all of the experimental evidence has for many years pointed to a filterable virus as the causative agent of poliomyelitis, despite the fact that Rosenow[1] still insists that a pleomorphic streptococcus is responsible Tremendous advances in the study of viruses in general have been recently made Thus it has been possible, by the employment of collodion membranes of varying degrees of permeability,[2] to estimate the size of the various viruses, that of poliomyelitis being found to be extremely small, approximately 100th of a millimicron in diameter or 100th of the diameter of a staphylococcus or one millionth of its mass[3] Further, it has been demonstrated that once a virus has undergone union with its prey cell no amount of antiserum can attack it[4] This experimental evidence possibly explains the recently demonstrated apparent inefficacy of serum in the treatment of human cases, since once clinical manifestations of the disease have become apparent, it may be too late for any form of serum therapy This point will be discussed later

Mode of Invasion

The concept as to how the virus gains entrance into the body has been radically changed due to recent experimental work For many years it was believed that the disease was generalized and systemic, that the whole body shared more or less in the infection, the central nervous system being invaded by way of the meninges and the spinal fluid However, the work of Fairbrother and Hurst[5] and later Jungeblut and Spring[6] has of-

tirely possible that under certain conditions in the human being both the nasal and the gastrointestinal routes may play a part

Significance of Neutralizing Antibodies

Another interesting problem which has recently received intensive study is the significance of neutralizing antibodies in the blood of convalescents and so-called "normal" individuals For many years it has been known that in a large percentage of adults who give no history of the disease or known exposure to it, neutralizing substances may be found in the blood Since the proportion of immune sera increases with age it has been reasoned by analogy with diphtheria[14 15] that most individuals have been rendered immune from the disease by contact with a dose of the virus so small as to produce an unrecognized attack of the disease and yet sufficient to afford protection—the so-called theory of subclinical immunization This important immunological concept has been built up entirely on the assumption that the amount of neutralizing substance present in the blood can be accepted as an accurate indication of the resistance of the individual to the disease This postulate is now under severe fire Thus, it has been shown[16] in a fairly large series (183) of patients convalescent from the disease that nearly forty per cent showed no antibody in the blood Equally surprising is the suggestive evidence presented by Harmon and Harkins[16] that the disease may develop in the presence of neutralizing antibodies The significance of this work is apparent If the presence of neutralizing antibody in the blood cannot be accepted as proof of the individual's resistance to the disease then the long adhered to theory of immunization by subinfective doses of the virus must be seriously questioned In short, the presence of neutralizing antibodies in the blood may represent only humoral immunity and *not* tissue immunity and may therefore be unreliable as an index of active resistance on the part of the central nervous system to the disease The *specificity* of these antibodies has also been questioned, Jungeblut and others[17] having shown that various widely diverse substances such as diphtheritic and antistreptococcic antitoxins, antivenoms, human placentas, and even the sera from pregnant mares also contain specific virus-neutralizing antibodies

Students who reject the theory that contact with the virus alone is essential to antibody stimulation have advanced various suggestions to account for resistance such as constitutional factors, growth, the so-called maturation theory, endocrine influences, and blood grouping (Jungeblut and Smith[18] demonstrated that individuals with group B blood are found markedly resistant to poliomyelitis)

In short, our entire concept of the significance of the presence or absence of antibodies in the human blood may have to be revised, and, concomitantly perhaps, also, a revision of the previously accepted epidemiological theories

Turning to the practical aspects of the disease, let us first consider the newer explanation of the symptomatology based upon the previously reviewed theory of axonal transmission of the virus by the olfactory tract The earlier and now practically discarded systemic theory of the disease was postulated on the entrance of the virus into the blood by the lymph and thence into the central nervous system by penetration of the meningochoroid barrier, the earliest symptoms being usually referable either to the gastrointestinal tract (vomiting or diarrhea) the upper respiratory tract (coryza and bronchitis) or marked sweating, hyperesthesia, tremor, headache, drowsiness, tachycardia, apprehension, and fever According to the more recent neurological concept as proposed by Faber[19] and others these symptoms can all be explained on the basis of the invasion by the virus of the sensory and vegetative centers of the diencephalon, which it reaches via the olfactory tract With further progression of the virus to the posterior horn cells of the cord, there ensues the train of signs formerly attributed largely to meningeal irritation —stiff and painful neck and spine, exaggerated deep reflexes Kernig's sign, and local pain and tenderness of the muscles A few hours later with involvement of the anterior horn cells

fered almost conclusive proof that the virus is transmitted directly along the axones of the nerve cells and neither systemically or by way of the perineural lymphatics as previously suggested by Burrows[7] Virus injected into the cerebral cortex of rhesus monkeys has been traced to the thalamus, medulla, and cord by way of the nerve tracts In 1933 Faber and Gebhardt and coworkers[8,9] instilled virus into the nasal passages of monkeys and found that it reached the olfactory bulb on the fourth day, the hypothalamus on the fifth, thalamus and midbrain on the sixth, and the spinal cord presumably via the spinothalamic tract on the seventh day It was demonstrated that when the olfactory nerves were severed no monkey developed the disease after nasal instillation whereas all of the control animals were infected and succumbed Observers have repeatedly pointed out that the olfactory mucosa with its twenty-odd amyelinic nerve fibers passing up through the cribiform pate present an ideal field for attack by the virus It has been suggested that many individuals harbor the virus in their nasal passages without succumbing to the disease until trauma, such as tonsillectomy[10] or excessive muscular exertion lowers the resistance of the host sufficiently to allow penetration of the virus into the central nervous system The hitherto totally inexplicable occurrence of single cases in very isolated communities might be explained on the basis of such a theory

Although the experimental evidence for olfactory entrance of the virus appears overwhelming, it should not be overlooked that the evidence is still experimental and that what may hold true for monkeys does not necessarily apply to the human being This important lesson was learned from the employment of human convalescent serum which completely protects the animal in experiments with *in vivo* neutralization tests but is apparently of very slight, if any, benefit to man In this connection the work of Lawrence W Smith[11] of Willard Parker Hospital in 1931 should be mentioned He states

Examination of fifty-six olfactory bulbs microscopically has shown a surprisingly small amount of pathological change There has frequently been edema and congestion, harbingers of more extensive damage, but in less than a fourth of them, do the characteristic cellular infiltrative changes, as seen in the ganglia and nerve roots, appear Either any inflammatory reaction in these organs is extremely short-lived, unlike the lesions of poliomyelitis elsewhere in the central nervous system, or the virus passes along these structures without leaving its identifying signature The third possibility which strikes us as more logical, in view of the essential differences in the nature of the pathological lesions, is that the olfactory bulb in human beings is not necessarily as frequent a pathway for the virus as is commonly held, and the nerve roots elsewhere are equally important portals of entry, possibly indirectly by way of the blood stream to their ganglia This might help explain the relative infrequency of cerebral and cerebellar involvement. From our studies the pathways of distribution of the virus do not seem to be so simply explained in human cases as they do in experimental animal inoculation, and we are inclined to feel that not only direct extension by way of the nasopharynx and other nerve roots, but also the gastro-intestinal tract and blood stream must be considered as very significant factors

Very recently also investigators at the Rockefeller Institute[12] have added considerable experimental corroboration of these views

Furthermore, the general changes which occur throughout the body especially in the gastrointestinal tract and the generalized lymphatic hyperplasia must be explained by the advocates of the theory that poliomyelitis is a disease solely of the central nervous system The explanation advanced that the changes observed outside the nervous system are secondary and nonspecific and such as may occur in any febrile conditions, seems a bit weak

Again, virus has been recovered from the spleen by perfusion, the suggested explanation being that the virus "spills over" at the neural synapses, and gains entrance into extraneural system tissue

Thus while the case for olfactory transmission of the virus seems proven experimentally, there are still doubting Thomases such as Toomey[13] who, for the reasons previously cited, believe that the gastrointestinal tract is the portal of entry As a matter of fact, it seems en-

tirely possible that under certain conditions in the human being both the nasal and the gastrointestinal routes may play a part

Significance of Neutralizing Antibodies

Another interesting problem which has recently received intensive study is the significance of neutralizing antibodies in the blood of convalescents and so-called "normal' individuals For many years it has been known that in a large percentage of adults who give no history of the disease or known exposure to it, neutralizing substances may be found in the blood Since the proportion of immune sera increases with age it has been reasoned by analogy with diphtheria[14 15] that most individuals have been rendered immune from the disease by contact with a dose of the virus so small as to produce an unrecognized attack of the disease and yet sufficient to afford protection—the so-called theory of subclinical immunization This important immunological concept has been built up entirely on the assumption that the amount of neutralizing substance present in the blood can be accepted as an accurate indication of the resistance of the individual to the disease This postulate is now under severe fire Thus, it has been shown[16] in a fairly large series (183) of patients convalescent from the disease that nearly forty per cent showed no antibody in the blood Equally surprising is the suggestive evidence presented by Harmon and Harkins[16] that the disease may develop in the presence of neutralizing antibodies The significance of this work is apparent If the presence of neutralizing antibody in the blood cannot be accepted as proof of the individual's resistance to the disease then the long adhered to theory of immunization by subinfective doses of the virus must be seriously questioned In short, the presence of neutralizing antibodies in the blood may represent only humoral immunity and *not* tissue immunity and may therefore be unreliable as an index of active resistance on the part of the central nervous system to the disease The *specificity* of these antibodies has also been questioned, Jungeblut and others[17] having shown that various widely diverse substances such as diphtheritic and antistreptococcic antitoxins, antivenoms, human placentas, and even the sera from pregnant mares also contain specific virus-neutralizing antibodies

Students who reject the theory that contact with the virus alone is essential to antibody stimulation have advanced various suggestions to account for resistance such as constitutional factors, growth, the so-called maturation theory, endocrine influences, and blood grouping (Jungeblut and Smith[18] demonstrated that individuals with group B blood are found markedly resistant to poliomyelitis)

In short, our entire concept of the significance of the presence or absence of antibodies in the human blood may have to be revised, and, concomitantly perhaps, also, a revision of the previously accepted epidemiological theories

Turning to the practical aspects of the disease, let us first consider the newer explanation of the symptomatology based upon the previously reviewed theory of axonal transmission of the virus by the olfactory tract. The earlier and now practically discarded systemic theory of the disease was postulated on the entrance of the virus into the blood by the lymph and thence into the central nervous system by penetration of the meningochoroid barrier, the earliest symptoms being usually referable either to the gastrointestinal tract (vomiting or diarrhea), the upper respiratory tract (coryza and bronchitis) or marked sweating, hyperesthesia, tremor headache, drowsiness tachycardia apprehension and fever According to the more recent neurological concept as proposed by Faber[19] and others these symptoms can all be explained on the basis of the invasion by the virus of the sensory and vegetative centers of the diencephalon, which it reaches via the olfactory tract With further progression of the virus to the posterior horn cells of the cord, there ensues the train of signs formerly attributed largely to meningeal irritation —stiff and painful neck and spine, exaggerated deep reflexes, Kernig's sign, and local pain and tenderness of the muscles A few hours later with involvement of the anterior horn cells

there may appear the first evidence of weakness of the muscles, followed by the loss of tendon reflexes and flaccid paralysis The virus may die out at any point along the course producing either so-called abortive or nonparalytic (preparalytic) poliomyelitis In my opinion—perhaps because the mind is slow to abolish a long-accepted concept—this newer explanation does not as satisfactorily explain the progression of symptoms as that based on the older systemic theory, but, if axonal transmission via the olfactory nerves is accepted, then it is necessary to admit the probability of the newer theory being correct

It might be well to mention here that although a moderate increase in the cells of the spinal fluid is an almost constant finding in the acute stage of the disease, yet authentic cases may occur with a very slight increase and indeed, with no pleocytosis The converse is also true that a number of other conditions outside of the central nervous system—e g , enterocolitis, pharyngitis, tonsillitis, pneumonia, etc which may present for a time a clinical picture suggestive of poliomyelitis—may show a considerable increase in the spinal fluid cell count [20 21]

Prophylaxis

From the point of view of the practicing physician and the laity, the problem of prophylaxis and treatment has been of paramount importance for many years In 1916, during the New York City epidemic, the local Board of Health[22] received all manner of suggestions as to prophylaxis and treatment ranging from bags containing camphor to be hung around the neck to a serum made from the blood of frogs and intraspinal injections of fresh human saliva Today our attempts to discover specific prophylactic and therapeutic aids are fortunately on a more rational basis, but from a practical point of view, it must be admitted that the goal seems nearly as distant as it did twenty years ago

As for specific prophylaxis three methods have been recently advocated, the employment of immune blood, or of vaccines, and the intranasal instillation of viricidal substances

The intramuscular injection of whole blood was rather intensively practiced following the New York City epidemic of 1931 Stokes and his associates[23] in Philadelphia injected a fairly large group of children and concluded that their results justified further trial However, no definite proof of its efficacy has been advanced and for the simple reason that, due to the extremely low incidence of the disease—not more than one in 500 to 1,000 even in the worst epidemics—a prodigious number of individuals would have to be injected before anything like an adequate demonstration of its worth could be made

The argument advanced above may be employed in attempting to prove the clinical efficacy of vaccines However, the important question concerns not only the value of the agent but its safety Brodie and Park[24] developed a vaccine by injecting monkeys with poliomyelitis virus, emulsifying the cords, and inactivating the virus with formaldehyde Over nine thousand children have received this vaccine and it is claimed that after two doses six out of seven developed antibodies which persisted for eight months In view of the recent work questioning the infallability of the presence of humoral antibodies as an index of protection, the efficacy of this vaccine must remain *sub judice,* especially since a number of cases so treated have subsequently developed the disease even though at too great a length of time after inoculation to implicate the vaccine The present consensus of opinion is that, while the vaccine is safe, much more clinical data must be assembled before any definite statement as to its worth can be made It should be stated here, however, that there is a fairly general agreement that a completely inactivated virus fails to produce sufficient antigenic response to make it a potent immunizing agent

For this reason Kolmer[25] prepared a vaccine of infected emulsified cord in which the virus is devitalized but not completely killed by the use of sodium rincineolate Over 10,000 children throughout the country have received this vaccine Kolmer himself reports ten cases developing the disease several days after receiving two doses but none after receiving the third dose It is in-

teresting that paralysis developed in each instance in the limb where the vaccine was introduced, suggesting the possibility that the insufficiently inactivated virus gained entrance to the nervous system directly along the nerve of the injected part. However, the fact that paralysis did develop so soon after the injection of the vaccine would appear to be sufficient proof that this method is unsafe and adequate reason for its discontinuance.

The demonstration that certain chemicals, notably those of alum and picric acid and zinc sulfate, instilled intranasally in monkeys block the passage of virus so introduced has suggested its possible clinical application to human beings exposed to the disease Of course this work is postulated on the assumption that the olfactory route is the main if not the sole way by which the virus gains entrance into the body Not sufficient data has accumulated to warrant any definite statement concerning its efficacy, but of all the suggested methods of prophylaxis this would seem to hold out the highest hope

The enthusiastic claims for human convalescent serum in the treatment of poliomyelitis were undoubtedly based on the rather remarkable demonstrations of its ability to protect monkeys against the experimental disease when injected intracerebrally Within the last five or six years, however, painstaking statistical analyses of several fairly large series of cases with controls have failed to make out a case for the serum A number of able clinicians, especially in the West, are nevertheless convinced that its employment is of distinct benefit and suggest that the failure to achieve more dramatic results may be due to a number of factors, such as insufficient dosage, too low a content of antibodies, administration too late in the disease, etc. Nearly all students are in agreement on two points, first that the serum is worthless after paralysis has set in and secondly, that it should not be administered intraspinally because of the tendency to aggravate the already existing signs and symptoms of meningeal irritation The possibility that its administration by the intravenous route may do harm should receive consideration The intravenous employment of *any* substance is attended with some danger, however slight In the 1931 New York City[29] epidemic, general reactions were observed in over eighteen per cent of the cases to whom serum was administered by that route

Summing up the case for convalescent serum therapy therefore, the most that can be said for it is that some observers still believe that it remains the most logical means of "specific" therapy which we possess and that in their opinion further trial employing larger dosage seems justified However it should be borne in mind that the present consensus of opinion appears to be definitely unfavorable and the burden of proof of its value now rests on the shoulders of its advocates

Immune sera prepared from inoculating animals, especially horses, were employed in the 1931 New York epidemic[29] Death followed intraspinal injections in a number of cases and many severe reactions resulted from its administration intravenously so that its use has been discontinued

General Management

The general management of the ordinary "spinal" type of cases remains essentially what it was twenty years ago Rest which includes relief of pain, early immobilization of the paralyzed part (or parts) and, above all, encouragement, remain the fundamentals of therapy

So far as the more unusual types of the disease are concerned, namely, the "bulbar" and intercostal or diaphragmatic paralysis, not inconsiderable advances in our knowledge of how to handle them have been made in the past few years In the bulbar cases with involvement of the ninth and tenth cranial nerves where there is difficulty in swallowing with large amounts of mucoid material accumulating in the back of the throat, the essentials of treatment are (1) postural drainage—lowering the head of the bed to allow the secretions to flow out—(2) avoidance of all food or fluid by mouth during the first forty-eight hours, the patient's nutrition being maintained either by rectal feedings or intravenous infusions, and (3) almost constant aspiration of the accumulated secretions

of the throat by means of the Sorensen pump Use of the respirator is absolutely contraindicated in the bulbar type since it is practically impossible for the patient to synchronize his breathing with that of the machine and there is constant danger that the material will be drawn into the lung from the throat

The respirator should be reserved for cases having respiratory paralysis from either diaphragmatic or intercostal involvement or both There is apparently a widespread belief that this apparatus is uniformly lifesaving Analysis of the results of cases so treated,[30] however, do not bear out this impression For example, in the 1931 New York City epidemic, the mortality in a group of eighty-eight respirator-treated cases was 60 2 per cent but even more significant was the finding that, at the end of eighteen months, of the patients discharged from the hospital able to breathe spontaneously and apparently cured, 45 7 per cent had died from respiratory infections, chiefly pneumonia Extremely suggestive also of possible damage to the pulmonary structures is the marked alveolar emphysema and atelectasis found at postmortem The combined clinical and pathological findings thus suggest that the respirator may predispose the pulmonary apparatus to subsequent infection or collapse Its use is limited to a small group of cases where in some instances, it may be a life prolonging if not a life preserving measure

Conclusion

It is evident that much of the recent work on poliomyelitis has been destructive rather than constructive in nature—perhaps a healthy sign At any rate at the present time, we must face the fact that the prospects of solution of the many puzzling problems of this mysterious disease in the immediate future are not bright Until such a time as the epidemiology is thoroughly understood and until a simple method of determining the susceptibility to the disease has been found and definite specific prophylactic and therapeutic means for combating the disease have been discovered, it would seem that the lay public is entitled to share with us the realization of our profound ignorance of most of the essential facts of the disease The premature publication of half truths has for years kept the public in a state bordering on hysteria and has thrown a tremendous and increasing onus on the practicing physician

NEGLECTED HEALTH FACTORS IN PUBLIC SCHOOLS

WILLIAM ROSENSON, M D, *New York City*
Medical Adviser, Health Committee, United Parents Association, New York City Formerly Special Committee Health of School Children, New York County Medical Society

The past few years have witnessed an accelerating interest in preventive medicine Progress in this field has been stimulated by organized medicine as well as by a number of lay groups However, our accumulated knowledge of preventive health principles and procedures is still far in advance of our actual practice of them

The most fertile and promising field for further progress in this direction undoubtedly lies in more intensive work with children If we could but mobilize all our preventive health forces for the development of a robust, sound child population, fortified with wholesome physical habits and mental attitudes, the future would find many of our present day distressing problems in large measure or wholly solved Certainly this would apply to such pressing subjects as juvenile delinquency and crime, maladjustments, many psychoses as well as preventable acute and numerous chronic physical disabilities

The public school system with its millions of pupils under intelligent supervision during the large part of each day offers an unusual opportunity to put into practice on a large scale the principles and methods of preventive medicine Already considerable has been accomplished Pre-school vaccination against small-pox, immunization against diphtheria, control of the reportable, communicable diseases have become an integral part of the school regime

In recent years serious endeavors have been made to improve the periodic physical examination for the detection and correction of remedial defects The formation and extension of special classes for handicapped children, the cardiacs, the undernourished, mentally retarded, the physically crippled have helped to alleviate the afflictions of many children and in some instances to prevent further deterioration Complete restoration of health is sometimes attained

In New York City the Child Guidance Bureau has recently been established for the study and treatment of the child who is maladjusted, whether it be emotionally, socially or intellectually This marks a very important advance in the long-neglected field of preventive mental health There, also, the introduction of the activity program, a stimulating and most wholesome method of progressive education, will undoubtedly prove helpful

There are, however, in the public schools of New York City with which this study is for the most part concerned, a number of conditions, methods, and customs which are definitely harmful to the child's health and which require complete revision The effects of these conditions upon the child's health are seldom seen by the public health worker or the educator to whom are entrusted the direction of the school health program They are seen very frequently by the pediatrist in his daily work and contacts with children and parents I shall introduce the discussion of these neglected health factors by citing a few cases

A boy of ten was brought to me because of abdominal pain and vomiting These symptoms came on after lunch and on his way back to school for the afternoon session The child lived eight blocks from school The short lunch period, fifty minutes, allowed him no time to eat an adequate meal He rushed home, gulped his food, and raced back to beat the lateness gong On the way he would often vomit the half-chewed food The symptoms did not occur on school holidays Physical examination was negative

Within the past month, I saw a girl

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

of twelve years, twenty pounds underweight When I inquired about her feeding schedule, her mother assured me that it was impossible for the child to snatch more than a "bite" at noon as the school lunch period was entirely too short

The following case illustrates how an outworn, unwholesome attitude toward the school attendance records often proves seriously harmful to the child's health A girl of eleven was seen at home with all the classical symptoms and signs of a lobar pneumonia A week previously the child had had a severe "cold" but had insisted on attending school even in inclement weather in order that her class should maintain its much coveted 100% attendance record The teacher had so overstressed the importance of this that the child could not be persuaded by her parents to remain at home She attended school to uphold the class honor until a severe chill proclaimed the onset of a disease which kept her home for six weeks

In another case frequent gastrointestinal disturbances occurred because of the filthy, unsanitary conditions of the school lavatory A girl of thirteen from a household of decent standards, refused to attend to her natural needs for bowel evacuation This produced attacks of severe abdominal discomfort and constipation

An adolescent girl of fourteen attending high school was brought to me because of persistent tired feeling and loss of appetite On taking a school history I learned that she seldom had any time for outdoor fresh air and exercise because of the tremendous amount of homework. Each one of her five departmental teachers assigned an hour or two of work almost every day The child rarely got to bed at night before 11 o'clock I weighed her pack of books which she carried to and from school and found they weighed fourteen pounds

Lack of cooperation on the part of some school supervisors and their lack of insight in mental hygiene problems are illustrated by the following case During the early part of last year I was very frequently summoned by an overanxious mother to see her son of eleven The usual complaints were indefinite pains in the throat and head At no time was there any elevation of temperature. At each visit physical examination was entirely negative I suspected that the boy was feigning illness in order to remain away from school He eventually admitted this At school, however, he always attained the highest marks His I Q test was 150 The obvious deduction was that the work in the classroom was too simple for him, that he was bored and that he should be placed in a higher grade I explained this to the mother and we took the matter up with the principal of the school The latter disagreed with the findings and recommendation, was very resentful of any suggestion from the pediatrist, and the boy continued to have his symptoms. This year, however, there was a reorganization of classes in that school and it was found convenient to have my patient skip a class to one which has proven to be far more stimulating I am now rarely summoned to the home and when on occasion the boy is really sick, we can hardly keep him away from school

These cases are typical of many that I have observed in the private practice of pediatrics and during the course of institutional work with children Some of the important factors responsible for these unhealthy conditions in the New York City Public School system are the short lunch period, the overemphasis on attendance records, the unsanitary conditions, excessive homework, overcrowded classes, and the insufficient knowledge and practice of the mental hygiene approach to children's problems on the part of many teachers and supervisors In addition to the case histories of school children, the facts to be presented here regarding these subjects have been obtained from personal visits to a number of schools, from talks with parents and teachers, and as a member of several school health committees.

The Lunch Period

The recess allotted for lunch in the elementary school is fifty minutes The child is usually dismissed at 12M and is marked late if he returns to the class room after ten minutes to one He is expected to be on time in the yard not

later than a quarter to one This leaves at most forty-five minutes to leave the school building, to travel home and back to school, to eat lunch, to wash up and attend to necessary wants, and in walking to guard against street accidents by watching the traffic carefully and the traffic signals The schools are situated from one to eight blocks from the homes

In many instances the task is an impossible one There is no time for an adequate lunch. Much of the food is omitted or gulped The nervous strain attending this hurry frequently causes a lack of appetite and fatigue

The short lunch period allows no time for relaxation after the meal, so essential after the morning's work Seham, whose work on fatigue in the child is well-known, says of the luncheon period "Every child should be required to remain at the table for thirty minutes Before returning to school he should spend fifteen minutes in complete relaxation The rest, coupled with the walk home from school, will help to neutralize the morning's fatigue"

In 1925, when I first became interested in this subject, I sent a questionnaire to the Boards of Education of the ten largest cities in the United States ranking next in population to New York and obtained the following data regarding the lunch period

Chicago	1 to 1¼ hours
Boston	1¼ hours
Philadelphia	1¼ hours
Pittsburgh	1 to 1¼ hours
St. Louis	1 hour 10 mins
Baltimore	1¼ hours
San Francisco	1 hour
Detroit	1¼ to 1½ hours
Cleveland	1½ hours
Los Angeles	1 hour

New York has the shortest lunch period of any large city

In 1930 the New York County Medical Society through a subcommittee on the Length of School Lunches of the Committee on the Health of School Children made a survey of this subject Ninety questionnaires were sent to representative child welfare organizations, individual leaders in various universities interested in child hygiene, and pediatrists familiar with school health conditions in New York City

Fifty-three replies were received Only two favored the present schedule, fourteen favored one hour, nineteen favored 1¼ hours, and eighteen favored 1½ hours In its report published in 1931, the committee suggested that the fifty minute luncheon period should be changed to 1¼ hours

The Attendance Problem

Regular attendance at school should be encouraged but when this is overstressed, often becomes subversive to good health In some schools the attendance is made the subject of keen competition between the classes and a large placard marked "100%" is displayed on the door of the classroom that has no child absent during the designated period Prizes and banners are awarded for the best attendance record

If a pupil becomes ill and remains at home, his particular class may lose its pre-eminence The child with a keen sense of loyalty or perhaps of fear is apt to disregard or conceal early symptoms which may later prove to be serious He comes to school to uphold the class record only to intensify his own symptoms and to spread the infection among his classmates

It has long been the practice to send a monthly report to each school giving a comparative rating on the basis of attendance Some principals finding their school low in the list and desirous of making a good record are apt to put pressure upon the children directly or through the classroom teacher This sometimes leads to punishment for absences even in the case of illness

In 1935 a survey of the Committee on Child Health and School Attendance of the United Parents Association found that "in some schools all absences were punishable alike whether due to illness, truancy or other causes Punishments of children who had been absent because of illness included the withholding of the commendation card even in the case of the child of high academic achievement, marking the child zero for those classes from which he had been absent for a given day, in crowded classrooms sending the child who had been absent to the back of the room to share a seat rather than permitting him to return to the in-

dividual seat to which he had previously been assigned, or threatening the child with various dire penalties if he should fail to attend school regularly"

I am fully aware that neither the Board of Education nor the Superintendent of Schools in New York City wants sick children in the classroom nor do they want punishments meted out for legitimate absences But as long as keen competition for attendance records between pupils, between classes and between schools is fostered by the school authorities, it is difficult to eliminate the undue pressure upon the child

The attendance record can be kept up best by making the school work attractive and stimulating to the child Where this is done, as it is in some classrooms, there is no attendance problem

An underlying contributory factor in stimulating the drive for the high attendance record has probably been our system of state financial aid Under this plan the amount of money granted by the State of New York to its various cities for educational purposes depends upon the number of children in actual attendance A deduction is made for every day that a child is absent In New York such deductions for absences have cost the city as much as $270,000 in one winter month The actual expenditure for operating the schools remains the same whether children are absent or not It would seem more reasonable that state aid should be granted on the basis of the number of teachers and supervisory staff employed in the educational system Such a plan has been employed in Philadelphia and Pittsburgh

Sanitary Conditions

Sanitary conditions in many of the schools are a distinct menace to the child's health I have known a large number of children who find it impossible, because of the filth and stench to use the lavatories and frequently suffer unnecessary discomfort and pains I have visited a number of such school lavatories and found them entirely unfit for use—dirty, inadequately flushed, surcharged with an ammoniacal odor and without toilet tissue According to a recent survey by the Health Committee of the United Parents Association in only fourteen schools of fifty-one visited did the lavatories conform to modern standards Nineteen still had the old-fashioned outside toilets, some without even a connecting shed to the main part of the building Seats are of the "old square wooden type painted a dingy gray"

There is no adequate equipment for washing the hands No soap or towels are provided Some schools have no wash basins It seems incredible that such an elemental principle of health and decency as washing the hands should be entirely neglected in the largest educational system in the country While children are taught the importance of cleanliness and personal hygiene in the classroom, no efforts have been made to provide them with the first essentials to carry out these teachings

The school lavatories are frequently without supervision and unprotected from intruders No matrons or attendants are assigned to these important posts The entire set-up has a most unsavory, unhygienic atmosphere

In some instances the condition of the lavatories is undoubtedly due to the "contract system" of custodial service under which the custodian receives a lump sum to keep the school in order The fewer assistants he employs for this purpose the larger his personal income Although theoretically the custodian is responsible to the principal, it is amazing to learn what little influence the principal really has From my conversations with a number of principals, I am forced to the conclusion that the principals are more afraid of the custodians than the custodians are of them For the protection of the school child's health the contract system should be abolished

Excessive Homework

While efforts have been made in recent years to reduce the amount of homework in the lower grades of the elementary schools, nothing has been done about this matter in the upper grades and in the high schools

Four and five hours of work after a full day at school is undermining the health of thousands of our adolescent children At this period especially they

require relaxation, fresh air, and healthful outdoor exercise Instead we find children already tired from their school work embarking on another long period of mental exertion at home, often in crowded quarters under artificial light and retiring at 11 or 12 P M A great many suffer from chronic fatigue, anemia, loss of appetite, scoliosis, and eye strain

On the whole, the job of the school child in the upper grades and high school is one that no adult would tolerate It is about time we drew up a bill of rights for the school child How about a maximum hour law?

Mental Hygiene and the Overcrowded Classroom

For the prevention of mental disorders and juvenile delinquency there is no more important subject today than that of mental hygiene The school child, in the classroom one-third of his waking hours is tremendously influenced by the teacher in his mental and emotional reactions I have observed the metamorphosis of the nervous, irritable, unhappy child into a normal joyous personality by the change of a teacher I have seen tics and enuresis disappear in a like manner

Many teachers untrained in aspects of mental hygiene do not realize to what extent their actions and words affect the personality of the child One descriptive epithet, unwittingly uttered, often stirs up feelings of inferiority in the child which may have a lasting effect on his future behavior

All too often the teacher untrained in mental hygiene fails to recognize in the shy "goody-goody" of the class the asocial child who, withdrawing into a world of his own may be an incipient dementia precox She may not realize that the obviously "troublesome" child to whom she is giving all of her attention may be much the healthier of the two

Teachers must be trained to consider the health of the school child not only from the physical but the mental hygiene angle Mental hygiene courses for every teacher should be made compulsory

The overcrowded classroom makes it difficult for even the trained teacher to create and maintain a wholesome and healthful atmosphere in the classroom It is impossible to expect one teacher to give intelligent instruction and guidance to forty to fifty (at times even more) children There is no time for any individual attention There are in New York City at the present time almost six thousand classes with registers between forty and fifty-five children No class should have more than thirty-five children

Conclusions

The program outlined here for the protection of the school child's health in New York City is not a utopian one It is based on health principles which are elemental, so obvious as to be axiomatic It includes the following recommendations

1 Increase of the school lunch period from the present fifty minutes to 1¼ hours

2 Competition for one hundred per cent attendance records to be abolished

3 Revision of the State aid law so that funds be granted on the basis of the number of teachers and supervisory staff employed instead of attendance

4 Modern clean toilets under proper supervision by attendant and matron

5 Soap, towels, and wash basins

6 Abolition of the "contract system" of custodial service Sufficient help to insure cleanliness of the entire school building

7 Excessive homework for all classes in elementary schools and high schools to be curtailed

8 Thorough mental hygiene courses for all teachers to be made compulsory

9 Development of the mental hygiene approach

10 Maximum number of pupils in any class to be thirty-five

The practical application of these suggestions would entail the expenditure of considerable effort and additional funds It is essential however, that they be carried out The returns in healthier and happier children will undoubtedly justify our endeavors

SURGICAL TREATMENT OF STRABISMUS

JOHN HUGHES DUNNINGTON, M D, *New York City*
From the Institute of Ophthalmology, Presbyterian Hospital

Almost a century has passed since Dieffenbach, in 1839, performed the first tenotomy for strabismus, and in this interval numerous volumes have appeared covering all phases of the subject While it is true that much has been learned from these contributions, uncertainty still dwells in the minds of many on the surgical treatment of squint In this discussion an effort will be made to point out some of the reasons for this uncertainty and to direct your attention to some established facts, with the hope that this may prove helpful in handling these cases

Before proceeding with the actual operative treatment of squint it is appropriate to review the preoperative requirements No case should be considered from a surgical point of view until a certain minimum of information is at hand, and such a work-up should include the follow ng

1 Refraction under complete cycloplegia
2 Visual acuity, presence or absence of fusion and of diplopia
3 Measurement of the amount of deviation
   (a) With and without correction of refractive error
   (b) With and without cycloplegia
   (c) For distance and for near
   (d) In the six cardinal directions of gaze
4 A study of the movements of the eyes by the comitance test
5 A study of the near point of convergence

Since the *selection of the proper type of operative procedure* is the most important step in the surgical treatment of strabismus, we must use every available means to safeguard against an improper choice Our greatest aid in reaching a proper decision consists in an intelligent analysis of the preoperative findings Let us now consider some of the practical points to be gleaned from such a study

Error of refraction The accommodative origin of many squints is so thoroughly understood that little need be said about the importance of knowing what effect the use of lenses has upon the deviation I do not consider a deviation that is removable by lenses a surgical problem Occasionally one may encounter circumstances sufficiently extenuating to justify operation, but let us not be misguided by every patient's desire to have straight eyes without glasses. Cases of convergent strabismus with high hyperopia should be treated most conservatively In many such cases the correction of the refractive error diminishes but does not completely abolish the deviation The persistence in the use of the full correction over a period of years will often have a surprising effect upon this type of squint If one is forced to operate, special care should be exercised to avoid too great a weakening of the power of convergence, otherwise, in a very short period, a disfiguring exotropia results In these cases it is my aim to slightly undercorrect the residual squint and to accomplish this largely by a strengthening operation supplemented, if necessary, by a minimal (two mm) recession

Visual acuity, Fusion, and Diplopia Information on the *visual acuity* is important because any amblyopia ex anopsia should be corrected, if possible, by occlusion prior to operation In a convergent strabismus the presence of a high degree of amblyopia with eccentric fixation is a contraindication to a generous recession It is well-known that an eye devoid of the power of central fixation has a much greater tendency to diverge subsequently This natural tendency is greatly enhanced if the converging power is destroyed by too liberal a recession Conversely, when dealing with an amblyopic diverging eye, every attempt should be made to increase the ability to converge by a generous shortening of the internal rectus supplemented, if need be, by a recession of the external rectus The *presence or absence of fusion* does not influence the selection of the type of operation but gives us valuable information on the result we

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

have reason to expect It is always desirable to know preoperatively whether or not there is a diplopia, for if one is forced to operate in the presence of a double vision every effort must be made to increase the field of binocular single vision No general rules can be laid down in this condition but it is well to remember that a slight diplopia in the lower fields is often more annoying than a larger one confined to upward gaze Postoperative diplopia, the bête noir of ocular muscle surgeons, usually follows an overcorrection produced by a crippling recession or a complete tenotomy

Measurement of the amount of deviation Many methods are in use to determine the degree of squint, some of which are crude and inaccurate and should be used only when the more refined tests cannot be employed In my opinion, the screen test, as advocated by Duane, and seconded by White, is the method of choice White has recently brought forward the advantages of this test and has so clearly shown the reasons for its preference that it is sufficient for me to say that I am in complete accord with his views and urge its adoption Many objections have been raised to this test but, I believe, with a little patience and a moderate amount of experience, any one can become adept at measuring deviations by this method Complete information on the amount of deviation present under varying conditions is essential I know of no other way of accurately acquiring this information than by the use of the screen test

A deviation that is materially lessened by the correction of the refractive error, or by the use of complete cycloplegia, is largely accommodative in origin Any operative choice should bear this in mind and aim only at removing the nonaccommodative element For example, if in an esotropia, such a residual squint is more pronounced at the far range one would naturally incline towards a shortening of the external rectus, while if the residual deviation is present only at close range a recession of the internal rectus would be indicated Most ophthalmic surgeons agree in the rationale of such an operative selection yet comparatively few avail themselves of the opportunity of accurately acquiring this information preoperatively, by the use of the screen test It is generally recognized that a deviation most pronounced on distant fixation denotes an anomaly of divergence while one that is greatest at near range is primarily the result of a convergence anomaly, however very few surgeons make use of this knowledge in selecting their operative procedures Estimation of the amount of the deviation in the six cardinal directions of gaze gives us information on the concomitancy of the squint Many so-called concomitant deviations are of paralytic nature and only by measuring them in the different directions of gaze can this fact be brought out Duane, White, and others have stressed the importance of eliminating a vertical deviation, if a permanent correction of the lateral imbalance is to be obtained The coexistence of such a vertical deviation can best be brought out by measuring the amount of deviation present in the six cardinal directions of gaze It is not sufficient simply to note the presence of a small amount of vertical deviation but its causative factor must be determined by its behavior in the different directions of gaze In most cases of combined vertical and lateral squint both components have to be removed, yet there are a few in which a small vertical deviation can be ignored, if the operation is purely cosmetic Before operating upon a vertical deviation one must be positive which muscle is affected and should bear in mind that a double hypertropia is not an uncommon finding It is of the utmost importance to remember that the surgical handling of any vertical imbalance must be individual, however, the following general rules are helpful

1 Paresis of the superior Rectus with fixation by the paretic eye usually calls for a tenotomy of the inferior oblique of the opposite eye When fixation is maintained by the sound eye a shortening of the affected muscle gives the best result This is particularly true when there is a definite limitation of motility in its field of action

2 In Paresis of the inferior Rectus a shortening of the affected muscle is the operation of choice.

3 Paresis of the superior Oblique is usually an indication for a recession of the contralateral inferior rectus, although in some of these cases, a secondary spasm of

the inferior oblique of the affected eye is sufficient to warrant a tenectomy of this muscle An advancement of the affected muscle has also produced good results (Wheeler)

4 Paresis of the inferior Oblique can best be handled by an advancement of the affected muscle as described by Wheeler In selected instances a recession of the contralateral superior rectus may be the operation of choice

Another type of paralytic squint we frequently encounter is the secondary divergent strabismus that follows a crippling of the power of convergence In this type of case, where the divergence has become sufficiently marked to be a cosmetic blemish, a simple reattachment of the internal rectus is not sufficient Judging from my experience, these cases require a resection as well as a reattachment of the internal rectus, and in some instances it is even necessary to supplement this with a moderate recession of the antagonistic external rectus

The comitance test affords corroborative evidence on primary restriction or on secondary overaction in the different directions of gaze It is simply performed by selecting a card in front of the patient's nose in such a way that, in following the test object through the six diagnostic positions of gaze, he has to fix first with one eye then with the other This test is particularly useful in cases with a combined vertical and lateral squint, in bringing out the affected vertical muscle It thus aids materially in selection of the operative procedure necessary to remove the defect The *estimation of the convergence near point* is of service in helping us select the operation of choice in both convergent and divergent strabismus. An esotropia manifesting a marked spasmodic inshoot, on attempting to converge, certainly calls for a generous recession of the internal rectus When no such spasmodic inshoot exists, much greater caution must be used in receding the internal rectus An exotropia exhibiting no power of convergence requires more shortening of the internal rectus than does one with a good relative near point of convergence An exotropia with a normal near point of convergence is primarily due to a divergence excess, consequently the principal operative interference should be a recession of the external rectus Experience has shown however that unless some shortening of the internal rectus is also done an undercorrection results

Time of operation The author's views on the proper time for operation have already been set forth Therefore it is necessary only to reiterate that no arbitrary age limit should be set, and that operation should be performed when indicated regardless of the age It is my firm conviction that the vast majority of the deviations should be removed prior to the school age My reasons for advocating early operation are

1 A good functional result is more apt to be secured

2 Secondary muscular changes are less frequent in cases of short duration

3 Early removal of the cosmetic blemish is important from a psychological standpoint

4 Postoperative diplopia, if present, is more readily overcome in the young

Many objections are raised to early operation and chief among them is the necessity for the use of general anesthesia This objection to my mind is largely theoretical, for if one carefully analyzes his case preoperatively, he can usually determine beforehand the amount and character of the operative interference needed for its correction Of course he should be prepared to vary this plan, if unusual muscular conditions are found at operation, which possibility should always be borne in mind Operating under a local anesthetic has certain disadvantages that are not usually considered *First,* let me remind you that when only local instillations are used it is difficult to secure a satisfactory shortening because of the accompanying discomfort The patient is tense, and often holds his breath, with a resultant increase in bleeding, all of which add to the difficulties of the operation Based upon such experiences, it is now my policy to use either a general anesthetic or a cone injection when a liberal shortening is desired *Secondly,* when orbital injections are employed, the extraocular muscles are partially or completely paralyzed, therefore, it is no longer possible to judge accurately the effect of any given procedure It seems to me that in the aver-

age case a general anesthetic should be employed

Operative technic A great deal of needless discussion has been held over the virtues and values of certain operative technics There are many methods of shortening or strengthening a muscle, any one of which will be entirely satisfactory if properly performed Select the procedure with which you feel most competent and perfect your technic in that particular method Each method has some advantages and some disadvantages over the others My personal preference for shortening or strengthening a muscle is the *resection* advocated by Reese It seems to me that this method embodies most of the advantages and fewer of the disadvantages than do some of the other technics It is easy to perform, and if one is liberal in the amount of muscle removed, just as effective as an advancement Furthermore, should a thickening occur at the site of attachment, it is several millimeters removed from the limbus and hence much less unsightly Judging from my experience, properly inserted sutures give way so infrequently, one need consider this possibility only as the rarest of complications If this be true a resection is to be desired over a tucking Infection is another rare complication largely attributable to improper closure of the conjunctiva.

When a lengthening operation is to be chosen, my personal choice is the *recession* The uncertain results that followed uncontrolled tenotomy have been largely responsible for the widespread adoption of some form of scleral anchorage I formerly felt that tenotomy of the external rectus was a harmless procedure This was a mistake, which I now readily admit, for I have seen an annoying paresis follow a complete tenotomy of this muscle Recession is a great improvement over tenotomy but let us not be too liberal in the amount we recede an attachment Too enthusiastic approval of this valuable operative procedure will also lead to disastrous results Many convergent squints of fairly high degree can be rendered cosmetically straight by a generous recession but are left with an inability to converge This in turn is often the forerunner of a secondary divergent strabismus Furthermore, too much recession of the external rectus is liable to be followed by a limitation of outward motility which, if not distressing to the patient, is very noticeable to his friends In the foregoing analysis, emphasis has been placed upon some of the conditions in which a liberal recession is contraindicated

There are many methods for receding a muscle satisfactorily, most of which have inconsequential differences The technic I have employed for the past few years has worked very well and is as follows

After a vertical incision in the conjunctiva at the point of insertion of the muscle, an opening is made in Tenon's capsule and the muscle is exposed The conjunctiva is dissected well back The lateral attachments are cut along the upper and lower borders of the muscle. The shank of a strabismus hook is passed under the muscle in order to spread out the tendon A suture is passed through the tendon near the center, close to the insertion, and worked in and out in a vertical direction through the upper half of the tendon, emerging near the upper edge. Another one is placed similarly through the lower half The tendon is then severed as closely as possible to its attachment. With a pair of calipers, previously set at the amount of recession desired, a faint scratch is made on the surface of the sclera, parallel to the original insertion This impression marks the point at which our new attachment is to be made While fixation is maintained on the lower end of the stump, the lower suture is passed through the episcleral tissues at this point, in line with the lower border of the original insertion The upper border of the stump is then grasped and the upper suture is passed in line with the upper border These sutures are then tied This simple technic gives a wide attachment that can be thoroughly inspected before closure of the conjunctiva This is done separately with interrupted sutures

The suture material used in all muscle work is 0000 ten-day chromic catgut on atraumatic needles It has proven entirely satisfactory both for the resection and recession operations The conjunctiva is closed with the same material A most important point in all muscle operations is accurate and tight closure of the conjunctiva This materially reduces the chances of infection, and prevents the annoying granulomata so frequently encountered when this precaution is not observed It has seemed sufficient to bandage only the

operated eye The operated eye is kept under a dressing for approximatly a week It is usually changed every forty-eight hours Glasses are to be worn as soon as the dressing is discontinued, if the refractive error warrants a correction Atropinization of both eyes is desirable in cases of high hyperopia immediately after operation and is continued until the glasses can be worn It is not, however, a routine procedure for all cases

Summary

The successful surgical treatment of strabismus depends chiefly upon a careful preoperative analysis, which should include all information that will aid in the selection of the proper type of operation Among the most important preoperative steps are an accurate measurement of the amount of deviation present in the six cardinal directions of gaze, and, information on the near point of convergence Operate when indicated regardless of the age Slight variations in surgical technic are inconsequential and too much emphasis has been placed upon them Tight closure of the conjunctiva promotes prompt healing and lessens the chance of postoperative infection The technic for the recession operation, herein described, has proved most satisfactory

Discussion

Dr John F Gipner, *Rochester*—After hearing Dr Dunnington's paper, I find that I am in complete accord with everything he has said The reason for this is very simple We in Rochester, like most ophthalmologists in this country, have learned much of what we know about ocular muscle anomalies and their correction from the group of New York ophthalmologists who constitute what may be called, "The Duane School" Dr Dunnington and Dr White are outstanding members of this group That there should be any major disagreement between teachers and students is naturally not likely

Dr Dunnington has ably outlined the physical or mechanical, and the physiological aspects of the surgical treatment of strabismus He has emphasized the importance of correct diagnosis as the essential preliminary to the surgical correction of strabismus The estimation of what one should do must be clearly in mind before operating, and should only be altered, if at operation, one finds an unexpected condition of hypertrophy, atrophy or absence of the muscles involved

If you believe, as I do, that our ideal in the care and treatment of strabismus is the production of a functional as well as a cosmetic cure of the squint, then of necessity you must accept the responsibility of working diligently and skillfully with the young cross-eyed child If surgery is indicated, our corrections should certainly be completed before school age Dr Dunnington has listed the reasons why this is important The only possible exceptions to this course might be in those cases of true alternating strabismus as defined by Peter and in cases of congenital amblyopia which are not benefited by forcing the central vision in the squinting eye by total occlusion, or occlusion as nearly total as is feasible

My present opinion of alternating strabismus cases is this, that many of them will acquire binocular vision and often fusion if proper and intensive orthoptic training follows early corrective surgery, and that this group of cases can be reduced in number in proportion to the intensity of effort employed in reeducating these children When we fail to obtain binocular vision in these patients, I believe it is because the habit of alternate fixation has become firmly fixed in the child, whom we have not been privileged to see early enough, or, if the child has been seen early, that the orthoptic exercises have not been intensively practiced by the child after the operation The cause of lax exercising by the child is usually the apathy of the mother or the doctor

Dr Dunnington did not give us his opinion of orthoptics, although he did say that the presence or absence of fusion does not influence the selection of the type of operation I personally regard orthoptic training as a very valuable adjunct to the surgical treatment of strabismus, both prior to and after the operation I find it often as important as the proper handling of the physical and physiological phases of the problem For this reason I would add that some cases of strabismus require a careful preoperative psychological preparation for eye muscle surgery This psychological preparation may be as important as the thorough preliminary study of the mechanics and physiology of the strabismus which Dr Dunnington has outlined and stressed

Orthoptic training helps those cases which are slow to develop binocular vision and fusion, and saves many operative corrections from relapsing into strabismus again, by developing the will and desire to have binocular vision I feel very strongly that this desire for binocular vision is psychological and that it must be developed in many strabismic children We are apt to say that it is something that the squinting child either has or has not. Certainly many children have it to such a degree that realignment of the eyes alone produces binocular vision, just as in accommodative squint, glasses alone often enable the child to obtain binocular vision. But I am sure that there are strabismic children where the psychologic phase of the squint is most important.

The frequency of combined vertical and lateral deviations is also important. Of sixty strabismus operations done in the Strong Memorial Hospital during the school year from July 1934 to July 1935, operative correction of a vertical imbalance was necessary in one-third of the cases This high percentage can be partly explained by the fact that some of these cases had been saved up from the previous term to see Dr White who lectured here on strabismus in the summer of that school year Nevertheless, one cannot expect a correction of the lateral strabismus without paying proper attention to the vertical element, if it is present

I was impressed with the simplicity of the technic Dr Dunnington uses in the recession operation. For several years we have been using triple O catgut with atraumatic needles attached. We have found this method very satisfactory although the needles are often soft and become easily dulled We have used the threaded ends of the catgut, which are cut off after tying the recession knots, to close the conjunctiva by a running stitch It has been a great relief to avoid the fuss of removing non-absorbable sutures after muscle operations, not only in children, but also in adults The necessity of a short secondary anesthetic to remove sutures is completely eliminated.

Dr Dunnington's warning not to weaken the converging power excessively if the near point of convergence is poor cannot be too strongly emphasized Reoperations to correct secondary divergence are not only embarrassing but should be very largely unnecessary

DR FRANK M SULZMAN, *Troy*—The very excellent and carefully prepared paper that Dr Dunnington has given us leaves little to discuss as the points so well-covered are based on sound surgical judgment and experience.

It may be of interest to the junior members of this section to speak of some of the earlier papers on this subject presented to this section and also its similar section at the A.M A meetings when I first attended

Muscle surgery occupied an important part on the program and after an attendance of many years in which I can recall the keenness and intense spirit that was displayed in these early discussions on this subject as to the relative merits of the different procedures then advocated. Two distinct groups were usually present—everything depended on some special method and those that opposed these views Why they operated would provide an interesting review today in the light of our present knowledge on muscle work. Some of the senior members of this section will likely recall patients who gave them a history of twenty-thirty operations on their eyes

Today two or three is all that is required in a large majority of cases I have found these cases with a history of multiple muscle operations noted above extremely difficult to refract and obtain reasonable comfort afterward due to the complete change of the muscle balance of their eyes

Dr Dunnington very well emphasizes five points in preoperative examination that all would be wise to follow I must confess personally up to the present I do not always examine in the six cardinal points he mentioned He well states the operative procedure should be one you are familiar with To operate one case by tucking, another by resection, etc. I do not believe wise for any surgeon to follow To follow a few well understood surgical procedures as he states is wise and tends to yield better results

It was my good fortune to see the late Dr Reese many times at the Infirmary while he was developing and perfecting the Reese resection operation Many of us recall his enthusiasm and I had opportunity to see him do this operation many times I early became a firm believer in its value and for years it was my choice in strabismus cases Time and experience teaches us all I saw it had limitations in some cases and then used a resection by placing the sutures on a tenotomized muscle tightening these as occasion demanded This left more thickening than was desirable while the results obtained were good In the recession operation

we have a method that combines the correction of this objection and one that used with judgment finds a useful place among our operative procedures

In the selection of our operative cases the alternating divergent patients have been most trying and difficult because of the inability to fuse even after careful training and refraction The resulting diplopia in this type has always been annoying to me

Personally I prefer local anesthesia as I still follow the method Dr Reese always used—sitting the patient up, having him fix for distance and near Any error still present will determine further surgical procedure I have found that covering both eyes for the first twenty-four hours is valuable I believe we should have in mind that operation is not to improve vision, which should be definitely stated to the patient or if a child to its parents If this point is emphasized much misunderstanding will be prevented

With the lay propaganda now being spread in the schools and colleges regarding improvement of vision by orthoptic training, a distinct preoperative understanding of what we seek to accomplish by operation is a wise and timely precaution

IMPORTANT OTOLARYNGOLOGICAL MEETING

The Eastern Section meeting of the American Laryngological, Rhinological, and Otological Society will be held on January 7 at the Bellevue Stratford Hotel in Philadelphia, convening at 9 A M , Dr Samuel J Kopetzky, of New York, presiding The program

1 Remarks by the President.

2 "The Inner Ear from an Experimental and Clinical Standpoint" Walter Hughson, M D , Philadelphia, Pa (by invitation) Discussion by Harold Grant Tobey, M D , Boston, Mass , and William Hewson, M D , Philadelphia, Pa (by invitation)

3 "Petrous Apex Suppuration—When and How to Operate. Report of Cases" Robert L Moorhead, M D , Brooklyn, N Y Discussion by I Freisner, M D , New York, N Y and George M Coates, M D , Philadelphia, Pa.

4 "Problems in Diagnosis and Treatment of Hyperplastic Sinusitis and Allergy" E Ross Faulkner, M D , New York, N Y Discussion by J Alexander Clarke, Jr , M D , Philadelphia, Pa , (by invitation) and Dr Karl M Houser, Philadelphia, Pa

5 "Chronic Nasal Sinusitis and Refined Carbohydrate Selection" Edwin P Seaver, Jr. M D , New Bedford, Mass Discussion by D C Jarvis, M D , Barre, Vt.

6 Luncheon and Short Business Session

7 "Treatment of Tuberculosis of the Trachea and Bronchi" John D Kernan, M D , New York, N Y Discussion by Harris P Mosher M D , Boston, Mass

8 "Deep Infections of the Neck." Henry B Orton, M D , Newark, N J Discussion by Harris P Mosher, M D , Boston, Mass

9 "Pharyngo-Maxillary Infection Report of Cases" John R. Simpson, M D , Pittsburgh Pa Discussion by Oscar V Batson, M D Philadelphia, Pa , (by invitation) and Augus L Beck, M D , New Rochelle, N Y (by invitation)

10 "Meningitis of Otitic Origin Case Reports" Oram R. Kline, M D , Camden, N J Discussion by Walter Roberts, M D , Philadelphia, Pa , and Horace J Williams, M D , Philadelphia, Pa.

AMERICAN BOARD OF INTERNAL MEDICINE

The American Board of Internal Medicine will hold its next written examination on February 14, 1938 in various centers of the United States and Canada

The examination will consist of two sessions of three hours each with the morning session held at 9 00 A M and the afternoon session held at 2 00 P M

The candidates who are successful in this written examination will be eligible to take the practical examination which will be held in San Francisco the Friday and Saturday prior to the opening of the Annual Session of the American Medical Association in June

The final date for filing applications for this written examination is January 15, 1938 and all applications should be in the office of the chairman before that date

For further particulars and application blanks please address Dr Walter L Bierring, Chairman, American Board of Internal Medicine, Suite 1210, 406 Sixth Avenue, Des Moines, Iowa

RUPTURE OF THE URINARY BLADDER

Secondary to a Urethral Stricture

M R KEEN, M D, *Huntington* and A I GOLDSCHLAGER, M D, *Islip*

From a study of the literature, rupture of the urinary bladder secondary to a urethral stricture appears to be comparatively infrequent Commencing with Wehrle[1] in 1896, only nine adequately described cases have been reported To this number the following interesting case is deemed worthy of addition Its unusual feature lies in the fact that an extraperitoneal rupture occurred with secondary intraperitoneal involvement

Case Report

J C, aged sixty-three, had been complaining of difficulty in urinating for several months About twenty years ago he had had a gonorrheal infection with an uneventful course His wife had a four plus Wassermann, when examined about a year previously He was addicted to alcohol About a week before admission to the hospital the patient had seen his family physician complaining of difficulty in urination At that time a dense degree of stricture of the bulbous urethra was diagnosed He was advised to return for urethral dilatation but failed to do so

On the day of admission (February 10, 1936) to the Southside Hospital, Bay Shore, L I, he was found at home in a semicomatose condition He had been attempting to treat himself and had been apparently unable to get outside help It was impossible to determine the length of acute illness He was irrational and looked septic

Physical examination revealed a white adult male, about sixty years of age, emaciated and toxic The head and neck were essentially negative. The thorax showed increased amplitude of respiration There was flatness on the right side The infraclavicular area presented coarse bronchovesicular breathing Many fine and coarse rales were heard throughout both lungs The patient coughed continually The heart was not enlarged, the rate was rapid but there were no murmurs Pulse was barely perceptible, and about ninety per minute The abdomen was distended The lower abdomen from symphysis to umbilicus was rigid, indurated, and tender to touch The urethra presented a dense impassible stricture at the bulbomembranous junction Scrotal contents were normal to palpation Rectal examination revealed a small soft prostate with a superimposed area of doughy resistance The knee jerks were sluggish and the extremities very cold The temperature on admission was 96 2° F

The impression was one of sepsis following extravasation of urine, bronchopneumonia, and exposure

The bladder was immediately drained by means of a trocar and the patient prepared for operation by means of saline and glucose both intravenously and hypodermically Operation was performed the following morning

Operation (Feb 11) Under gas and oxygen anesthesia, a four-inch incision was made from the pubic area to the umbilicus in the midline. The recti muscles were separated, necrotic fat and pus were encountered directly over the bladder The peritoneum was thickened and adherent to the bladder dome The bladder was incised and about a pint of urine aspirated A No 26 mushroom catheter was inserted Palpation of the bladder cavity revealed no other point of rupture The recti muscles were found to be necrotic Further exploration of their sheaths revealed necrotic rents along both lateral margins opening into the peritoneal cavity on both sides

The peritoneum was incised and drained and eight ounces of pus and urine were removed The wound was closed in layers with drainage tubes inserted intraperitoneally and extraperitoneally

The postoperative diagnosis was rupture of the bladder, extraperitoneal with intraperitoneal extension

Blood count on Feb 11 was Hemoglobin seventy-five per cent RBC 3,600,000, leukocytes 12,300, small lymphs twenty-two per cent, and polymorphonuclear neutrophiles seventy-eight per cent.

Blood Chemistry on Feb 12 was Creatinine 2.3 mgs per 100 c.c, urea nitrogen twenty-five mgs per 100 c.c.

Progress Notes

Feb 12 Patient is in a very weak condition The infusions of glucose and saline have stimulated the patient sufficiently within the past two days so that he is showing some temperature reaction in contrast to his admission temperature of 96° F However, the increase in his body temperature has also served to increase the amount

of absorption both from his peritoneal cavity and abdominal wound The patient is becoming more and more septic The cardiac rate is extremely rapid He is greatly dyspneic and is failing rapidly from shock The urinary output is considerable

Feb 13 Temperature is mounting each hour The pulse is of poor quality Respirations have become more dyspneic and labored Patient does not react to questioning and his exitus is only a matter of a few hours However, intensive treatment with glucose intravenously and saline by clysis is being continued The heart is being supported by digitalis medication His pneumonia is rapidly getting worse There is marked bronchial breathing throughout the right side, but no large areas of consolidation It is questionable as to which is causing more sepsis, the pneumonia or the abdominal extravasation of urine

Feb 14 Patient died this morning Terminal temperature 106 2° F *Diagnosis* was acute bronchopneumonia, rupture of bladder following urethral stricture, extravasation of urine, and peritonitis

Postmortem (Examination of wound extra- and intraperitoneally) Permission was granted for exploration of the abdominal wound only The abdominal wound showed signs of only slight organization On opening the sutures and exposing the abdominal wall, a mass of foul, necrotic material and pus exuded The bladder was ruptured anteriorly and adherent to the abdominal wall Urine found in the bladder was fairly clear The peritoneal cavity was explored on the right side and a small amount of fairly clear fluid was found On the left side an organized cul-de-sac was present extending over the roof of the bladder containing some free seropurulent fluid The walls of this sac were composed of great omentum The course of extravasation apparently was as follows Suprapubically and through sheaths of the recti muscle and then laterally into the peritoneal cavity, an attempt on the part of the greater omentum to wall this off was ineffectual

The lungs were not explored

Discussion

The term "spontaneous" rupture is *per sé* deceptive, implying as it does a lack of motivating force Stone[2] in his excellent treatise defines such a rupture as "an evacuation into a closed cavity of which only two are accessible, namely the pre-vesical space and the abdominal cavity The term "spontaneous" should be applied to those cases resulting from pathological changes in the wall of the bladder or obstructive lesions of the bladder or urethra, irrespective of the presence or absence of pathological changes in the bladder" Sisk and Wear[3] look upon spontaneous rupture as occurring without external stimulation Others[4-6] find it difficult to conceive of perforation without force While such a force may appear trivial or unnoticed, careful scrutiny always produces evidence of some stress or strain The inherent strain arising from fluid under pressure (distended bladder) may be considered a true hydraulic force Similarly an increase of intra-abdominal pressure can be precipitated by sudden lifting, rising, defecation or parturition Such cases have been reported[7 8] A lesion of the bladder wall (neurogenic, congenital, inflammatory or neoplastic) is obviously a silent contributing factor in the mechanism of bladder rupture To these factors, a loss of sensorium because of alcoholism rounds out the picture An obstruction to urinary outflow is assumed It is felt that the term "spontaneous" rupture of the bladder should apply to an infiltrating malignant or infective process, which of itself would create a channel to the extra- or intraperitoneal spaces

Table I presents a survey of cases reported in the literature of bladder rupture following urethral stricture

Whether the rupture occurs extra- or intraperitoneally, is obviously dependent on the site of the bladder tear Partial lacerations of the bladder wall are infrequent The tear usually occurs through all layers Gesinger[5] has suggested that an intraperitoneal rupture may be due *first* to the arrangement of the muscle fibers of the posterior surface of the bladder, and *second* to the fact that the only covering is the peritoneum Bone and muscle protect the bladder elsewhere Besley[4] has shown that a rupture takes place at the weakest point in the bladder but that this point is not always anatomically the same Experiments in distending the bladder[4 9] (Besley, Staubenrauch) reveal no constant relative order in which the coats tear Campbell's[10] review of a series of fifty-five cases of bladder rupture from numerous causes found that most tears occur in or near the dome of

the bladder These are usually long or multiple rents of either a T, Y, or U type offering extra- and intraperitoneal egress In an exhaustive clinical study, Bartels[11] however concludes that the tears most frequently are in following order

1 Anterior wall (left or right)
2 Posterior, superior angle
3 Posterior, inferior angle
4 Junction of neck of bladder and body (rare)

ally by way of perforation close to the umbilicus No case could be found in the literature in which such a mechanism was proven at autopsy Our own case illustrates an extraperitoneal tear of the bladder wall extending laterally into the peritoneal cavity

Signs and symptoms have been adequately discussed by others Early in the course there is a strong desire to void with inability to do so With the actual

TABLE I

Author	Date	Age	Type of rupture	Details	Operation	Result
Wehrle[1]	1896	37	Intraperitoneal	Urethral stricture. Diagnosis not made. Autopsy revealed tear in bladder mucosa and muscle (1 5 cm.) situated at posterior surface in fundus of the bladder	None	Death
Besley[4]	1907	49	Intraperitoneal	Rupture occurred following fall in street. Tear (large) ragged in fundus, reaching on left side to rectum. Alcoholism	4 hrs. after admission	Death
Coff (quoted by Baumer)[16]	1913	?	Extraperitoneal	Rupture occurred following physical exertion No delay in diagnosis	Yes	Recovery
Dupouey (quoted by Baumer)[16]	1913	?	Intraperitoneal	Insane patient Stricture known for some time Following effort to void the patient lost consciousness and died six hrs. later *Autopsy*- laceration five cm. in length found at posterior wall of the bladder Histological examination revealed hypertrophy of wall, no degeneration seen	None	Death
Michel (quoted by Baumer)[16]	1913	?	No details given			
Lehmann[17]	1922	39	Intraperitoneal	Severe pain in abdomen. Urinary retention, diarrhea, fecal vomiting, two days. Rupture found at superior, posterior angle	Laporotomy Cystotomy 7 days later	Death
Williams[14]	1927	48	Extraperitoneal	Slow rupture of bladder Site in bladder wall near right pubic bone. Bladder wall thin and friable. Nature cured this man by permitting formation of multiple scrotal fistulae through which the urine drained	Plastic	Recovery
Snk & Wear[3]	1929	37	Extraperitoneal	Suprapubic mass watched for three days. Anterior bladder wall necrotic and urine seeping through multiple small openings	72 hrs. after admission	Recovery
Sonfer[13]	1936	51	Intraperitoneal	Patient delayed operation Operated thirty-two hrs. after retention. Urethral scrotal fistula (traumatic) present	11 hrs. after rupture	Recovery
Lazarus and Rosenthal[6]	1936	48	Extraperitoneal	Suprapubic dullness, scrotal enlargement. Bladder wall thick. Tear occurred anteriorly Eight days after operation, multiple abscesses of right kidney developed and were successfully treated by decapsulation	24 hrs. after rupture	Recovery
Keen & Goldschlager (Present case)	1937	63	Extra- and intraperitoneal	Derelict — bronchopneumonia, alcoholism, lues, exposure. In shock on admission. Immediate trocar drainage of bladder with improvement of patient. Cystotomy and drainage. Tear located anteriorly, occurred at least three days prior to admission	12 hrs. after admission	Death

A urethral stricture first produces hypertrophy of the bladder musculature, later leading to atrophy If an associated infection is present, the tensile strength of the musculature is further weakened Coexistent primary changes in the bladder may accelerate the incidence of bladder perforation

Bogart[12] in an extensive article concludes that the posterior superior portion of the bladder is the most vulnerable point of rupture because the muscle support is weakest there Harrison[13] discusses the possibility of an extraperitoneal rupture extending intraperitoneal tear the patient may experience a sensation of tearing or something giving way in the lower abdomen Occasionally he may refer this sensation to the heart Pain may be constant and precipitate collapse On the other hand, sudden relief of symptoms such as urgency and abdominal pain may be the first indication of actual bladder perforation

With extraperitoneal involvement there is also lower abdominal tenderness and rigidity A mass may be palpable through the rectum or vagina if the tear is intraperitoneal With extravasation of urine into the tissue there is toxic absorption

Signs of sepsis are evident (chill, high pulse, irregular temperature) If the rupture is very slow, scrotal sinus formation may take place Such a case is reported by Williams[14] in a forty-eight year old male who presented multiple scrotal fistulae originating in the anterior bladder all close to the right pubic bone

With intraperitoneal involvement there are the signs of peritonitis and free fluid in the abdomen An infrequent but important sign is the presence of a bluish tinge about the umbilicus (Petersens) This may occur as early as six hours after rupture

All authors agree as to the difficulty of early diagnosis Cases have been reported at autopsy If possible a careful history plus the signs and symptoms mentioned above may help

If a catheter can be passed, a cystogram with the use of an innocuous filling medium (Hippuran, etc) is of great aid No harm can result from the procedure as immediate surgical drainage invariably follows In early cases, intravenous pyelography may help at times Late cases exhibit renal inhibition and make the procedure valueless

Filling the bladder with a measured amount of fluid and measuring the return is an unreliable procedure

The injection of air into the bladder[15] with x-ray visualization of a subdiaphragmatic localization (intraperitoneal) or the dissemination of air through the fascial planes (extraperitoneal) should prove valuable We have had no experience with same The possible danger of air-borne bacteria to subdiaphragmatic spaces must be considered

In this series of ten cases of bladder rupture associated with urethral stricture, the mortality for intraperitoneal rupture was eighty-four per cent Only one case recovered following drainage

The extraperitoneal ruptures (4) all recovered, three following surgical drainage, the other through multiple scrotal sinuses The latter were excised successfully following cystotomy and urethral dilatation

Our case of extraperitoneal rupture with intraperitoneal extension died

Surgical drainage, prompt and adequate, is the only treatment Actual suturing of tears should be performed only when practical Intraperitoneal tears require prompt drainage although the only recovered case submitted to operation eleven hours after diagnosis Extraperitoneal tears can go without relief as long as seventy-two hours, with recovery

Conclusion

Ten cases of bladder rupture secondary to urethral stricture have been reviewed These are evenly divided into extra- and intraperitoneal groups

A case of spontaneous, extraperitoneal rupture of the urinary bladder is reported with further intraperitoneal involvement This was complicated by bronchopneumonia occurring in a patient living alone There was a history of a gonorrheal stricture, lues, and alcoholism The kidneys responded immediately to bladder drainage and intravenous fluid therapy Uremia was not a factor in causing death The patient lived more than seventy-two hours after extravasation of urine before treatment could be administered (as judged by operative findings)

The course of the extravasation in this case was unusual The bladder tear occurred at the anterior portion (extraperitoneally), the necrotic process extending into the recti muscles anteriorly At operation the exploring hand could be passed from the site of the rupture along the lateral surfaces of the bladder on either side and thence intraperitoneally

ROLE OF FOOD ALLERGY IN DISEASES OF THE SKIN

J GARDNER HOPKINS, M D, *New York City*
From the Department of Dermatology, College of Physicians and Surgeons, Columbia University

The disorders which we call allergic are most varied in their manifestations, but are included in that category because they seem to be based on the same or similar fundamental processes The more their mechanism is elucidated the more similar seem the processes concerned in all cases The nature of the reactions and especially the course which they follow are influenced greatly by the nature of the allergenic substances It is useful and customary to divide these substances into three groups

1 Proteins such as occur in foods, pollens, and epidermal substances These are practically nontoxic for unsensitized animals

2 The bacterial proteins which differ somewhat from other proteins in the type of allergic response which they elicit These bacterial proteins are more or less toxic for normal animals

3 Nonprotein substances which are incomplete antigens and probably sensitize only after combination with the body proteins of the individual sensitized

The differences between the reactions caused by these three types of antigens may not be fundamental, but are at present of practical importance

The type of antigen does not, however, determine the type of clinical response Asthma may in one individual be due to a food or epidermal protein, in another individual to a bacterial protein, and in a third to a nonprotein substance such as aspirin The same is true of urticaria and of the inflammatory lesions of the skin which we call eczema or dermatitis Conversely, egg may cause asthma in one individual, urticaria in another, and eczema in a third

The variation in symptoms which different individuals present after reaction to the same antigen is generally explained on the hypothesis that different tissues are sensitized It is known that in contact dermatitis certain areas of skin are more highly sensitized than others These are usually areas which have been most exposed to the allergen It seems plausible, therefore, to suppose that hay-fever is caused by sensitization of the nasal mucosa, asthma by sensitization of the bronchi, and dermatitis by sensitization of the skin

May I remind you of familiar experimental findings that seem illustrative of the phenomena we observe clinically?

Guinea pigs injected with appropriate doses of certain food proteins can be sensitized so that a second injection after an interval of ten or more days causes anaphylactic shock The serum of animals so actively sensitized contains precipitins specific for the protein used and when injected into a second pig, passively sensitizes it so that it in turn will react in an anaphylactic manner The smooth muscle of the uterus or intestine removed from an actively or passively sensitized guinea pig reacts violently on exposure to the antigen indicating that antibodies are present in certain tissues as well as in the serum Injection of sublethal doses of antigen into a sensitized guinea pig desensitizes the animal for a period so that neither it nor its excised organs react anaphylactically

These phenomena are more easily demonstrated with some foods such as egg-white than with others, but the reaction of the guinea pig to all nontoxic foreign proteins seems to follow much the same laws

However, in each species of animal the phenomena of sensitization differ The reactions of the human present many similarities to and many differences from those of the guinea pig Let us examine them

As an example, take a young child in whom the eating of egg causes vomiting and diarrhea or eczema or urticaria The studies of Schloss and his coworkers[1] have shown that foreign protein may be absorbed unaltered from the intestine so that eating a protein may be equivalent to the injection of minute amounts Eating egg produces the symptoms referred to Introduc-

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 28, 1936

tion of dilute egg protein into the skin of such a sensitized infant usually causes a prompt local wheal indicating that the skin tissue is sensitized In some cases injection of the protein has caused shock and even death, and eating may cause severe collapse The child's serum can often be shown to contain antibodies because its injection into the skin of a normal person usually passively sensitizes the injected area A wheal will appear if this area is later tested with egg and sometimes if the normal person eats egg When the child grows older he can usually eat egg without symptoms and may give a negative skin test. Such apparent desensitization may be accomplished (though more easily with other foods) by feeding amounts too small to cause any reaction and gradually increasing them All this seems quite analogous to what happens in a sensitized guinea pig

On the other hand there are differences between the phenomena of allergy in man and anaphylaxis in the guinea pig Precipitins cannot be demonstrated in the serum of allergic humans Most efforts to passively sensitize guinea pigs with human serum have failed although the evidence is somewhat equivocal Moreover it is often difficult to determine how humans become sensitized While some individuals develop their first symptoms long enough after first eating a food to permit the assumption that they have been sensitized by previous exposure, others seem to react on first exposure Some infants for example seem to be born sensitized and some older persons react to a food the first time they are aware that they have eaten it Must we regard this as a freak of inheritance or is there some rational explanation? The mother may not be sensitized to the protein to which her infant reacts, Bell and Eriksson[2] could not find the antibodies of the mother's serum in the serum of her infant It seems unlikely therefore that these infants are passively sensitized On the other hand, Ratner[3] and his coworkers have shown that foreign proteins can pass the placenta It seems then a reasonable hypothesis that these congenital allergics have been actively sensitized by food eaten by the mother

At least the assumption that human allergies follow the general laws of experimental anaphylaxis helps us to understand many of the phenomena we observe in our patients

Food Allergy

One may make certain generalizations in regard to food allergy which it is useful to remember

1 There is a hereditary tendency to become sensitized The family history will usually show that relatives have suffered from food allergy or some other form of protein sensitization The hereditary influence seems not to extend to the sensitization of any particular tissue or to any individual protein, but merely to increase the tendency of certain strains of humans to become sensitized to proteins It is doubtful whether the same heredity increases their tendency to become sensitized to bacterial proteins or to nonprotein antigens such as poison ivy

2 Allergy to any given food usually appears soon after that food is first eaten allergy to egg, milk, wheat, and other common foods in the first year and allergy to shellfish and unusual foods in adolescence. There are apparent exceptions to this, but they are few

3 Most patients gradually become desensitized The child who in infancy cannot tolerate milk, can often take it without symptoms in later childhood However, certain highly sensitized individuals remain intolerant throughout life This occurs more frequently in those who show shock symptoms and in those sensitized to certain antigens, especially fish, shellfish, and egg

4 After a patient seems desensitized his reactivity to the old antigen may recur when he becomes sensitized to a new antigen As an example, a patient sensitive to milk in infancy and nonsensitive to milk in later childhood, again became sensitive to milk during an attack of ringworm dermatitis Such "anamnestic" reactions may explain the apparent initiation of some food allergies long after the food was first taken

5 Patients show a sequence in sensitization to different antigens After being sensitized to one food they tend to become sensitized to new foods and then to proteins that they inhale, such as silk, pollens, molds, and other dust constituents

6 They show also a sequence in sensitization of different tissues Infants with eczema usually have gastrointestinal symptoms and are likely later to show other allergic symptoms such as asthma, hay fever, migraine or shock.

7 In the same patient, different tissues may react to different foods A patient may have eczema from milk and asthma or urticaria from egg, although others develop

eczema, urticaria, and asthma all from the same food.

8 Foods cause reactions in the skin after absorption from the intestinal tract. To cause the skin to react, it is necessary to rub the allergen into a scratch or inject it intradermally, the response is an immediate urticarial wheal, rarely a delayed erythema, and not a dermatitis Foods rarely penetrate the unbroken skin They practically never cause positive patch tests These phenomena are probably due to the fact that the active portion of most foods is a water soluble protein to which the horny layer of skin is impermeable, but which can penetrate the mucous membranes under certain conditions

There are a few exceptions to these rules which should be noted Foods occasionally seem to cause reaction by contact with the thin skin of infants as evidenced by circumoral dermatitis Exceptionally food seems to cause a contact dermatitis in adults as in the cases of bakers' dermatitis and in other conditions where foods are rubbed into skin abrasions

The above rules apply not at all to the oily constituents of food, as the oil of orange peel or cinnamon oil These, like other oil soluble partial antigens, cause typical contact dermatitis and give positive patch tests

Dermatoses Caused by Food Allergy

A number of dermatoses have been attributed to food allergy

1 Urticaria The most common type is acute urticaria which usually begins in adolescence. The attacks usually last from six to twenty-four hours, but may be prolonged for a week or more. They usually follow eating of some unusual food. Those most commonly causing urticaria of this type are fish, shellfish, strawberries, and nuts We have noted cases from mustard, celery and other foods, but they are less common To the second type of urticaria belong the acute attacks which accompany eczema or asthma These begin usually in infancy and are caused more often by more common foods such as egg, milk, codfish or tomato The evidence that these urticarias are due to food is quite convincing as the outbreaks appear quickly and almost invariably after eating the same food and quickly subside on its withdrawal The sequence of events is so obvious that the patients usually make their own diagnosis

Urticaria is of course a symptom of many conditions, some of which seem quite unrelated to allergy Chronic urticaria is not often due to food, although one occasionally finds that food is one of the causes of a quick succession of outbreaks or that certain foods appear to make the urticaria worse. As a rule, however, in chronic urticaria one should think of bacterial sensitization first and of food as almost the last possibility [4]

Papular urticaria which frequently occurs in seasonal attacks in young children presents a peculiarly difficult problem Although the history often suggests allergy and the patients may give positive skin tests it has been impossible to show that foods or other antigens affect the eruption. Walzer[5] has published an excellent study of this problem

2 Angioneurotic edema This seems to be merely a special form of urticaria and the two types of lesions frequently occur simultaneously from the same cause Cases of pure angioneurotic edema where there is recurrent swelling of the eyes or lips are rarely due to food. Generalized edema due to sensitization to food has been observed in rare instances

3 Eczema Allergic eczema almost always begins in infancy and usually in the first year of life It is extremely common and the clinical picture of an exuding, itching eruption beginning on the cheeks and extending to other parts of the body until it may become universal is only too familiar In many it disappears spontaneously in later childhood In a limited number it recurs during early adolescence with a somewhat different, but equally characteristic appearance The areas then most markedly involved are the face, neck, elbow flexures, and popliteal spaces In acute exacerbations it may be vesicular and weeping, but is more often dry and lichenified and papular These adolescent cases are often classified under the unfortunate designation of disseminated neurodermatitis, a term which obscures the fact that they are actually late developments of the same disease called allergic eczema in infancy

Practically all of the allergic eczemas in infants are due to sensitization to food as may be shown by their disappearance on rigidly restricted diets and the exacerbations which occur when the particular food or foods to which the infant is sensitized are eaten Proof of this has been frequently presented [6] The foods most frequently responsible for infantile eczema are egg, milk, wheat, orange, tomato, chocolate, spinach oat, potato, and cod The often accused fats and starches seem to have nothing to do with these eczemas, and sensi-

tizations to contact substances play practically no role When we say that infantile eczema is almost invariably due to food we obviously do not mean that a diaper rash is due to food or that seborrhea of the scalp or intertrigos of the groins and axillae are due to food These eruptions could hardly be mistaken for infantile eczema

Allergic eczema in the adolescent stage has probably the same basic etiology Practically all such patients were sensitive to foods in infancy A few recover completely on elimination from their diet of one or more foods and many have exacerbations after eating certain foods The majority, however, cannot be cured merely by restrictions in diet, and with some, diet seems to play no role This has led to wide differences of opinion as to their etiology It can be shown that many have become sensitive to other proteins, as silk, wool, dander, and pollen As such antigens are inhaled with dust it is difficult to protect patients from them Consequently the relationship of such sensitizations to their eczema is more difficult to establish than is the case with foods In many of these patients psychic stimuli also seem to excite the eruption It is evident too that important changes have taken place in skins which have been the site of a chronic inflammation for years and which are heavily infected with staphylococci These and possibly other factors make the practical management of these cases exceedingly difficult Their existence does not, however, invalidate the evidence that the disease is due primarily to allergy to proteins ingested or inhaled

4 Other forms of dermatitis Urbach[7] has described a case of weeping dermatitis of the extremities which seemed to differ from the usual type of allergic eczema and which he believed due to food sensitization It is quite possible that food sensitization may cause eczemas which do not conform to the usual clinical picture However, in dermatitis of the hands or feet, in fact in all cases which do not present the clinical characteristics of allergic eczema, one will do well to look for causes other than food

5 Aphthae Many patients attribute outbreaks of aphthae to the eating of special foods, particularly chocolate and nuts

6 Herpes Herpes simplex in some individuals occurs repeatedly after eating foods to which they are sensitized Herpes and aphthae can hardly be considered allergic reactions, but it is possible that such a reaction predisposes the patient to attacks by a virus which he harbors

7 Acne-form eruption White[8] has described eruptions on the face simulating acne due to sensitization to foods At the Vanderbilt Clinic, Kesten has observed similar pustular eruptions of the face due to milk and chocolate

8 Pruritus ani or pruritus vulvae Andreson[9] and also Rowe[10] and Drueck[11] have described cases of pruritus ani or pruritus vulvae attributed to sensitization to foods

9 Purpura and erythema multiforme There have been occasional reports of purpura or erythema multiforme or both occurring as reactions to specific foods Galloway[12] described such a case in 1903 and Engman,[13] Fordyce,[14] Hazen,[15] and others[16] have reported them since In most cases the lesions accompanied a severe gastrointestinal reaction There seems no doubt that such lesions can be caused by food, but the great majority are probably caused by allergy to bacteria or to drugs

10 Contact dermatitis from foods As has been shown above there are certain cases of occupational dermatitis in bakers which seem due to contact of the skin with wheat My associate, Kesten, has studied one such patient who is sensitive to wheat protein on skin test In this case either inhalation of wheat flour or rubbing of flour on the skin caused dermatitis of the hands and forearms The hands were, however, much excoriated and it is quite possible that the protein gained access only through such breaks in the skin Another possibility which was not excluded is that the eruption was not due to wheat protein, but to bleaching substances added to the flour which Mayer believes responsible for many cases of bakers' dermatitis We have also observed two cases of dermatitis of the hands in dietitians where the handling of food caused a dermatitis if the hands were abraded, but not if the skin was intact

One sees in infants transient outbreaks of circumoral dermatitis which definitely follow the eating of certain foods, especially tomatoes or spinach Urbach studied a patient in whom he could evoke an acute dermatitis by wiping the eyelids with eggwhite These are probably instances where a protein (possibly having special solubility) penetrated unusually thin skin and produced a reaction by contact In the infants referred to the eruptions resembled contact dermatitis and not eczema

Diagnosis of Food Allergy

As in most allergic diseases, the history is probably the most important aid in the diagnosis of food allergy In the allergic eczemas, the clinical appearance is also of great help

Skin tests are sometimes of real value,

but they have fallen into disrepute probably because so many have expected that by merely making skin tests, one could make an etiological diagnosis I have found many patients traveling about with a long list of foods which they dared not eat because positive skin tests had been reported, but in whom the eating of these foods seemed to produce no symptoms whatever More baffling are the cases which give a negative skin test, but are clinically definitely sensitive to given foods It is to be remembered, for example, that in acute urticarias of adults which are perhaps the most clear-cut examples of skin eruptions due to food allergy, it is rather unusual to find positive skin tests

Elimination diets are the most conclusive means of detecting food allergy, but are difficult to use and interpret It is useless to attempt them unless the patient regards his disease as a major problem and is willing to submit to considerable inconvenience and privation In allergic eczema the improvement following withdrawal of the responsible food is usually slow and one can rarely draw conclusions until after an abstinence of two weeks The most striking evidence is obtained by a recurrence of eczema after an allergen "thrust" The method is as follows

With a controlled environment the patient is placed on successive elimination diets until one is found on which pruritus ceases and the patient's eczema disappears Then goodly amounts of a common food are added at three to eight day intervals and the effect noted The one causing a recurrence of eczema is again eliminated and the patient's eczema again clears

This method has been extremely successful in the treatment of infantile eczema and urticaria and has demonstrated that sensitivity to common foods is a contributing cause of many cases of adolescent and adult allergic eczema The difficulties with the method are many and obvious, but nevertheless it seems the only reliable means at our disposal for the detecting of food allergy In severe cases the time and patience demanded by these tests is often well-rewarded [17]

In carrying out diet tests there are practical points which are helpful First of all tell the patient what to eat, then what not to eat For this the assistance of a dietitian is almost a necessity When common foods such as egg, milk or wheat are excluded the patient should be given lists of prepared foods that contain even small amounts of the substance he is trying to avoid The cooking of food rarely alters it sufficiently to prevent the patient's reaction (although it may occasionally be adequate) It is important to recognize the patient's preferences and to give as far as possible foods that are palatable A marked dislike for food is sometimes a clue in detecting sensitization When milk is excluded, especially from the diet of infants it is necessary to give some substitute The soy bean preparations, Sobee or the more palatable and better balanced Mullsoy are extremely helpful

Treatment of Food Allergy

In spite of the pages devoted to the local therapy of skin diseases due to food allergy, particularly allergic eczema, the only logical procedure is to determine the substances to which the patient is sensitive If patients are found sensitive to unimportant foods it is quite satisfactory simply to exclude these foods from their diet

When, however, as is more frequently the case, they are found allergic to egg, milk or wheat which enter into the composition of almost every meal and of so many common articles of food, permanent exclusion of the food from the diet is utterly impractical The oral method desensitization is useful in such cases It is simply an imitation of the method by which the majority of infants become spontaneously desensitized To succeed, however, in any scheme of desensitization it is essential first to rigidly exclude the food in question from the diet during the period of treatment which is usually prolonged over months If this is done, desensitization to common foods can usually be satisfactorily accomplished by feeding the substance daily in measured amounts beginning with mere traces The desensitization to egg seems peculiarly difficult and we have been successful in only a few cases The methods of oral desensitization have been described by my associates[18] and need not be detailed here

Summary

Cutaneous lesions resulting from sensitization to foods are part of the syndrome of allergy to nontoxic proteins They are often accompanied by cutaneous reactions to proteins other than food and by reactions in tissues other than the skin

The most important manifestation is allergic eczema In infancy, this is usually due solely to food allergy In adolescence, food allergy is often an important factor

Acute urticaria is often caused by allergy to food In chronic urticaria, foods are rarely an important factor

There is evidence that allergy to food causes other types of skin lesions, but our knowledge as to these is fragmentary

RAW MILK CAUSED 42 EPIDEMICS IN 1936

More than one-half of the 123,000,000 people in the United States are still consuming potentially dangerous raw, or unpasteurized, market milk even though the public health importance of milk pasteurization has long been established, Dr James A Tobey, New York scientist and health expert, told the annual convention of the International Association of Milk Dealers in Dallas, Texas, in October

Only about forty-seven per cent of the fluid milk produced in this country is pasteurized, it was declared by Dr Tobey, until recently Director of Health Service of The Borden Company The risk of epidemics due to contaminated raw milks of low grades is still very great he asserted

"In 1936 there were 42 epidemics of milk-borne diseases in the United States, involving 1547 cases of preventable diseases, and 28 unnecessary deaths, as reported by the United States Public Health Service," he said

"In every instance these unfortunate outbreaks of typhoid fever, septic sore throat, scarlet fever, and other communicable diseases were caused by infected raw milk of low grades The only gratifying feature about these epidemics is the fact that the number is less than the country's average for the past ten years, indicating a gradual improvement in the small town and rural milk supplies in which most of these outbreaks occur"

THE DOCTOR SHAKES DICE WITH DESTINY

A village doctor in the winter-bound mountains of Wales was aroused from midnight slumber by pounding at his door Miles away, the messenger said, a mother was in agony and it looked as though both she and her baby would die

The doctor fought his way through the snow drifts and the sleet for hours to get there by daybreak, relates Malcolm Bingay in *Hygeia* He delivered the child and saved the mother No thought of financial reward from that destitute family! Just a knight in the armor of his profession living up to the oath of Hippocrates

That was more than seventy years ago but that simple physician to the poor lived to know his reward of that night's struggle

When the guns were barking on the Western Front and the fate of the Empire was at stake, he saw it saved by the heroic decisions and the dynamic energy of that forlorn babe he saved to the world that morning

The child was David Lloyd-George.

ECHINOCOCCOSIS OF THE PELVIS

Report of a Case Involving the Right Broad Ligament

A J Raggi, M D, *New York City*
Visiting Gynecologist, St Vincent's and Columbus Hospital

Echinococcosis involves the pelvic structures relatively infrequently, whereas the liver, kidneys, and lungs are the most common sites of infection in the order named Echinococcosis occurs everywhere, but is especially found in certain parts of Central Europe and Iceland The adult tapeworm occurs usually in the upper half of the small intestine of the dog It can also occur in cats, wolves, and jackals The larval stage occurs in a large number of domesticated as well as wild animals—dogs, sheep, swine, and cattle in particular Man is an accidental host.

The pelvic organs are sometimes involved in the infection It is generally believed that in such cases the source of infection is from the rectum through its lymphatic channels It is also thought that a direct extension, as from the liver, may occur Primary pelvic hydatids in the female have their origin in the connective tissue immediately beneath the Pouch of Douglas From this point they spread to the broad ligaments and may come in contact with the uterus, ovaries, and tubes It is believed that the parenchyma is only rarely, if ever, the seat of the disease However, primary involvement of the uterus, Fallopian tube and ovary have been reported Primary retrovesical echinococcus cysts have also been reported

In the case I am reporting it could not be accurately determined whether the infection involved the pelvis through the rectal route or as a direct extension from an infected liver It is interesting to note that a cholecystectomy for chronic cholecystitis was performed only a few months earlier by another operator and no cysts noted at the time This appears to indicate a primary pelvic involvement

Case Report

E V, single, age forty-four, Italian-born, was treated for tapeworm in Italy at the age of eighteen Although unable to determine the type of tapeworm, she states that after a prolonged treatment a head was passed and recovery rapidly ensued Her present illness dates back some three or four years, when she began to suffer from backache and constipation This was shortly followed by gastric disturbances at more or less regular intervals In the past year pain in the right upper quadrant and epigastrium also accompanied her other complaints She also suffered from vague joint

Fig 1

pains and a feeling of fullness in the epigastrium In May 1935, a cholecystectomy and appendectomy were performed by another surgeon The pathological report was "chronic cholecystitis and appendicitis" No relief followed this operation She entered another hospital on July 21, 1936 and was discharged on August 4 with a diagnosis of "cyst or carcinoma of the ovary and cirrhosis of the liver with probable parasitic infection," with instructions to return later for a laparotomy She was admitted to the gynecological service of St. Vincent's Hospital on August 20, 1936

Examination revealed a well-developed woman Heart and lungs were negative. Small hard mass was felt in right upper quadrant apparently attached to the liver On vaginal examination a large soft mass, somewhat movable, filled the entire pelvis

Blood pressure 80/110 There was no elevation of temperature at any time.

Laboratory findings Essentially negative, except for eosinophilia of twenty-eight per cent G U and G I and X-rays negative, except for "redundancy and dilitation of sigmoid ascending transverse and descending colon visualizes with a barium enema"

Operation A large cystic tumor was found, apparently involving the entire right broad ligament, ovary, and uterus In order to remove the mass intact it was necessary to remove the uterus as well Fig 1 will give the reader a detailed picture of the gross pathology Another large cystic mass, firmly imbedded in the liver, was also disclosed In view of the extensive pelvic pathology it was considered prudent not to attempt the removal of the liver mass at this time

Pathological report "Specimen consists of a small uterus, the right tube and ovary and an interligamentous cyst measuring 4½x2½x2½" The cyst has displaced and compressed the ovary which is separated from the cyst by a distinct capsule On opening this cyst it is found to be filled with numerous daughter cysts which are distended with a cloudy fluid"

Microscopic "Sections show well preserved echinococcus cysts Outside the main cyst, there is a layer of ovarian tissue lined on the inner side by a deposit of chitinous granules, between which and the ovarian tissue is a line of subacute pyogenic inflammation with some foreign body reaction Microscopic examination of the cyst fluid shows numerous well preserved scoleces with numerous hooklets and some suckers" —Alexander Fraser, M D , Pathologist

The diagnosis was echinococcus cyst The patient made an uneventful recovery, but left the hospital on her own responsibility without submitting to further operation for the removal of the liver pathology The most interesting feature in this case is the fact that no demonstrable lesion indicative of echinococcosis was noted during the operation for cholecystitis a few months earlier, which leads one to suspect that perhaps the pelvis was primarily involved

MUCH CRY AND LITTLE WOOL

Does the showering of public funds on welfare agencies of all sorts really benefit the public health as much as the recipients of the shower would have us believe? The editor of the *Journal* of the Tennessee Medical Association thinks not He recalls that in the year 1936 welfare agencies of government, state and national, spent the largest sum of money that was ever spent in the history of the world in a similar period of time for relief and welfare.

It is logical to ask the question, "Did this enormous expenditure accomplish welfare?" Of course, the agencies responsible will show pictures and cite figures to prove that it did

The most reliable answer, he believes, is found in the gross mortality figures for the year 1936 A bulletin issued by the Bureau of the Census under date of June 7, 1937, shows that the registration area of the United States experienced the highest mortality in 1936 that has been experienced in seven years

"These figures indicate that the expenditure of money by welfare agencies appropriated out of the pockets of taxpayers does not always buy the welfare it was intended to buy The welfare agencies doubtless will demand still more money to be spent under their direction to buy welfare *It has not worked*"

TEN COMMANDMENTS FOR THE DOCTOR'S WIFE

She must *not* know the meaning of the word "jealous"

She must never gossip

She must run a cafeteria serving meals at all hours for her husband

She must be—like Caesar's wife—above reproach

She must have self reliance and self control

She must be able to think quickly and sanely in emergencies

She must be a diplomat, see all, hear all, say a lot, yet say nothing

She must learn to bear stoically and without complaint, disappointments in her personal plans

She must be a good mother and father because doctors are often too busy to discipline their own children

She must be a good "doctor" because doctors never take time to doctor themselves —*Northumberland County Medical Society Notes*

NEPHRITIC HYPERTENSION

Treatment with a Diuretic Agent Obtained from the Animal Kidney

BENJAMIN JABLONS, M D , *New York City*

Kidney extracts of various types have been used for a great number of years for the treatment of nephropathies and their complications These have been administered as whole kidney, in the form of kidney pulp or dried kidney powder, or in the form of pressed juice obtained both from fresh as well as autolysed kidney tissues [1] Watery extracts and saline extracts[2 5] have likewise been employed, mostly from fresh kidney Extracts made with boiling water have also been tried [13] Renal vein blood and its derivatives and kidney perfusates[5 6] represent another approach to this problem Attempts have likewise been made to extract by means of various solvents, substances from the kidney tissue, which exercised a potent effect on various physiologic functions, chiefly that relating to diuresis [10] Attention, however, was centered mostly on the effect of these substances on the blood pressure, both normal and increased, of laboratory animals and human beings

It has become increasingly apparent that this is not a method by which specific substances can be isolated There are so many bodies of a depressor nature present in animal tissue that it is difficult to separate them by this means and to attribute any specific character to them Some of these bodies have been identified chemically They belong, generally, into four large groups One is the choline group, *second* is the histamine group, *third* is the adenosine group, and *fourth* is the guanidin group These groups represent substances which are degradation products of nucleoprotein and therefore easily developed in all animal tissue [18]

In addition the multifarious functions associated with the animal kidney and its capacity to excrete hormonic secretions from other glands make it difficult to isolate a specific kidney substance unmixed with other associated hormones Attempts to separate these materials by exposure to high temperature such as that used in boiling aqueous extracts only served to destroy ferments as well as other potent hormonic principles The substances which would be retained by this method belong in the biogenic amine group This group is represented essentially by the four categories

We have found, however, that by protein precipitation utilizing alcohol which has been acidulated and by subsequent fractionation with increasing concentrations of alcohol and neutralization of excessive acidity by ammonium salt, we have been able to obtain a substance which, by chemical and biologic tests, fails to give a reaction for choline, histamine, adenosine, and guanidin [16-18] This substance, freed of lipoids, is apparently identical with the "nephrohormone" isolated by Tokumitsu[4] in Japan, from renal vein blood which has a physiologic effect similar to our substance, which we have named Tubulin Tubulin, similar to the substance isolated by Tokumitsu, has a very definite effect on the mobilization of chlorides in the blood stream and their excretion through the urine It also has an effect on cholesterol and other electrolytes which will be reported in a future communication

The literature contains numerous reports of conflicting results Extracts made by a method similar in some regards to that used in the isolation of insulin have failed to give consistent results An extract prepared by Wagner[12] under Dr Frederick M Allen's directions yielded a substance which gave variable clinical results We have felt that since attention has been paid to elimination of choline and histamine by meticulous observation of the directions of the method which is outlined below, results have been much more consistent In other countries apparently similar experiences have been recorded Gomez, in France, recently pointed out[23] that the reason for the contradictory results he

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

obtained was to be sought in the fact that the product prepared is usually not very well-defined and is relatively unstable since so many things such as temperature, pH, etc, exercise a deleterious effect Another reason is the fact that usually this extract as he prepared it contained toxic substances developing in the injured kidney or shortly after removal from the body, which yielded occasionally hypertensive substances

One factor which must be guarded against is the presence of products derived from autolysis of kidney tissue developing in the period of time elapsing between death of the animal and the extract preparation That this is not unimportant can be gleaned from comparison of the curves made in tests for the presence of histamine in extracts made from hog or beef kidneys which have been prepared immediatey after removal from the carcass and extracts made from kidneys which have been allowed to remain at room temperature for periods varying from three or more hours The time elapsing between the removal of the kidney from freshly-killed animals and its contact with the solution which prevents continued enzyme activity, determines the amount of choline and histamine present Our extract freshly prepared contained no choline or histamine We have been able to demonstrate that choline exercises a definite antidiuretic effect It is therefore evident that extracts which are not free from choline instead of being of value may either be indifferent or may even tend to aggravate a condition which already is considerably advanced

We have succeeded in preparing from the animal kidney an extract which is free, in a large measure, from many of these objections An acid alcoholic extract prepared from kidneys used immediately after removal from the body, or frozen to prevent any autolytic changes is free from toxic bodies in the dosage used and consistently hypotensive

This substance has been obtained by the following method of preparation

To a kilo of freshly removed hog kidney, which has been finely hashed, is added approximately eight liters of ninety-five per cent alcohol acidulated by the addition of concentrated sulphuric acid to a pH of about 3 0 (approximately 1/10 of 1%) The mixture is shaken and allowed to stand at room temperature overnight. It is then filtered through gauze and filter paper This filtrate is then passed through a filter containing ammonium carbonate, which serves to neutralize the sulphuric acid, and by the formation of ammonium sulphate helps precipitate any protein or proteose substances that have escaped precipitation by the existing alcohol concentration of eighty-six per cent. This clear filtrate is then reduced in vacuum to a volume to 700–800 c c at a temperature ranging from 10 to 24° C At this point, an insoluble residue separates out which is filtered off The remaining clear filtrate is placed in a refrigerator overnight and the lipoid substances settle out and are filtered the following day in the cold The clear filtrate, separated from the lipoids by refrigeration is then evaporated in vacuum to dryness at a temperature which is not allowed to go above 24° C This is then taken up in distilled water If this solution yields a precipitate with an excess of alcohol it is again taken up in nine volumes of ninety-five per cent alcohol and the precipitate separated as mentioned previously by filtration or centrifugation The supernatant fluid is evaporated down to dryness again, washed with acetone or ethyl ether, and the dry residue dissolved in distilled water so that one c.c is equivalent to fifty gm of original kidney tissue When properly prepared this extract has a pH 3 5–4 0, is clear amber yellow, and has a characteristic strong pungent odor It does not precipitate with sulphosalicylic acid, and is negative with the Biuret test

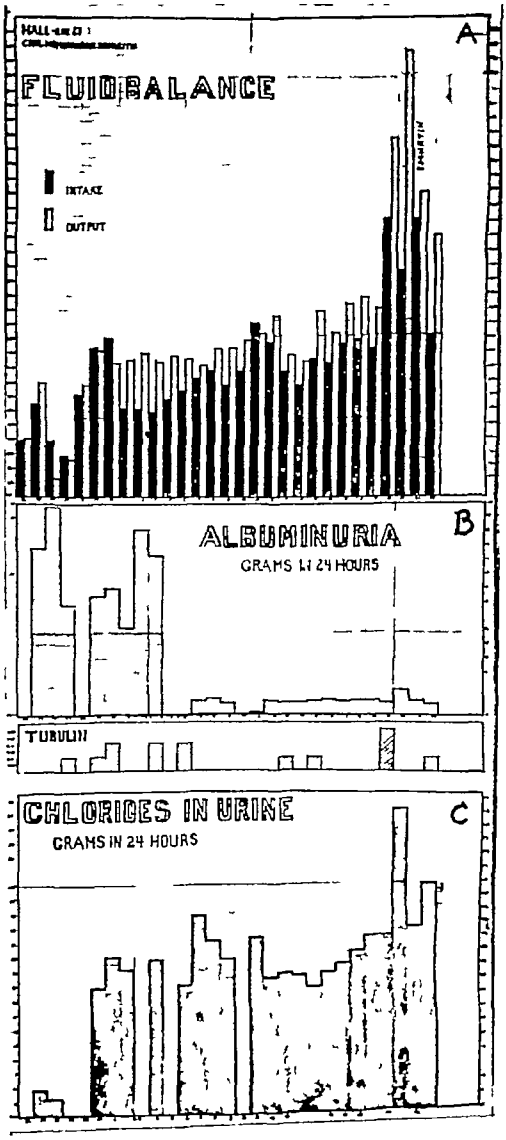
We attempted standardization at first by determining the amount of extract which would neutralize a given amount of adrenalin This was determined by injecting varying amounts of kidney extract with a fixed amount of adrenalin and noting whether the degree of rise in blood pressure was equivalent to the drop which either preceded or followed this rise However extracts which are not pure and which contain choline or histamine, are equally capable of producing this type of effect, particularly in dogs or cats In rabbits the histamine is supposed to produce a rise in blood pressure because rabbits are relatively insusceptible to histamine on account of their large content of histaminase This is not always true, as we have found, so we have discarded the rabbit as a test animal We have found, however, that kidney extract will neutralize the blanching properties

of adrenalin injected intradermally and have occasionally used this as a method of standardization At one time we considered the mobilization of chlorides as a method of standardization, but some extracts produce a definite drop in the chlorides of the plasma as well as of the whole blood Some recent work would seem to indicate that this drop in chloride is only present because of its association with sodium and that it is probably the sodium ion which is definitely affected. Considerably more work would have to be carried out to prove this point We have not attempted to prove the effect of kidney extract on the excretion of carbonates or the bicarbonate content of the blood, excepting that we have found increases in the alkali reserve of the blood plasma in human beings who had been treated with kidney extract

The injection of this material when properly prepared, free of histamine and choline, is relatively atoxic It has been injected intravenously in nine c c doses into a two kilogram cat and produced a slowing of the heart rate with a slight but definite increase in the P R interval but showed no toxic effects on the heart. In patients the amplitude of the Q R S wave was increased after its use Kidney extract injected into patients as well as animals, produces a very definite drop in the blood pressure, a fleeting but definite drop in plasma chlorides, excepting in patients or animals who have been given considerable amounts of salt previous to administration of the extract In those cases it would seem as if the result of the extract is in the nature of a mobilization since the blood contains an increased amount of chlorides which gradually drops, as compared with the chloride level existing previous to the injection of the extract

Studies of its diuretic effect have been made with this agent In animals and in some patients we have occasionally observed an effect on diuresis which is manifest in the first four or five hours after its administration In the great majority of patients, however, it does not act in this fashion This diuretic effect becomes evident sometimes within twenty-four hours and sometimes not for two or three days after its administration In Case 26 (Table I), the peak of the effect was reached one week after its administration was begun and represented an increase of 800% compared with what it had originally been

In Case 8 the diuretic effect was cumulative and did not manifest itself until forty-eight hours after its administration and increased slowly until three days later it had increased to approximately 200 per cent This effect remained until two weeks later, when it had increased 300 per cent, twenty-two days later it had increased 350 per cent, and twenty-four days later it had increased to 620 per cent, and on the twenty-fifth day after administration was begun had reached the astounding total of 770 per cent of the original amount It was found necessary at that time to attempt measures which would control both water and sodium chloride loss Intravenous administration of ten to twenty per cent sodium chloride solutions and eschatin were given, and on the day on which the excessive output was recorded salt excreted was 63½ grams



Used in conditions not definitely associated with kidney pathology but where oliguria was present because of some other cause, this agent has shown a diuretic effect In these individuals, the diuresis which followed lasted in some cases only a period of twelve hours whereas in other individuals it extended over a period of five days Because of the effect which we have noted on the salt excretion as well as the development of a syndrome which will be described in detail elsewhere we have found it necessary to administer fairly large quantities of salt, even to patients in whom the condition of the kidneys was such as to contraindicate its use in these amounts

A remarkable effect of the use of this material has been with patients in whom as a result of this material, the syndrome developed We have noticed that we could administer amounts of sodium chloride which would normally have been followed by the development of extensive edematous processes, without any such water retention taking place

In the case of D Y, suffering from chronic hemorrhagic nephritis, sixty-eight grams of salt was given over a period of one week, without this patient developing any edema, in addition to

which even a test of the P S P excretion given with 1000 c c of fluid failed to produce any pretibial edema S M I, who has been taking no treatment for the past nine months, with the exception of two injections given at monthly intervals in the last two months, is consuming approximately eight to ten gm of salt daily, without manifesting any edema

CHART I—Effect of Kidney Extract (Tubulin) on (A) Diuresis (intake and output) (B) Albuminuria total output (gm) in twenty-four hours (C) Chlorides, as sodium chloride (gm) in twenty-four hours With maximum diuresis, chloride output was 63 8 gm Use of Eschatin (10 c c) had only temporary effect on water and sodium chloride excretion

The diuretic effect of this material is particularly evident in Case 26, which can be seen from Table I, also from Charts I-II An important consideration in connection with the treatment of cases that have lost considerable amounts of salt, is the use of glucose intravenously It has been difficult to escape the impression that the effect of glucose administered intravenously in patients in whom the sodium chloride concentration has been markedly depleted either because of abstention from salt containing substances, because of repeated and copious vomiting, or because of the diuresis set up by the kidney extract, is fraught with considerable danger

In one of the earliest cases treated, (Case 17) the plasma chloride level reached the low figure of 388 mgm per 100 c c although he still excreted one gm of salt a day or less A sister of this patient, similarly treated, also showed a considerable drop of 140 mgm per 100 c c in the plasma chloride calculated as sodium chloride in a curve studied for three hours after the administration of kidney extract Her blood plasma chloride fell to 400 mgm per 100 c c from the normal 550–600 and her salt output in the urine suggested that the tissue depots were sadly depleted She also made a sudden exitus from cardiac arrest, which occurred about one-half hour following the administration of glucose intravenously We have observed this phenomenon in four cases, particularly where a uremic state existed

It has been shown by Sherill that death can be brought about in animals who with even low blood chloride levels can be made to excrete salt through the administration of substances which force diuresis, and we have seen that the diuretic effect of kidney extract manifests itself several days after its administration During the past year we have made it a routine practice to administer a minimum of four to eight gm of salt daily during the administration of the kidney extract We have noticed that where salt deprivation symptoms occur that even the administration of fifteen gm of salt daily for three days does not entirely relieve the symptoms The re-

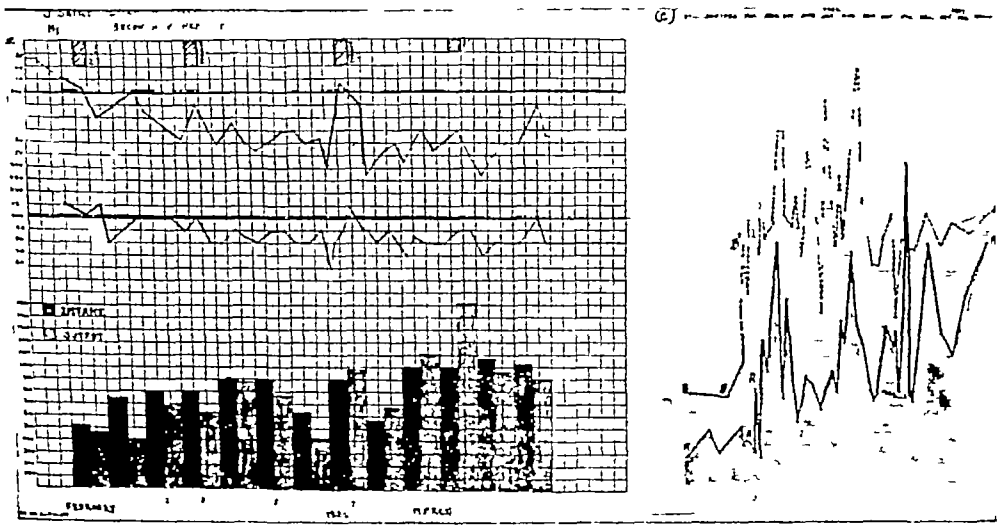


TABLE I—KIDNEY EXTRACT IN THE TREATMENT OF NEPHRITIC HYPERTENSION

Patient	Before treatment	During treatment	After treatment	Result

26	158/98	126/76(3 wks)	110/60(1–60 mos. later)	Improved

* Treatment discontinued. Relapse with fatal termination.

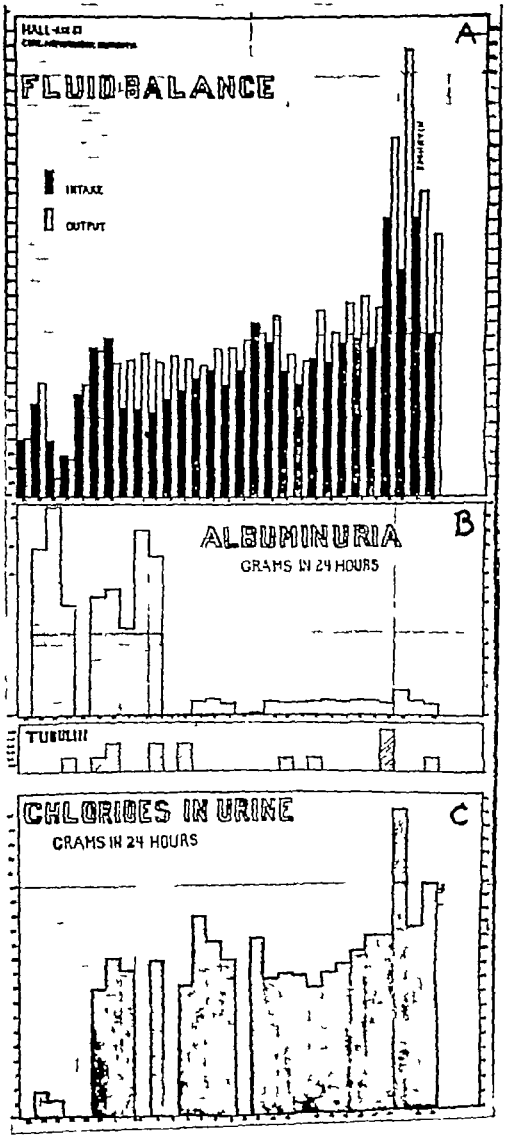

CHART II—Effect of kidney extract (Tubulin) on Intake and Output over thirteen day period as well as on Blood pressure (210/110) before beginning of treatment. During this period, seven c.c. of extract was given as indicated in (A)

(C) Effect of salt and water excretion (aa) One to three gm sodium chloride per day from November 1935 to February 1936, period of interrupted treatment. (a'a') Sodium chloride excretion from March 1936 to March 1937—three to sixteen gm. per day (bb) Urinary output averaged 500 c.c per day during period of interrupted treatment. (b'b') 1000 to 2200 c.c. during period of active treatment.

which even a test of the P S P excretion given with 1000 c c of fluid failed to produce any pretibial edema S M I, who has been taking no treatment for the past nine months, with the exception of two injections given at monthly intervals in the last two months, is consuming approximately eight to ten gm of salt daily, without manifesting any edema

CHART I—Effect of Kidney Extract (Tubulin) on (A) Diuresis (intake and output) (B) Albuminuria total output (gm.) in twenty-four hours (C) Chlorides, as sodium chloride (gm.) in twenty-four hours With maximum diuresis, chloride output was 63 8 gm Use of Eschatin (10 c c.) had only temporary effect on water and sodium chloride excretion.

The diuretic effect of this material is particularly evident in Case 26, which can be seen from Table I, also from Charts I-II An important consideration in connection with the treatment of cases that have lost considerable amounts of salt, is the use of glucose intravenously It has been difficult to escape the impression that the effect of glucose administered intravenously in patients in whom the sodium chloride concentration has been markedly depleted either because of abstention from salt containing substances, because of repeated and copious vomiting, or because of the diuresis set up by the kidney extract, is fraught with considerable danger

In one of the earliest cases treated, (Case 17) the plasma chloride level reached the low figure of 388 mgm per 100 c c although he still excreted one gm of salt a day or less A sister of this patient, similarly treated, also showed a considerable drop of 140 mgm per 100 c c in the plasma chloride calculated as sodium chloride in a curve studied for three hours after the administration of kidney extract Her blood plasma chloride fell to 400 mgm per 100 c c from the normal 550–600 and her salt output in the urine suggested that the tissue depots were sadly depleted She also made a sudden exitus from cardiac arrest, which occurred about one-half hour following the administration of glucose intravenously We have observed this phenomenon in four cases, particularly where a uremic state existed

It has been shown by Sherill that death can be brought about in animals who with even low blood chloride levels can be made to excrete salt through the administration of substances which force diuresis, and we have seen that the diuretic effect of kidney extract manifests itself several days after its administration During the past year we have made it a routine practice to administer a minimum of four to eight gm of salt daily during the administration of the kidney extract We have noticed that where salt deprivation symptoms occur that even the administration of fifteen gm of salt daily for three days does not entirely relieve the symptoms The re-

tensive encephalopathic episodes previous to treatment, one has been free of them for the past eight months after one year of treatment with kidney extract. One case has been under treatment for four years and the blood pressure has fluctuated around 200 to 190 mm Hg, sometimes reaching levels as low as 170 mm systolic and 90 to 110 mm diastolic When treatment is withheld for several months, her systolic pressure goes up to 240 mm and her diastolic to 140 mm One patient under treatment for the past year, who was under continued stress, has reported that since he has been getting these treatments he has felt able to work without the previous fatigue, and his headaches have not troubled him excepting occasionally when he has not been careful with regard to taking the appropriate amount of salt

Effect on Nausea and Vomiting

The effect of this extract on nausea and vomiting which precedes acute uremic attacks, or which constantly accompanies chronic uremia, has been very striking in eight of the cases listed in Table I as well as in the case of W J, reported in connection with the effect of this extract on uremic coma Two cases of nephrosis in adolescents, which are not included in Table I, showed a similar effect. In these eleven cases, nausea, anorexia, and the vomiting present in seven of this group, yielded in a period of from six hours to two days As will be noted in a more detailed description in the cases reported under uremic coma, a noticeable desire for food is manifested, patients expressing themselves as voraciously hungry This was particularly noticeable in Case 8, who reacted to the injection of the extract by developing an appetite which could not be satiated even with a diet of 300 grams of carbohydrate, 125 grams of protein, and 75 grams of fat Vomiting was controlled in all of this group but one (Case 12) The effect on headache was particularly noticeable in cases 8 and 14, and 17 It should be noted, however, that the depletion of the salt reserves of the body is frequently associated with the development of an intractable headache This type of headache, in our experience, fails to respond to any medication, other than the administration of sodium chloride The striking relief from this headache which may be manifest within fifteen minutes to a half hour after the ingestion of five gm of sodium chloride first called our attention to the close relationship existing between this kidney diuretic agent and sodium chloride metabolism It might be well to emphasize here that where excessive depletion has taken place, as mentioned above, it would require many times this amount of sodium chloride to bring about relief

Effect on Hypertensive Retinopathy

One of the most troublesome complications of nephritic hypertension is the retinopathy formerly classified under the term of albuminuric retinitis Previous to the work Page and Heuer the impression was current that this type of change in the retina of the eye was incurable In their report on the treatment of malignant hypertension by section of the anterior nerve roots, they describe a case in whom the eyeground changes had cleared up nine months after operation The report of these three cases is of interest since these changes followed the use of kidney extract. (Cases 3, 15 and 24)

Case 3 was a man, aged fifty-three, manufacturer, suffering from nephritic hypertension for many years, who suddenly found his vision impaired so that he was unable to see clearly or to read letters smaller than the large newspaper headlines Ophthalmoscopic examination showed extensive exudates and hemorrhages in both eyegrounds After four weeks treatment with kidney extract, patient noticed that he was able to read fine newspaper print Ophthalmoscopic examination made about that time showed extensive absorption of the exudates and hemorrhages The ophthalmologist who examined him recently, after four months of treatment reports that the fundus shows less changes today than he observed one year ago

Case 15 is reported in detail under the group treated for uremic coma. When he was definitely out of coma he complained of impairment of vision The ophthalmoscopic examination of the eyegrounds made January 23 showed numerous exudates (cotton-ball type), no recent hemorrhages, blood vessels showed moderately advanced arteriosclerosis, both optic discs blurred. Examination of February 22 showed exudates in

sults up to the present time have been such as to suggest that the treatment with extract must be supplemented by diet and salt to obtain optimum results

Effect on Hypertension

In Table I are summarized twenty-six patients suffering from nephritis in association with hypertension, in whom treatment was instituted Treatment varied from a period of ten days to two weeks in some, to a year or more in others Cases who showed clinical improvement (17) as well as a definite drop in systolic and diastolic pressure are included amongst the cases which are listed as improved Of these seventeen cases, three subsequently discontinued treatment for one reason or another and although they showed clinical and some laboratory improvement sufficient to place them in the category of the improved, while under treatment, have been reported to have died One of these cases is described in detail in the group of uremic coma, controlled by kidney extract He had two attacks of uremia, both associated with marked hypertension, and both yielded to kidney extract treatment The third episode, without kidney extract, resulted fatally The second patient remained well for over a period of fifteen months, following institution of kidney extract treatment and then discontinued it because he felt so well We have not been able to contact this patient to find out his present status The third patient developed a sudden attack of pulmonary edema after being maintained in fairly good health eighteen months after a threatened uremia, although her nitrogen figures in the blood had remained stationary for over four months previous to this sudden attack which terminated her life inside of a half hour

If these cases were to be included in the unimproved group it would leave fourteen out of twenty-six who have shown improvement under this treatment (53 8%) If, however, the three are included it would represent 65 3 per cent Even of those who are listed as unimproved, four showed a temporary improvement Table I shows the effect of treatments, the time treatment was administered and subsequent persistence of the lowered blood pressure or its rise after a period of time indicated in parenthesis The remarkable effect on the diastolic pressure shown in some cases, such as in cases 3 and 7, has not been paralleled in all of the cases listed The majority of these patients who responded to kidney extract showed a much more definite effect on the systolic than on the diastolic pressure

Thus Cases 20, 24, and 25 show a drop of seventy-seven, sixty-four, and fifty mm of mercury, respectively in the systolic pressures, and forty-four, twenty-six, and twenty-five mm Hg, respectively, in the diastolic pressures In Case 15 there was a drop of seventy mm Hg, systolic, and thirty-eight mm Hg, diastolic

In many of these patients there was an immediate drop following the injection of kidney extract, when pressures were taken in fifteen minutes to one or two hours after injection This drop varied from eight to fifty-two mm Hg in some cases, in the systolic, and from two to twenty-eight mm Hg in the diastolic We have usually considered a drop of thirty mm Hg as coming within the range of spontaneous fluctuation

In ambulatory cases, periods required vary from one week to three months to get an appreciable effect In one case it took five months of continuous treatment before the systolic pressure was brought down below the high level of 200 mm Discontinuance of treatment in some cases was followed by continued maintenance of the low level for approximately five months In some cases the pressure went up two months later In Case 3 discontinuance of the treatment for one month, after four months treatment, was followed by an increase of the blood pressure, of approximately forty mm over the previous systolic level and twenty mm over the previous diastolic level, but after eight months subsequent treatment remained low for three months The essential hypertension patients responded either with a comparable drop in the systolic as well as the diastolic blood pressures or they did not respond at all In ten cases of essential hypertension treated, one died whereas the nine who survived—results were good in five, symptomatic relief was present in two, and in two cases which developed hyper-

stantly in mind in the use of this new therapeutic agent The effect on blood chlorides has been reported elsewhere and will not be discussed in the present paper [24]

Case 14, is one of the most striking results which we have observed and illustrates the value of this extract in temporarily prolonging life In her case the study of her urea clearance would have lead us to withhold the treatment because of the futility of attempting to maintain kidney function with a kidney whose function had been so extensively destroyed However, her survival for seventeen months following kidney extract, with creatinine figures that range from three to five during this period and with urea nitrogen figures which fluctuate between forty-three and sixty mgm per cent and a urea clearance fluctuating between 44 and 87 percent, as well as the clinical improvement and the ability to carry on which this patient has manifested, would lead us to believe that this extract therapy should not be withheld even in seemingly hopeless cases

Effect of Kidney Extract on Uremic Coma

The effect of the extract on patients seen either in fully developed or in impending uremic coma is best realized from a detailed report of the following five cases treated

Case 17 was treated with Dr I W Kahn of New York City Age about forty-eight, married, manufacturer of dresses Gives a history of having had hypertension over a long period of time In the past few months his condition has become markedly aggravated He became edematous and developed convulsions occasionally Condition was diagnosed as nephritic hypertension His blood pressure was 240/180, and was in a stuporous condition being roused with difficulty Had edema of the face and extremities His blood chemistry previous to treatment showed urea 136 creatinine 4 6, and plasma chloride 506 He was given three c c of kidney extract following a venesection in which 200 c c of blood was removed and fifty c c of fifty percent glucose injected The glucose and extract treatments were continued at intervals of from two days to a week, following which the patient improved considerably so much so that he was able to recognize his relatives and took part in a discussion of plans for the future, regarding his business, etc. The edema around his eyes and the pretibial edema disappeared and his blood pressure dropped to 180/110 He began to void considerable quantities of urine He was kept on a very low protein, high carbohydrate, salt free diet He was receiving two hot packs in a period of twenty-four hours, one during the day and one in the evening A change of nurses resulted in his being given a cold pack one evening, following which oliguria developed again, edema reappeared, and the patient died with symptoms of uremic convulsions, in spite of the fact that he was given fairly large doses of extract and five percent glucose intravenously (Table II) We did not appreciate the fact that this patient, kept on a salt free diet, developed a hypochloremia with resulting symptoms This effect on his blood and urine chemistry can be seen from Table II While it is true that the urea and creatinine figures rose after the first week, we failed to find in the last eight days preceding death the marked rise in creatinine which usually precedes death from uremic coma It is possible of course to have uremia with even lower urea concentrations in the blood

Case 26, forty-seven years of age, born in Sweden was a superintendent of buildings Family history and past history was negative except for an attack of grip in 1922 following which he developed diabetes Weight was 300 lbs and as a result of dietetic restriction his weight came down to 185 lbs Diabetes controlled by diet He felt well up to two months ago

Two months ago he felt poorly and took a few drinks of whiskey The following morning he was unable to move, felt extremely tired, and suffered from severe pain in the back on both sides This pain continued for a week, getting worse all the time He felt so tired that he was unable to stand He lost his appetite and his wife reported that he had been unable to eat for a week, and was vomiting all the time He felt stuporous, had a marked headache, and his vision seemed blurred He noticed that for three days before he came to the office on December 16 1931 he was passing a very scant amount of urine He attributed this however to the persistent nausea and vomiting which interfered with his eating or drinking anything

Office examination showed a tall man weighing 218 lbs with a marked pallor Face, eyes hands and legs greatly swollen Marked dyspnea Pulse weak but regular Blood pressure 158/98 Marked uremic odor

fundi diminishing, few scattered exudative spots, hemorrhagic areas being absorbed, eyegrounds improved, slight optic atrophy present

The third patient is Case 24, whose clinical history appears in detail under the case histories of uremic coma Shortly after the second admission to St Claire's Hospital, he complained of marked blurring of vision which continued and progressed to the point where he was unable to see clearly surrounding objects or recognize his medical attendant, excepting through the sound of the voice

May 12, 1936 Ophthalmoscopic examination without cycloplegia reveals many fresh and old retinal hemorrhagic areas, very tortuous vessels, areas of retinal atrophy, the result of old hemorrhages, numerous fine and moderately large vitreous opacities, large areas of exudate seen in both fundi, especially in right macular region Externally there is a large amount of chemosis and the edematous conjunctiva are very white Hemorrhages and exudates account for diminished vision Chemosis due to same conditions which have caused edema of face *Opinion* Advanced (severe) nephritis

August 22 Pupils not dilated with medication Round and equal React well to light stimulation, direct and consensual React well on accommodation for distance and near Refracting surfaces clear Retina shows tremendous areas of exudation with large numbers of small hemorrhages of various stages of absorption and age. There are no very recent large hemorrhagic areas The patient states that during the past two weeks there has been a remarkable improvement in his vision The areas of what appeared to be normal retina have a much better color than when last seen

November 20 Vision O D improved from light perception on previous examination to 20/20 with a plus 1 plus 50 axis 90 Improved on left eye from 20/20 to plus 9 plus 50 axis 90 This indicates a tremendous improvement from examination made in July The vision at the present time with a small correction is 20/20 in the right eye and 20/30 in the left This is not due to a refraction error but due entirely to the improvement in the retinal condition There are no new exudates in the retina and those noted at the last examination appear somewhat smaller *a definitely unusual observation* The hemorrhages which were noted at the time of the examination in the hospital have entirely resorbed and there are no hemorrhages noted at the present examination

Effect on Plasma Chlorides and Plasma Proteins

In Cases 3 and 16 there has occurred an increase in plasma protein, explaining in a large measure the disappearance of the edema and its continued absence even after large amounts of salt and water were administered In Case 3 the plasma protein percentage had progressively diminished so that over a period of three years it had gone down far below the edema level, reaching an average figure as low as 3 34 per cent One year after treatment with kidney extract, had attained a level of 6 64 per cent This was not accomplished in a period of three years previous to the administration of the kidney extract, despite the ingestion of considerable amounts of protein—125 to 150 gm per day In Case 16, although protein had not gone down to below the edema level, it showed an increase of over one gram per 100 c c after only ten days of extract treatment Albuminuria is a very variable phenomena in nephritis and it is unsafe to draw any conclusions regarding fluctuations in the daily amount excreted In several patients treated notably Cases 3, 7, 15, 17, and particularly 8, changes occurred in the amount of albumin excreted, following kidney extract administration which seemed to be definitely connected with its use Particularly in Case 8, as can be seen from Chart I the albuminuria dropped from a high level of 14 6 gm per day to less than one gm The suggestion that this drop in albuminuria might represent the development of an acute exacerbation is negatived by the fact that the red blood cell count in the urine is reported as having disappeared even while the albumin excretion was at its height It would be difficult to conceive of an acute exacerbation of an inflammatory process in the kidney without the accompanying presence of an increased number of red blood cells Even the pus corpuscles per HPF which were originally ten to twelve are reported absent while the albumin excreted is still at a level of ten grams per day The most unusual phenomena in this case, however, is the tremendous increase in the amount of salt excreted As can be seen in Chart I, the salt excretion which fluctuated between 5 and 4 6 gm previous to the administration of kidney extract increased to over five times this amount, reaching a figure as high as 63 88 gm in twenty-four hours In a period of three weeks this patient eliminated close to 500 gm of chloride estimated as sodium chloride The effect on the system of such a tremendous loss of sodium and chloride is to be kept con-

emanating from his breath Urine examination showed very heavy sugar content, with albumen two plus and numerous red blood cells No acetone present. His blood chemistry showed a blood sugar of 670 mg percent and a urea of 214 mg percent. No acetone in the blood. He was advised hospitalization but insisted on being treated at home 150 c.c of blood was removed in the office and he was given twenty c c of fifty percent glucose intravenously and forty units of insulin, because it was thought that the condition might be due to his diabetes, despite the absence of acetone He was sent home and put on a diet of two liters of milk daily, and 120 units of insulin, told to keep his room warm He was given a hot pack and high colonic irrigation The results of the blood chemistry examination and the microscopic findings in the urine immediately pointed to the nephritic element as being the main source of his difficulties, but despite this it was decided to concentrate on antidiabetic treatment The following day 175 c c of blood was withdrawn after which the blood pressure came down to 130/70 His blood chemistry on that day showed a blood sugar of 565, urea of 208, and a creatinine of 8 1 The urine still showed heavy sugar, acetone O, albumin two plus, and some RBC and many leukocytes He was given fifteen gr sodium citrate daily, the hot packs and the high colonic irrigations were continued but his general condition remained the same He still felt nauseated all the time and it was difficult to get him to take his milk or fluids The following day his blood chemistry showed a blood sugar of 540, although he was getting 120 units of insulin daily His urea was 306 and his creatinine was 8 3, blood acetone was negative. Urine showed heavy sugar and two plus albumin Intake for the twenty-four hours was 1680 c.c and output was 660 c c His edema still persisted, although following the hot packs and the profuse perspiration it had subsided somewhat He was nauseated and vomited occasionally Headache was constant Refused food. He was in a deep stupor, being aroused with difficulty There was no improvement after three days Insulin and glucose intravenously, repeated venesection and other methods failed to control the vomiting and stupor It was then decided to wait no longer but to administer the kidney extract Accordingly, on December 19, at noon, Dr Rose injected five c.c Six hours later the nurse reported that his condition appeared slightly improved, that he was more conscious of his surroundings, and apparently no longer nauseated, as one hour later the patient complained of hunger His blood pressure dropped following the injection of extract to 126/76 The follow-

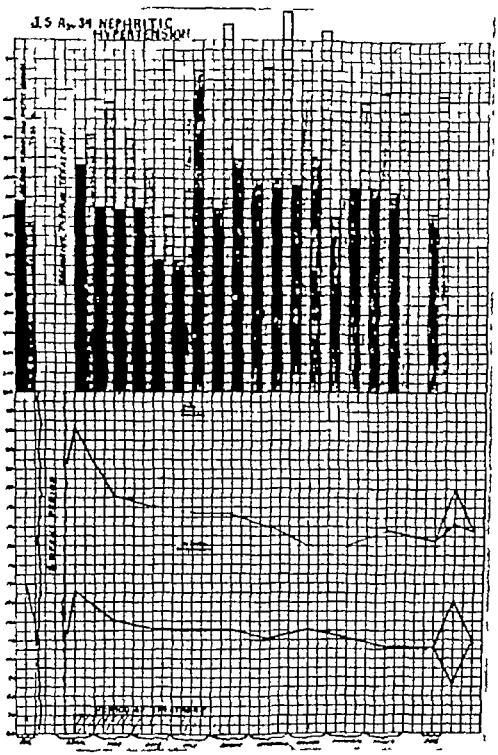

CHART III—Average intake and output over one year period During July, anuria of seventeen hours developed with attack of convulsions and coma of uremic origin. Spinal fluid contained seventy-three mg Urea N Administration of kidney extract (Tubulin) two c c. in fifty c.c normal saline intravenously produced diuresis three hours after injection, consciousness restored six hours after administration

ing day he was given two c.c. of kidney extract and the change in his blood and urine chemistry is evident from Table III (See also Table IV)

CASE 15, age thirty-one, tile worker, was admitted to Jewish Memorial Hospital January 10, 1932, and discharged March 1 *Chief complaint* severe headaches, dimness of vision, drowsiness, and vomiting *Past history* measles and diphtheria. *Present history* for past two years patient has been treated for nephritic condition Since July 31, patient had been partially incapacitated with edema of ankles and entire face On January 7 patient commenced to have spells of headaches, dimness of vision, vomiting, and stuporousness On date of admission had several convulsions and had become mentally unbalanced. Strong acetone and urinous odor to breath.

Physical examination puffiness of eyes, blurred vision, marked carotid pulsations, rales at both bases, heart enlarged to left and right, sounds of poor quality and there is systolic blow transmitted over entire chest, blood pressure 210/130, legs edematous, weight 115 lbs Blood chemistry showed on January 14, urea 98, creatinine 2 1, sugar 96, plasma chlorides 632, carbon dioxide combining power 47 1 percent.

His symptoms continued and patient became more stuporous and finally lapsed into coma Repeated phlebotomy failed to show any change in his condition nor did intravenous glucose help It was then decided to use kidney extract. He was given two c c. on the fourteenth, repeated on the fifteenth, and then again on the seventeenth and eighteenth Within six hours after the first administration the patient became rational and conscious Edema subsided and his urea which was ninety-two on January fourteenth had dropped to sixty on the sixteenth Creatinine of 2 1 had gone down to 1 8 and his carbon dioxide combining power had gone up to 55 7 percent From January 14 to January 24, the patient was treated with kidney extract which produced a definite effect on the concentration of urea in the blood, but its effect on the blood pressure was somewhat inconsistent. We therefore, decided to administer a freshly prepared extract instead of the one being used at this time which was eight months old One-sixth of the amount previously used was given at daily intervals with immediate effect on the blood pressure Systolic pressure dropped to 200, and two and a half hours later it had reached its lowest level, being 100 mm of mercury less than before the fresh extract was used Discontinuing the extract for several days was immediately followed by elevation of blood pressure It again dropped as soon as treatment was resumed Coincident with the rise in blood pressure, was a rise in the nitrogen retention in the blood The patient continued to improve and was discharged two months later

He was readmitted April 23, one month after discharge, from the emergency ward of the hospital, in convulsions Face edematous, tongue coated, pulse rapid and bounding, heart sounds extremely forceful but regular, lungs clear, B P 238/140 Patient gave history of not having taken kidney extract for seventeen days prior *Diagnosis* malignant hypertension and uremia. *Treatment* Hot packs, (2) limitation of fluids, (3) phlebotomy, (4) injection of one c c of kidney extract and insulin units ten, (5) two quarts milk daily and 100 gms of liver or meat. Within a short time patient showed marked improvement, convulsions ceased, edema disappeared blood pressure came down from 238/140 on April 23, to 185/115 on May 2, to 176/120 on May 5 Patient continued treatment at the office for two months and did very well but discontinued treatment because of painful reactions Six months later was admitted to

Morrisania Hospital with similar picture as above, but kidney extract treatment was not used and patient died as a result, in a typical uremic coma

CASE 20, age thirty-three, male, elevator operator, was admitted to St. Claire's Hospital with diagnosis of acute parenchymatous nephritis Patient gave history of having used alcoholic drinks to excess, but does not recall any previous illness other than a Neisserian infection when young No sore throat, scarlet fever or any abnormal habits Present illness began in January 1936 when he developed edema of the legs, together with edema of the eyes and face which was more marked in the morning on arising Was advised rest and given suitable diet, following which he improved considerably February eighth he again developed swelling of his legs and face and was advised hospitalization Was treated at St Claire's Hospital for eleven days and improved under Karell diet and fluid restriction Blood pressure was not greatly elevated at that time, 140/70 on admission and 120/60 after five days Urine on admission showed albumin 2+, specific gravity 1 012, 10-16 R B C per HBF, and finely granular and coarsely granular casts Two months later developed edema of extremities and of face, blood pressure was found elevated, 230/118, suffering from severe headaches and is nauseated Was unable to eat because of nausea Was readmitted to St. Claire's Hospital where he was put under K E treatment Weight previous to admission was 163 and three days after extract was given his weight had gone down to 157 His weight fluctuated during four weeks of hospital stay, reaching as low as 151 lbs His blood pressure taken on admission was 222/136 and came down to 210/116 after 2 5 c c of K.E His blood pressure four weeks later was 172/120 During this time he complained that the vision in the right eye was poor, but his headaches and edema had disappeared Blood urea was 28 5 mgs per 100 c c

He was discharged from the hospital, considerably improved although his vision still troubled him occasionally Walking about during a particularly cold day, although it was in the late spring—he began to develop considerable edema of feet, ankles and legs and pain in the lumbar region with a recurrence of his symptoms His headaches increased in severity, blood pressure was 180/138 He gained eight pounds in one week

He was readmitted on May 24 Weight was 157 lbs and he was placed on the Karell diet with restricted fluids. Under this management his edema, which had affected his face, subsided in part and he felt somewhat more comfortable He still continued somewhat drowsy and listless One week later his face became swollen and on June 3, eleven days after being on Karell diet, he began complaining of headache and vomited his food. His output that day was 180 c c. less than his intake He was again put on kidney extract and his output the following day was 660 c.c. greater than his intake His general condition improved greatly He continued comfortable until one week later when he again developed slight puffiness about the eyes and headache and shortness of breath. The following day edema increased and he was given five grams of salt. He said he felt better with edema of face subsiding He got 1 5 c c K.E on June 13 and two days later developed marked edema of eyes and face despite continued dosage with K.E, with increasing pain in cardiac region and marked edema around the eyes, edema and headaches increasing Blood chemistry on June 13 showed N P N 54 5, Urea N 30 9, Creatinine 1 92, Uric acid 4 49, Plasma Chlorides 567, Cholesterol 178 The following day, with edema increasing his fluid intake was sharply restricted to 400 c.c. and his output fell to 600 c c On July 15 he woke up complaining of pain in cardiac region, with severe headache The following morning he could not be aroused He was in a cold sweat, restless and vomited constantly He was very stuporous and restless at times Had convulsion lasting four minutes Voided thirty c c that night Following day following a venesection he received 300 c c of ten percent saline July 16 spinal fluid-Urea N 73 2, Chlorides 676 2, Sugar 46 Was put in a hot pack and given morphine Convulsions occurred at intervals of ¾ hours Patient was irrational but exceedingly restless and convulsions continued *He was catheterized seventeen hours after last voiding and no urine was obtained* His temperature was 102°, pulse 80, respiration 30 At 7 10 pulse was 120, respiration twenty-six and a spinal tap was done about twenty-one c.c being withdrawn At 9 30 blood pressure was 212/70, had a convulsion at 10 A M, after which blood pressure was 276/130 200 c c of ten percent NaCL given slowly intravenously Same day, at 3 P M eleven gms NaCL in sixty c c distilled water given There was a tremendous increase in edema of eyelids, face, and neck noticed, intravenous was stopped

Patient was comatose, with twitchings and occasional convulsion. During this period systolic blood pressure could not be determined because manometer was not calibrated above 290 Since hypertonic saline and other measures had no effect, it was decided to try *intravenous* administration of kidney extract.

Two c.c of K.E in fifty c c of normal saline was given at 8 15 P M, July 16 This was given intravenously because it was believed that the failure of the previously administered K E was due to absence of absorption because of the extensive edema Patient began to breath stertorously and perspire profusely immediately thereafter Blood pressure dropped to 190/90

Four hours later (12 30 P M) nine oz of urine was obtained by catheter from the bladder Patient semi-comatose and struggling fiercely Edema still present to a marked degree

Six hours after intravenous administration of K.E patient was rational and conscious The following A M patient flooded the bed His blood pressure at 8 30 A M was 180/110 Mental condition markedly improved Taking fluids by mouth T 100°, voided eight oz Given two c.c. K.E in fifty c c. saline the following day On the eighteenth output was 18½ oz Blood pressure 204/124 On July 19 output was thirty-four oz Urinary output increased daily as can be seen from Fig 2, and edema disappeared from face, ankles and scrotum, in about one week 7000 c c withdrawn from abdomen by paracentesis Effect on blood pressure can likewise be seen in Chart II On July 24 output was forty oz Vision is improved, can make out objects indistinctly, and at times recognizes people August 27 up and about for past ten days Marked improvement in vision Marked persistent reduction in blood pressure Slight or no edema of face and extremities Discharged August 28, has taken no treatment for four months Is working regularly as elevator operator, reads annunciator dial and feels well for past nine months Kidney extract once monthly for past five months Appetite good Occasional headache relieved by salt

W J, female, colored age thirty-five was admitted August 5, 1936 to Wickersham Hospital N Y City (Abstract furnished by Dr J Abajian) *Chief complaints* Marked dyspnea and orthopnea Precordial pain, dizzy spells, diminishing vision, twitching, marked weakness, and urinous odor to breath

Past history Essentially negative. No history of acute renal episode or lues Present illness dates back one year ago, when she had a gradual evolution of this present symptomatology, beginning with high blood pressure and dizzy spells Hospitalized six months ago with similar picture to that of her present status She was also at that time semi-stuporous Hospitalized in Italian Medical Center During past few days the twitching and a generalized body itching have been increasing, vomiting consistently

Physical Examination Well-nourished colored female, lying in bed, very restless and twitching, and in a semi-stuporous state, also with a definite visual disturbance Inspection reveals many scratch areas due to intense itching, little to moderate abdominal distension, marked rapid pulsation, marked rapid pulsation of the great vessels of the neck, with much precordial heaving Eyes—pupils in mid-dilation—react to light, and accommodation, equal pupils Fundi reveal some slight arteriovenous compression, pulsation of the vessels, small scattered areas of discrete hemorrhages Definite uremic odor to breath Blood pressure 240/140 Chest reveals markedly enlarged heart to the left anterior axillary line Definite loud systolic blows heard over the whole precordium but loudest over the base Lungs free except for congestive rales of both bases Abdomen reveals moderate distension Liver two fingers below costal margin slightly tender, some suggestion of fluid in abdominal cavity Extremities are negative, slight trace of ankle edema with some sacral edema

Initial laboratory work reveals urine with a fixed specific gravity of 1 010, with 2+ albumin, few granular casts, ten to fifteen R.B C per H P F, volume 800 c c daily output, unlimited intake Blood reveals sugar 100, NPN 210, Creatinine 8 6, Plasma Protein 6 0

Diagnosis Malignant phase of essential hypertension in uremic coma with marked acidosis and probable salt deficit due to persistent vomiting

Treatment was begun with 2000 c.c saline with ten per cent glucose intravenously per day Rapidly and fully digitalized with massive doses However, after five days was apparently not improved, urinary output diminishing sometimes down to 700 c c per day Hypertonic fifty per cent glucose 100 c c per day together with 1-200 c c. of ten per cent sodium chloride intravenously, given next two days with still no apparent change in course At this point K.E. was added to above therapy, one c c intravenously and one c c. subcutaneously daily

After second day there was a definitely noticeable improvement in vision, marked degree of greater orientation Patient began to ask for food However, the convulsive twitching persisted and spinal tap was done, which revealed no increase in pressure At this point the blood pressure was 205/120 The following day there was a still greater orientation with an increase in urinary output up to 900 c c However, on the sixth day after institution of tubulin therapy following the use of 300 c c of ten per cent salt with 100 c c of fifty per cent glucose, patient developed what apparently looked like an acute coronary accident and marked precordial pain, pulse going to pieces both in volume and rate, a marked drop in blood pressure and patient appeared apparently in a state of severe shock, followed by development of pulmonary edema Patient expired within twelve hours

Comment

The clinical use of an agent derived from animal kidney is herewith presented, and its effect on hypertension complicating nephritis reported The fact that this substance is isolated from kidneys shortly after death before autolytic processes can occur and separated by methods which involve very little chemical or thermal injury to the tissue would justify the presumption that this is not a degradation product of nucleo-protein but rather a substance secreted normally by the kidney Its unusual effect on some of the normal physiologic functions of the kidney lend further weight to the presumption The striking clinical changes following its use particularly where kidney function has been partially or completely arrested make this agent an important addition to the therapeutic measures available for the treatment of nephropathies and their complications

Summary

A water soluble extract obtained by acid alcohol extraction of mammalian kidney, freed of proteins, peptones and lipoids, contains a diuretic agent which has been used in the treatment of nephritis and hypertension Cases treated have shown a definite drop in blood pressure in fifty per cent, with definite improvement in the general condition It has markedly increased diuresis and the salt output, with coincident disappearance of edema. In chronic uremia, it has relieved the uncontrollable nausea and vomiting, headache, and dyspnea Three cases of hypertensive retinopathy have regained their sight, exudates in the retina having been absorbed

It has lowered the chlorides of the blood and increased the plasma protein content and diminished albuminuria in several cases It has prolonged life in patients in whom the urea clearance was definitely below five per cent Five patients have been brought out of uremic coma by means of this agent, two of whom are still alive, one five year and the other five months

Discussion

DR. FREDERICK M ALLEN, *New York City*—I was invited to discuss in order to give some of the background of the work, which originated from a different subject I worked for a number of years with experimental diabetes, which could be produced in animals by removal of suitable portions of the pancreas, furthermore,

dietary overstrain was a powerful contributing factor, also diabetes could be brought on by the circulatory disturbance and inflammation excited by temporary clamping of the blood vessels also, as is well-known, portions of pancreas transposed under the skin have been useful for various studies Therefore, as soon as it became possible after the World War, to take up the kidney problem, it was natural for me to try to apply these same methods, and with the aid of about a dozen young American and European doctors an extensive coordinated research was undertaken at Morristown The first summary of results was given in a paper before the American Society for Experimental Pathology in 1922, and was followed by a series of papers during the ensuing eleven years, although important parts of the work were finally left uncompleted and unpublished because of financial collapse Certain of the results of the above-mentioned diabetic methods, as adapted to the kidney, may be mentioned as follows

Partial nephrectomy At the time of our work, the observations of Bradford and other very early writers were practically discredited, and according to the later authors the partial removal of kidney tissue produced essentially two results, up to a certain point it left the animal practically normal, when carried beyond this point it caused rather acute fatality Our work proved that suitable partial nephrectomy can reproduce the most important features of chronic nephritis The animals live for months, showing all the typical urine blood and function changes Since so much of the picture of chronic nephritis represents kidney deficiency, it is logical that this deficiency should be imitated by partial nephrectomy Dr Robert Mark one of the Morristown group, has since continued this line of research in a series of papers in Europe, and has even reported the development of typical retinal lesions as the result of partial nephrectomy in dogs Our results have since been amply corroborated by a series of American writers, very few of whom make any mention of the Morristown work

Diet Our findings with high salt and high protein diets in partially nephrectomized animals have been only partly reproduced by later workers The injurious effect of dietary overstrain can be more readily demonstrated in animals which have been predisposed by partial removal or damage of the kidneys, than in the normal organism and much remains to be done along this line

Explantation of kidney Obviously other organs than the pancreas can be conveniently placed under the skin. The kidney, for example, is thus easily available for chemical tests and the removal of bits for microscopic study We proved that the kidney continues to function efficiently when located under the skin After several years of such work, the explantation of the spleen was described in the paper of Loesch Witts, and Zimmerman (1924) In 1925 I described briefly the explantation of the kidney, which was more extensively illustrated in Loesch's papers in 1927 and 1933 Nevertheless, Rhoads in 1931 published an alleged discovery of this method, and Van Slyke, Paige and collaborators in 1934 continued to refer to "the Rhoads method" of explantation of the kidney

Vascular Obstruction Making use of kidneys transplanted under the skin also of the auscultatory method of blood pressure readings in dogs which I published in 1925, Loesch demonstrated the production of various degrees of sclerosis in the kidneys together with chronic hypertension, by means of repeated clamping of the kidney vessels for ten to thirty minutes This method corresponds to the Volhard-Fahr hypothesis of intermittent vascular spasms in the etiology of this clinical condition Pedersen obtained hypertension by stasis of the renal veins his publication being in the same year (1927) as Loesch's first paper After Loesch's final papers (1933), Goldblatt and collaborators in 1934 announced the production of hypertension by a permanent clamp applied to the renal artery, and in the *A M A Journal* and elsewhere this has been represented as the first discovery of a method for experimental chronic hypertension

The mere closure or narrowing of the main arteries or veins of the kidneys is evidently not responsible for hypertension, because it does not result from total nephrectomy and is only slight or transitory after partial nephrectomy Apparently the kidney substance is concerned in some way Evidently the connection is not nervous, because denervation of the kidneys does not cause hypertension and also according to recent work does not reduce it A chemical or hormonal factor must at least be thought of and it seems inherently plausible that such large and important organs as the kidneys should have some internal secretion

Again following a diabetic procedure namely the Toronto insulin method I proposed to Richard Wagner the making of an acid-alcohol extract of kidneys minced

After second day there was a definitely noticeable improvement in vision, marked degree of greater orientation Patient began to ask for food. However, the convulsive twitching persisted and spinal tap was done, which revealed no increase in pressure At this point the blood pressure was 205/120 The following day there was a still greater orientation with an increase in urinary output up to 900 c c However, on the sixth day after institution of tubulin therapy following the use of 300 c c of ten per cent salt with 100 c c of fifty per cent glucose, patient developed what apparently looked like an acute coronary accident and marked precordial pain, pulse going to pieces both in volume and rate, a marked drop in blood pressure and patient appeared apparently in a state of severe shock, followed by development of pulmonary edema Patient expired within twelve hours

Comment

The clinical use of an agent derived from animal kidney is herewith presented, and its effect on hypertension complicating nephritis reported The fact that this substance is isolated from kidneys shortly after death before autolytic processes can occur and separated by methods which involve very little chemical or thermal injury to the tissue would justify the presumption that this is not a degradation product of nucleo-protein but rather a substance secreted normally by the kidney Its unusual effect on some of the normal physiologic functions of the kidney lend further weight to the presumption The striking clinical changes following its use particularly where kidney function has been partially or completely arrested make this agent an important addition to the therapeutic measures available for the treatment of nephropathies and their complications

Discussion

DR. FREDERICK M ALLEN, *New York City*—I was invited to discuss in order to give some of the background of the work, which originated from a different subject. I worked for a number of years with experimental diabetes, which could be produced in animals by removal of suitable portions of the pancreas, furthermore,

dietary overstrain was a powerful contributing factor, also diabetes could be brought on by the circulatory disturbance and inflammation excited by temporary clamping of the blood vessels also, as is well-known, portions of pancreas transposed under the skin have been useful for various studies Therefore, as soon as it became possible after the World War, to take up the kidney problem, it was natural for me to try to apply these same methods, and with the aid of about a dozen young American and European doctors an extensive coordinated research was undertaken at Morristown The first summary of results was given in a paper before the American Society for Experimental Pathology in 1922, and was followed by a series of papers during the ensuing eleven years, although important parts of the work were finally left uncompleted and unpublished because of financial collapse Certain of the results of the above-mentioned diabetic methods, as adapted to the kidney, may be mentioned as follows

Partial nephrectomy At the time of our work, the observations of Bradford and other very early writers were practically discredited, and according to the later authors the partial removal of kidney tissue produced essentially two results, up to a certain point it left the animal practically normal, when carried beyond this point it caused rather acute fatality Our work proved that suitable partial nephrectomy can reproduce the most important features of chronic nephritis The animals live for months, showing all the typical urine, blood, and function changes Since so much of the picture of chronic nephritis represents kidney deficiency, it is logical that this deficiency should be imitated by partial nephrectomy Dr Robert Mark one of the Morristown group, has since continued this line of research in a series of papers in Europe, and has even reported the development of typical retinal lesions as the result of partial nephrectomy in dogs Our results have since been amply corroborated by a series of American writers, very few of whom make any mention of the Morristown work

Diet Our findings with high salt and high protein diets in partially nephrectomized animals have been only partly reproduced by later workers The injurious effect of dietary overstrain can be more readily demonstrated in animals which have been predisposed by partial removal or damage of the kidneys, than in the normal organism, and much remains to be done along this line

Explantation of kidney Obviously other organs than the pancreas can be conveniently placed under the skin The kidney, for example, is thus easily available for chemical tests and the removal of bits for microscopic study We proved that the kidney continues to function efficiently when located under the skin After several years of such work, the explantation of the spleen was described in the paper of Loesch Witts, and Zimmerman (1924) In 1925 I described briefly the explantation of the kidney, which was more extensively illustrated in Loesch's papers in 1927 and 1933 Nevertheless, Rhoads in 1931 published an alleged discovery of this method, and Van Slyke, Paige and collaborators in 1934 continued to refer to 'the Rhoads method" of explantation of the kidney

Vascular Obstruction Making use of kidneys transplanted under the skin, also of the auscultatory method of blood pressure readings in dogs which I published in 1925, Loesch demonstrated the production of various degrees of sclerosis in the kidneys together with chronic hypertension, by means of repeated clamping of the kidney vessels for ten to thirty minutes This method corresponds to the Volhard-Fahr hypothesis of intermittent vascular spasms in the etiology of this clinical condition Pedersen obtained hypertension by stasis of the renal veins his publication being in the same year (1927) as Loesch's first paper After Loesch's final papers (1933), Goldblatt and collaborators in 1934 announced the production of hypertension by a permanent clamp applied to the renal artery, and in the *A M A Journal* and elsewhere this has been represented as the first discovery of a method for experimental chronic hypertension

The mere closure or narrowing of the main arteries or veins of the kidneys is evidently not responsible for hypertension, because it does not result from total nephrectomy and is only slight or transitory after partial nephrectomy Apparently the kidney substance is concerned in some way Evidently the connection is not nervous, because denervation of the kidneys does not cause hypertension and also, according to recent work does not reduce it A chemical or hormonal factor must at least be thought of and it seems inherently plausible that such large and important organs as the kidneys should have some internal secretion

Again following a diabetic procedure namely the Toronto insulin method I proposed to Richard Wagner the making of an acid-alcohol extract of kidneys minced

absolutely fresh in the slaughterhouse The material which he thus prepared seemed to have some positive effects in both animals and patients, but there were the variations and uncertainties naturally to be expected with a new preparation After the collapse at Morristown, Wagner enlisted the interest of Dr Allan Rowe in Boston, where the work was carried on for some time prior to Dr Rowe's death The investigation has since been carried on by Dr Jablons, first with Wagner and subsequently alone I have had no part in the later work and can make no definite statement about it. Dr Jablons does not necessarily claim that his results are final or that the extract is thoroughly standardized and dependable His reports seem to be encouraging, and in particular, the investigation seems to have a rational basis

I think, therefore, that he should be encouraged to go ahead, and any criticisms should be constructive rather than destructive

MEDICAL GROUP TO AID CHINA'S PEOPLE

Dr Walter B Cannon, physiologist, of Harvard University, and National Chairman of the Medical Bureau to Aid Spanish Democracy, has issued a statement on China which offers help to all American organizations aiding the Chinese. More than a hundred outstanding figures in the medical profession, in every leading medical school in the country, are included in this offer to volunteer their services for the Chinese people

This includes Doctors Haven Emerson, Columbia, Henry E. Sigerist, Johns Hopkins, Frederick Amassa Coller, University of Michigan, Leo Eloesser, Stanford, Roy Wesley Scott, Western Reserve, John P Peters, Yale, Bela Schick, Mt Sinai, New York, Florence R Sabin, Rockefeller Institute and others

Dr Cannon's statement reads

"The Medical Bureau to Aid Spanish Democracy wishes to express its sympathy for the Chinese People and its desire to be of some service to them The pitiable situation of the wounded among the Chinese forces and civilian population, subjected as they are to Japanese bombs, shells and machinegun fire while without adequate medical and surgical services, has aroused the sympathies of many Americans

"Organizations are arising in various parts of the country to encourage efforts to supply medical aid to China In view of the fact that our limited and overworked forces are laboring day and night to render adequate medical aid to Spain, we offer as a concrete expression of our sympathy, to place at the disposal of all individuals and groups who wish to render medical aid to China, the technical facilities we have developed in our past year's experience in helping Loyalist Spain

"To all Friends of China, the Medical Bureau offers the services of the noted medical men who comprise our National Advisory Board It offers the services of our technical staff which has gained experience in establishing eight American hospitals in Spain and in maintaining a staff of 113 doctors, nurses and ambulance drivers

"All this support has been given through liberty-loving Americans who still believe in democracy and abhor Fascism wherever it appears"

AMERICAN DOCTORS VISIT PALESTINE

Recently two American physicians visited Palestine and both received pleasant receptions, we are told in a letter from Palestine to *The Medical Record* Dr Nathan Ratnoff, of New York, came to Palestine to complete the plans for the erection of the building on Mount Scopus which is to bear his name The other was Dr Bela Schick, director of Pediatrics at Mount Sinai Hospital, New York City

Dr Schick found many pupils of his in Palestine who were anxious to hear him speak on subjects in medicine with which his name is intimately associated

In Jerusalem Dr Schick was invited to speak on Allergy and Immunity under the auspices of the Hebrew University, Palestine Medical Association and the Hadessah The lecture was given on August 5 at the Strauss Health Center, the audience consisting of many of his former pupils in Vienna and many medical men of prominence interested to hear the speaker The spacious amphitheatre was filled to capacity and the audience was well repaid for its inconvenience of coming on a hot summer day to listen to lectures on medical topics

RELATIONSHIP OF THYROID DISEASE TO OTOLARYNGOLOGY

H G Bullwinkel, M D, *New York City*

The study of the thyroid gland in its relatively normal, and also its pathological state, has long been of interest to the internist and to the general surgeon Its study should be of equal interest to the otolaryngologist. This can make itself manifest in various ways

From a purely anatomical standpoint, the thyroid gland should be familiar to every laryngologist, as of necessity he may be called upon at any time to perform an immediate and life-saving tracheotomy He should be well-informed of the normal anatomy and of the various types of pathological enlargements of this gland, for any one of these may present itself to the tracheotomist as he progresses downward from the skin to the trachea The relative merits and indications of low and high tracheotomy have been stated by their respective proponents One of the arguments advanced by members of the latter group is that by their favored route, the isthmus is avoided and embarrassing hemorrhage less likely to occur Anatomically, of course, this may be so if the isthmus of a normal thyroid is encountered If a markedly enlarged gland is confronted, knowledge of and experience with the thyroid would tend to make for a rapid and properly performed tracheotomy Certainly, cadaver dissection on the one hand, or better still, assisting at or at least observing thyroidectomies should be experienced at intervals by the competent tracheotomist

Acute thyroiditis is a condition which has been known to clinicians and pathologists since the beginning of the eighteenth century Compared to other glands, the presence of acute inflammation in the thyroid tissue is rare Anatomically, the thyroid gland has a number of pertinent characteristics rendering it resistant to infection It is well-encapsulated by the fascial compartments of the neck, especially by the fusion of the superficial layers and the pretracheal layer of the deep fascia These fascial planes protect the gland from infection in the contiguous structures by restricting bacterial invasion Then, too, the large number of overlying muscles adequately protect the gland from external violence The gland has no direct communication with the pharynx except in those cases where there is a persistence of the thyroglossal duct leading to the foramen cecum There is an adequate and profuse blood supply, both arterial and venous, and an unusual lymphatic arrangement of capillaries within the gland which allows a freedom of lymph drainage unequalled in any other parenchymatous organ Some authorities have also stated that the thyroid secretion itself has a mild bacteriocidal function The means by which infection may ener this gland are

1 Direct trauma or puncture wounds through the skin
2 Direct extension from the contiguous structures of the neck
3 Extension through a persistent thyroglossal duct
4 Lymphatic metastases
5 Blood stream metastases

The onset of symptoms in acute thyroiditis should be easy to recognize They consist of pain, fever, and chills, together with sudden enlargement of the gland The pain is aggravated by motions of the neck as the complex fascial planes tightly bind the inflamed gland, so the patient may assume an attitude with head bowed and held firmly between the hands, elbows resting on the knees If one side of the gland only is affected, it may even cause the pulling of the head to one side by pressure on the muscles Local tenderness is a constant sign and may be exquisite The swelling may, from pressure, cause hoarseness or even aphonia and may interfere so severely with respiration that a tracheotomy may be required Deglutition may also be interfered with through pressure on the esophagus Symptoms of hyperthyroidism usually occur with the acute inflammation, but subsequently subside, al-

though hypothyroidism may follow some months later, due possibly to glandular destruction This condition may also follow surgical procedures in the nose and throat—particularly tonsillectomy It has been known to follow both the surgical enucleation and electrocoagulation of the tonsils [1]

In order to understand this subject more fully, it is necessary to state the various clinical classifications of goiter Three large groups immediately come to mind, namely (1) adolescent hyperthyroidism, (2) hyperthyroidism of Graves' disease, and (3) hyperthyroidism of adenoma of the thyroid gland

In the first group, we have a rather vague, illusive terminology and pathology The condition is found in growing children, usually girls, and is physiologic in character Its mechanism is probably dependent upon an increasing demand for the production of thyroxin Patients in this group usually have chronic nasopharyngeal infection There may be a slight hyperplasia of the thyroid gland with an increase in the number of columnar cells lining the acini and with a decrease in the colloid In this group removal of the tonsils, treating sinus disease, and attacking dental infection is usually followed by improvement

In the second group, there is a proliferation of the columnar acinar cells, development of new acini, and also a loss of colloid material Here we apparently have a stimulation of the individual cells of the thyroid to produce rapidly large amounts of thyroxin In this group, iodine medication should be given for a week or ten days before any nasopharyngeal operation In Graves' disease we must note an interesting feature, namely, the fact that its course is represented in cycles and if nose and throat surgery is to be considered, unless urgent, it should be attempted only during a quiescent phase

In the third group we have a type of hyperthyroidism entirely different from that in Graves' disease There is a more chronic process with a growth of adenomatous tissue apparently occurring within a normal thyroid gland In the first and second group, sinus surgery must be considered only after careful study of the patient and in close cooperation with an internist well-versed in the peculiarities of thyroid disease In this third group we should note that the disease characteristically occurs in the late third and fourth decade in apparently well-nourished individuals whose typical history is that of tachycardia, palpitation or heart disease

From the preceding it is obvious that a thorough understanding of the types of thyroid disease must be had by the otolaryngologist before attempting operations in this field It is interesting to note that many authorities on the thyroid omit, or only lightly dwell upon, the relationship existing between thyroid disease and otolaryngological conditions which the writer has noted However, many laryngologists are now taking due cognizance of this affinity Dr Dunbar Roy of Atlanta, Ga, in a paper read before the medical association at Savannah, Ga, (April 22, 1936) states that "there is a close relationship between the thyroid gland and the lymphoid tissue of the throat," and even suggests that patients should be iodized before and after tonsillectomy This, of course, is true only if the individual patient comes under the group of thyroid disease for which iodine medication is indicated

The writer in his own paper,[1] particularly has brought out the importance of the tonsils and even the sinuses in this study Further observation has been convincing that the various parts of Waldeyer's ring are of equal import This was brought to light most vividly in a recent case of septal deviation In this case a complete tonsillectomy had been performed some years before The patient complained of a marked obstruction to breathing in the right naris, and examination of the nose revealed a badly deviated septum to the right Accordingly, a submucous resection was done The patient convalesced uneventfully until the sixth day when she complained of a slight sore throat, and upon examination it was seen that she had a follicular infection of the islands of lymph tissue in the postpharyngeal wall and in the pharyngeal tonsils, most marked on the right side This subsided under local treatment in a few days When seen a week later this patient had a mild enlargement of the right lobe of the thyroid and all the clinical signs and symptoms of a mild hyperthyroidism This subsided in a few weeks with rest and sedation

There therefore naturally arises the question as to the cause of this association It has been suggested that infection may be transmitted from the pharynx by

way of the vascular and lymphatic channels to the thyroid It may also well be that the function of the thyroid is disturbed by way of the sympathetic nervous system as, in the surgical removal of tonsils, branches of the glossopharyngeus nerve and of the sphenopalatine ganglion are cut as they enter the tonsils along their attached sides Then too, as these patients have a low psychic threshold, it may be that the shock of acute infection or of operation is sufficient to precipitate some form of thyroid dysfunction

One other rather unusual condition seen by the laryngologist is the lingual thyroid This type of thyroid tissue may be an accessory gland or, as not infrequently happens, it may be the only thyroid tissue present in the entire organism When diagnosed, the question of its excision, of course, comes to mind This, as an almost universal rule, should not be done, for after its extirpation it is most likely that myxedema of a marked degree will follow Fetterolf[2] reports one such case and quotes Lanzi, who states that myxedema occurred in twenty-two per cent of these cases when operated upon Mayo[3] reports three such cases and Smyth[4] reports one The last named author refers to Seldowitsch, Kraske, and also to Lanzi, all of whom agree that exhaustive study must be made in order to ascertain, if possible, if there is any normal thyroid tissue present Ashurst[5] reports a very interesting case of carcinoma of this accessory thyroid

Another aspect of importance to the laryngologist in connection with thyroid disease and its surgery, is the question of hoarseness It may seem superfluous, but emphasis must again be made upon the close relationship which should exist between the laryngologist and the thyroid surgeon A thorough examination of the larynx should be made prior to thyroidectomy and specific notes made as to the condition and motility of each vocal cord Superficial and slipshod inspection of the voice box is insufficient The larynx should be properly cocainized before indirect laryngoscopy and if the cords cannot be seen in their entirety the laryngoscopist should not commit himself until direct inspection of the larynx has been made with a laryngoscope Immediately following the operation, or as soon as the patient has thoroughly recovered from the anesthesia, the laryngoscopist should have the privilege of interviewing the patient in order to note any change in the timber of the patient's voice Before discharge from the hospital he should again be examined laryngoscopically, indirectly or directly If the surgeon performing thyroid operations were to have all his cases examined by a competent laryngologist, he would many times be astonished to learn that a paralysis of one cord existed and with no larynx symptoms Stein[6] reports a case of a young lady with an absolutely normal larynx just before a goiter operation Immediately after the operation he observed a completely paralyzed cord on one side, resulting in almost complete aphonia for five days On the sixth day the voice began to return although the cord remained in the totally paralyzed condition and remained so for four months. All this time the patient had a good voice, affected only in its higher register After four months the cord very gradually began to show motion, although no medical treatment was employed, merely vocal exercises, and the cord is now improving steadily in its various excursions In this case the recurrent nerve was not injured by the knife but the paralysis was due to pressure caused by the inflammatory effusion This most certainly proves that a post-operative examination must be made for one cannot tell whether or not there is a paralysis present as the voice as well as the breathing may be unimpaired even with one vocal cord completely paralyzed It is interesting to note in this connection that Hubert[7] reported a case of bilateral laryngeal paralysis due to a substernal thyroid

All of the previously described conditions have to do in general, with the manifestations of an overactive thyroid gland It is now in order to discuss the converse namely hypothyroidism, as seen by the rhinologist Examples of this are seen in cases of nasal polyposis. These, of course, may occur as pure myxomata, though they are as a rule fibromyxomata. Some occur in the presence of acute infection in the nose and sinuses and others concurrently with hay-fever and other allied allergic conditions It has been

stated on occasion that if metabolism tests were taken in this latter group, a considerable degree of suboxidation, probably due to a sluggish functioning of the thyroid, would be found Foster[8] states, "that the myxoedematous state involves the mucous membrane producing conjunctivitis, marked swelling of the membranes of the nose and mouth, even of the larynx, so that the voice is weak" It is obvious that patients with this type of nasal mucosa are prone to develop nasal polypi, given the added factor of infection These cases might be markedly benefited by proper doses of thyroid extract

It is certainly evident from the foreg ing that a thorough understanding of tl thyroid gland in all its phases is mo essential to the mental armamentarium the competent laryngologist

PAN AMERICAN MEDICAL CRUISE

More than 600 American physicians and surgeons will join the seventh cruise-congress sponsored by the Pan-American Medical Association, a seventeen-day trip to Cuba and the West Indies beginning on January 15

The association, founded eleven years ago to promote the interchange of medical knowledge and experience among countries of the Western Hemisphere, held its last similar trip in June 1935, when 300 doctors from all parts of the United States visited Brazil Papers prepared by research workers and practitioners are read at sessions held on shipboard and the doctors confer with their Pan-American colleagues and examine medical facilities during stop-overs

Delegates for this year's cruise, who will sail from New York on the Furness Bermuda liner *Queen of Bermuda*, will visit Havana, Port au Prince, Haiti, Trujill City, Dominican Republic, and San Juar Puerto Rico The doctors, many of whor will be accompanied by their wives, wi pass five days in Havana, where 700 addi tional physicians representing twenty-on Central and South American countries ar expected to join them in sessions and clinics

Dr Joseph Jordan Eller, director genera of the association, announced that plans fo the proposed $7,000,000 Pan American Post Graduate Medical School and Hospital i New York had been altered so that the as sociation is now negotiating to purchas an unnamed hospital now operating in th city He said the directors had decide that the association's funds might be bette spent for equipment and provision fo scholarships, rather than "for bricks an mortar to construct a new building"

RAPID FIRE REMEDY COMING FOR GONORRHEA

Medical research may yield within a few months a new treatment for gonorrhea which will take only a week, compared with the treatment period of from three to six months required at present, Dr Walter Clarke, executive director of the American Social Hygiene Association, said at a conference of social hygiene executives, held under the auspices of the American Social Hygiene Association, at the International Building, Rockefeller Center

Sulfanilamide preparations being developed, he said, will then face the question of general practicability before it can be said that a major step has been taken toward the control of venereal diseases Fever therapy, he said, is not applicable generally, being too costly The question in the case of the chemical compounds will be whether or not they are too toxic to be of use to the medical science

New York City is "well along the road in the treatment of syphilis," said Dr Clarke, who is a consultant to the Department of Health, "but it is just getting to the problem of gonorrhea" The studies now being made will be conclusive when they are finished, he said, and when they are done, "we can say whether or not they are too dangerous for general use"

The conference was held to plan a national campaign against social disease and for the second National Social Hygiene Day, February 2

VILLOUS TUMOR OF RECTUM

W F PREUSSER, M D, *Albany*

Villous tumor of the rectum is an uncommon lesion Quenu and Landel[1] in 1899 first stimulated the interest of the clinician in this disease by reason of a complete clinical report of four cases and the careful histologic examination of tissue derived from them

It is essentially a disease of adult life Bensaude et al[2] reported in 1930 a detailed analysis of fifty nine cases gleaned from the literature The age incidence was as follows

Before 40	3
40–50	15
50–60	13
60–70	17
After 70	11

The sex incidence was about equal

The size of the tumor depends of course on the length of time it has been present It may be large enough to almost entirely occlude the lumen of the rectum

The histologic structure shows single or multiple layers of cylindrical cells (in papilliform arrangement) supported by delicate vascular adenoid tissue There is a pronounced tendency toward recurrence and malignant change[8]

The symptomatology is entirely referable to the rectum There may be constipation alternating with a pseudodiarrhea and considerable rectal tenesmus A gelatinous or glairy mucoid (egg-white) discharge is an outstanding symptom Occasionally hemorrhage occurs and there may be prolapse of the tumor or fragmentary expulsion of the mass Bensaude reports a case in which 106 fragments were expelled over a nine months' interval

On palpation the growth is soft, spongy, and exceedingly smooth The finger dips down between the individual lobes The tumor lacks the solid structure of adenoma and the induration of base and margin as in carcinoma It has a grayish pink, glistening appearance on inspection Histologic tissue examination differentiates it from other benign or malignant tumors

Thorough extirpation of the tumor is indicated because of its tendency to malignant degeneration This may be accomplished by excision or electrocoagulation The method employed depends upon its extension superiorly (accessibility), surface area involved, the presence of malignant change, and the age and general condition of the patient Deep x-ray therapy and radium have proven to be entirely inadequate in the experience of Bensaude The prognosis is good if the tumor has been thoroughly extirpated before the onset of malignant change

Case Report

A white female, fifty-one years of age, school teacher, had no familial history of rectal or colonic disease Bowel elimination until the onset of present disease was normal

Present history The patient was first seen on Sept. 30, 1935 In July 1934 she first noted a difference in the character of the bowel movements They became more frequent and were accompanied by a rather profuse mucoid discharge No blood or pus was seen In June 1935, protrusion of a mass was noted following a bowel movement. This was replaced manually each time by the patient and was interpreted as a pile This was the condition which prompted her to seek relief Her general health did not seem to be greatly impaired

Except for the rectal lesion, general physical examination was essentially negative The blood pressure was 120/80

Proctologic examination showed a cutaneous tab at the anterior anal commissure Introduction of the gloved finger reveals a sphincter of normal tone Occupying the lumen of the rectum, soft, spongy, lobulated masses of tissue may be felt. These masses arise from the mucosa and have a smooth, velvety surface They are situated on the anterior, posterior, and right lateral surfaces of the rectal ampulla, extending superiorly for a distance of about four inches from the dentate line At the lowermost pole of the posterior mass is a definitely polypoid formation which by manipulation with the fingers can be extruded from the anus It is about three cm in diameter and has a smooth, pinkish, mucosa-covered surface.

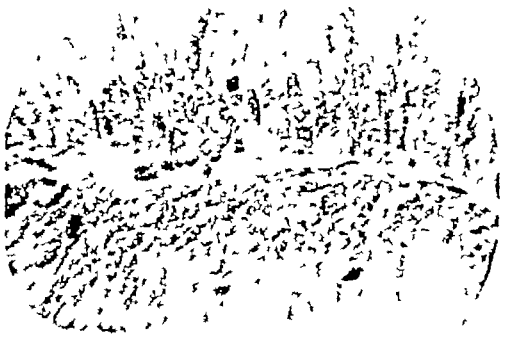

Fig 1 Villous papillae and occasional acinous formation Note absence of invasion at base

Proctosigmoidoscopic examination for a distance of ten inches shows only the lower four inches of the rectum to be involved There is an abundance of thick, glairy, mucoid secretion There are no ulcerations of the tumor surface The grayish-pink masses are in the form of ridges, having an S-like configuration, their summits being about one-half inch above the level of the surrounding mucosa The posterior lobule extends furthest inferiorly terminating in a well-defined polypoid tumor about one-quarter inch above the dentate line This is the prolapsing portion (subsequently excised) The anterior ridge extends furthest superiorly with a distinct knob formation at its upper pole The superior surface of the lowermost valve of Houston has on it a small mass of tumor tissue (seen with a dental mirror) Biopsy from the edge of the main tumor mass was done

Laboratory findings Blood Wassermann negative No entamoeba histolytica or other intestinal parasites were found R B C 4,500,000, W B C 7800 Urine negative

Tissue report The sections for microscopic study are stained with hemotoxylin and eosin Most of the tissue consists of slender papillae and villous-like processes covered in a very orderly manner by tall columnar epithelium The epithelial cells are sharply limited by a basement membrane from the underlying connective tissue which forms a thin core in each papilla Long ovoid hyperchromatic nuclei are situated near the base of the columnar cells The cytoplasm toward the other extremity of the cells contains lightly stained vacuoles suggesting mucus as observed in "goblet cells" A few of the nuclei are undergoing mitosis The tissue segment includes a portion of the muscle coat of the rectum At this point there is no demonstrable invasion A diagnosis of villous papilloma of the rectum was made by Dr John J Clemmer, Director of the Bender Hygienic Laboratory, Albany

Treatment Two possible procedures were considered in planning treatment for this patient It was extensive enough to warrant complete excision of the rectum, a suggestion rejected by the patient Coagulation of the tumor was then decided upon together with the simultaneous employment of deep x-ray therapy The coagulation was effected through a six inch illuminated proctoscope constructed of bakelite which is a non-conducting material The interchangeable tip coagulating instrument employed has been previously described The first coagulation was done on Oct 5, 1935, and at weekly intervals thereafter for a period of two months The coagulated areas promptly sloughed away leaving a grayish membrane adherent to the base Upon exfoliation of this membrane, a raw, granular oozing surface presented which gradually became epithelialized Coagulation of the deeper layers of the rectal wall was particularly avoided to prevent the development of any considerable amount of scar tissue with contracture of the lumen of the gut

The anterior and posterior perineal zones were irradiated alternately at weekly intervals over a period of four weeks A full erythema dose was given in each instance There was considerable malaise and nausea following these exposures A second tissue examination performed two weeks after

Fig 2 Slender villous papilla covered by tall columnar mucous epithelium. Note three mitroses X560

the last x-ray treatment showed no change in the histologic appearance of the tumor The proportion of mitotic figures present and the general appearance of the individual cells gave the impression that the tumor was not particularly influenced by radiation. It was discontinued

Clinical course On Feb 21, 1936, the rectum was seen to be free from tumor tissue. The rectal wall was entirely epithelialized and seemed to be soft and pliable There was no appreciable diminution in the caliber of the lumen except in the region of the lower Houston valve which was somewhat stiffened. It was planned to inspect the interior of the rectum at intervals for possible recurrences

The following June, the patient experienced an attack of acute abdominal pain referable to the lower left quadrant. There was an obstinate constipation present. Sigmoidoscopic examination was negative An x-ray with a barium enema revealed an occlusion of the lumen of the bowel at the level of the descending colon It was felt that a pelvic mass was present and accordingly on July 6 a laparotomy was performed elsewhere A twisted gangrenous and ruptured, left ovarian cyst firmly adherent to the descending colon was found The pathological diagnosis of the specimen removed at this operation was cyst-adenocarcinoma of the ovary The postoperative course was stormy and on July 31, the patient expired. No postmortem examination was obtained

Comment

Villous tumor is an unusual type of rectal growth Electrocoagulation is an effective therapeutic agent in its removal The inability to obtain a postmortem examination in the above cited case precludes the possibility of establishing the relationship, if any, between the primary rectal tumor and the complicating ovarian disease

TO BAR MORE ELIXIR TRAGEDIES

Drastic strengthening of the Food and Drug Act to prevent recurrence of such a tragedy as the recent deaths of seventy-three persons from 'elixir sulfanilamide" is recommended to Congress by Secretary of Agriculture Wallace.

Secretary Wallace said citations already were being prepared calling on the manufacturer, the S E Massengill Co of Bristol Tenn, to show cause why its officers should not be prosecuted criminally in the Federal courts

The report of the Department of Agriculture was in reply to a request in Senate and House resolutions for information concerning the 'elixir" deaths

The present law was declared to be inadequate to protect purchasers from such medicines The only basis on which action could be taken against the Massengill concern, it was said was the contention that the word elixir implies an alcoholic content, whereas the product was a diethylene glycol solution" The report added

The fact that the law contains no specific definition of elixir' may be responsible for Dr Massengill's statement in his letter to the American Medical Association I have violated no law'"

To protect the public from dangerous drugs Secretary Wallace recommended a license control of new drugs to insure they will not be generally distributed until experimental and clinical tests have shown them to be safe for use

He pointed out that physicians druggists even plumbers were licensed but there is no such control to prevent incompetent drug manufacturers from marketing any kind of lethal potion."

Proposed legislation would prohibit marketing of drugs dangerous to health when administered in accordance with the manufacturer's directions Druggists would be required to affix labels bearing adequate directions and warnings against probable misuse

Secret remedies would be banned entirely Chemical manufacturers would be required to disclose on labels the exact composition of each drug The report added

Many poisoning cases result from choice of the wrong bottle from the home medicine cabinet or from bottles left within the reach of small children In such cases attending physicians are able to proceed intelligently and administer the proper antidotes or other treatment only if labels carry full disclosure of composition Delays in obtaining this information by communicating with the manufacturer may often mean the difference between life and death'

Laboratory findings Blood Wassermann negative No entamoeba histolytica or other intestinal parasites were found R B C 4,500,000, W B C 7800, Urine negative

Tissue report The sections for microscopic study are stained with hemotoxylin and eosin Most of the tissue consists of slender papillae and villous-like processes covered in a very orderly manner by tall columnar epithelium The epithelial cells are sharply limited by a basement membrane from the underlying connective tissue which forms a thin core in each papilla Long ovoid hyperchromatic nuclei are situated near the base of the columnar cells The cytoplasm toward the other extremity of the cells contains lightly stained vacuoles suggesting mucus as observed in "goblet cells" A few of the nuclei are undergoing mitosis The tissue segment includes a portion of the muscle coat of the rectum At this point there is no demonstrable invasion A diagnosis of villous papilloma of the rectum was made by Dr John J Clemmer, Director of the Bender Hygienic Laboratory, Albany

Treatment Two possible procedures were considered in planning treatment for this patient It was extensive enough to warrant complete excision of the rectum, a suggestion rejected by the patient Coagulation of the tumor was then decided upon together with the simultaneous employment of deep x-ray therapy The coagulation was effected through a six inch illuminated proctoscope constructed of bakelite which is a non-conducting material The interchangeable tip coagulating instrument employed has been previously described The first coagulation was done on Oct. 5, 1935, and at weekly intervals thereafter for a period of two months The coagulated areas promptly sloughed away leaving a grayish membrane adherent to the base. Upon extoliation of this membrane, a raw, granular oozing surface presented which gradually became epithelialized Coagulation of the deeper layers of the rectal wall was particularly avoided to prevent the development of any considerable amount of scar tissue with contracture of the lumen of the gut

The anterior and posterior perineal zones were irradiated alternately at weekly intervals over a period of four weeks A full erythema dose was given in each instance There was considerable malaise and nausea following these exposures A second tissue examinat on performed two weeks after

Fig 2 Slender villous papilla covered by tall columnar mucous epithelium. Note three mitroses X560

the last x-ray treatment showed no change in the histologic appearance of the tumor. The proportion of mitotic figures present and the general appearance of the individual cells gave the impression that the tumor was not particularly influenced by radiation. It was discontinued.

Third course: On Feb. 21, 1936, the rectum was seen to be free from tumor tissue. The rectal wall was entirely epithelialized and seemed to be soft and pliable. There was no appreciable diminution in the number of the lumen except in the region of the lower Houston valve which was somewhat stiffened. It was planned to inspect the interior of the rectum at intervals for possible recurrences.

The following June, the patient experienced an attack of acute abdominal pain referable to the lower left quadrant. There was an extensive constipation present. Sigmoidoscopic examination was negative. An x-ray with a barium enema revealed an obstruction of the lumen of the bowel at the level of the descending colon. It was felt that a pelvic mass was present and accordingly on July 6 a laparotomy was performed. This revealed a twisted gangrenous and ruptured left ovarian cyst firmly adherent to the descending colon, which was found. The gross pathologic diagnosis of the specimen removed at this operation was cystadenocarcinoma of the ovary. The postoperative course was stormy and on July 31 the patient expired. No postmortem examination was permitted.

Comment

Villous tumor is an unusual type of rectal growth. Electrocoagulation is an effective therapeutic agent in its removal. The inability to obtain a postmortem examination in the above cited case precludes the possibility of establishing the relationship, if any, between the primary rectal tumor and the complicating ovarian disease.

TO BAR MORE "ELIXIR" TRAGEDIES

Drastic strengthening of the Food and Drug Act to prevent recurrence of such a tragedy as the recent deaths of seventy-three persons from "elixir sulfanilamide" is recommended to Congress by Secretary of Agriculture Wallace.

Secretary Wallace said citations already were being prepared calling on the manufacturer, the S. E. Massengill Co. of Bristol, Tenn., to show cause why its officers should not be prosecuted criminally in the Federal courts.

The report of the Department of Agriculture was in reply to a request in Senate and House resolutions for information concerning the "elixir" deaths.

The present law was declared to be inadequate to protect purchasers from such medicines. The only basis on which action could be taken against the Massengill concern, it was said, was the contention that the word elixir "implies an alcoholic content, whereas the product was a diethylene glycol solution." The report added:

"The fact that the law contains no specific definition of elixir may be responsible for Dr. Massengill's statement in his letter to the American Medical Association: 'I have violated no law.'"

To protect the public from dangerous drugs, Secretary Wallace recommended a close control of new drugs to insure that they will not be generally distributed until experimental and clinical tests have shown them to be safe for use.

He pointed out that physicians, druggists and even plumbers were licensed, but "there is no such control to prevent incompetent drug manufacturers from marketing any kind of a mixture."

Proposed legislation would prohibit marketing of drugs dangerous to health when administered in accordance with the manufacturer's directions. Druggists would be required to affix labels bearing adequate directions and warnings against probable misuse.

Secret remedies would be banned entirely. Chemical manufacturers would be required to disclose on labels the active composition of each drug. The report added:

"Many of the drug cases result from use of the wrong bottle from the home medicine cabinet or from bottles left with the effects of small children. In such cases offending proprietors are able to proceed immediately and administer the proper antidotes or other treatment only if labels carry full disclosure of composition. Delays in securing this information by communicating with the manufacturer may often mean the difference between life and death."

Preventive Medicine

Prevention of Obesity and Diabetes

Including Consideration of Their Relation

CHARLES H GOODRICH, M D, *Brooklyn*

Presidential Address

There is outstanding necessity for physicians to impress upon their people the influence of nutrition to faulty structure and to destruction of indispensable functions of the human body When we consider the prevention of obesity we are primarily thinking of structure. In diabetes we have reduction of an essential function (oxidation and utilization of glucose resulting from digestion of carbohydrates) to lower or lowest terms Moreover obesity is undoubtedly the most important cause of diabetes Endocrine imbalance and other complex inter-relations loom as probably important factors There exists between these conditions a complex biochemical relationship of which all people should be conscious The detailed comprehension of this must be left to the scientific minds in the world of laymen and to physicians Physicians must transmit the principles, the essential truths to their patients The details would confuse and becloud required understanding

Obesity, or the excessive storage of fats, is very common and a disease worthy of consideration and prevention If companioned by other diseases or conditions demanding major surgery its importance increases and its degree swells its importance in increasing ratios Obesity should be prevented because of frequent association with other diseases and because it can lessen human efficiency and shorten life

"The fundamental cause of obesity is a positive energy balance" (Means) This shows that more food values are absorbed than are expended in producing energy and in the manufacture of heat. Ingesting daily a little more fuel (food) than is used, over a period of years, can produce a large amount of fat. Gourmands may increase their fat in storage rapidly and constantly for a long time Overeating may grow to be a habit especially in the formative years of life Indeed it is now seen that it is a mistake to urge children and adolescents to overeat, as they grow without careful observations of weight and proportionate growth of diameters and lengths This eager generous provision by many parents has caused many cases of habitual overeating resulting in handicaps or other diseases and in abbreviations of lives This type of eating habit well-developed in the third and fourth decades is almost as difficult to relinquish as are alcohol and tobacco

When people keep a constant weight within normal limits they are eating about what they need—often without conscious efforts at increasing or reducing intake This may be called normal matching of appetite to need When the enjoyment of eating occupies an abnormal degree of attention, eating too much becomes a habit and lo! obesity The same result comes when we are too busy to think about what we are eating and devour increased rations with haste Horace Fletcher who held that if Gladstone's rule of chewing each mouthful thirty-two times was good it would still be better to chew until the food became the consistency of milk—all the while mentally dwelling on the taste—and rejecting masses that could not be so reduced Fletcher was an obese millionaire lumberman condemned to nephritic death at fifty He developed his theory in an effort to cure himself and help others, went about it scientifically by paying outstanding physiologists huge honorariums for experimenting upon him and others elaborately, and incidentally survived until well along in the eighties He was obese at the time of his condemnation and his excessive chewing practice proved to be one of the soundest methods of reducing weight. Not only does the overeater grow tired of excessive chewing but the stomach has time to send

Read at the Annual Meeting of the Eighth District Branch, Olean, October 7, 1937

the message "enough" to the center of appetite control before half of the old huge meal is taken This method requires no ruling out of favorite foods Fletcher reduced his proteids to lowest terms but never proved this case by the physiologists Per contra, we now find experts in nutrition urging larger proportion of proteid intake carefully checked by physical ability to utilize and excretory ability to cast off their waste products This is a passive and fractional method of resisting or reducing obesity

It is true that we have two types of obesity—the *exogenous* caused by eating more than body-functions demand and *endogenous* (in five to eight per cent of cases) due to disturbances of the actions of internal glands There are several ways in which endocrine disturbances may operate, some very complicated and not thoroughly understood The excessive obesity of children and youths is usually due to insufficiency of the posterior lobe of the pituitary Hypothyroidism causes obesity in some cases, usually with other symptoms well-known to physicians Estimation of the metabolic rate furnishes accurate audit of these cases, and feedings with thyroid extract carefully observed, corrects the condition—but may be needed over periods of years

It becomes clear, therefore, that every case of obesity is a cause for consulting the physician, the determination of cause, and treatment by regulated diet adjusted according to weekly weighing and other observations, or by needed glandular treatment. This careful studious attention is as necessary as is the treatment of any other abnormal conditions, many of which, from their more sudden onset and greater discomforts seem more important. This attention may seem tedious and expensive to the patient, but is very important! It may not offer a fascinating field of scientific endeavor to the physician but when we consider the varieties and degrees of potential harm in obesity it is thoroughly worth-while duty done

Obesity makes the heart overwork to pump more blood through more tissues and wears out the elasticity of the arteries prematurely, especially, as is often the case, when the individual overworks physically and mentally Fat people make poor subjects for treatment of any acute infectious disease This is particularly true of pneumonia They also make poorer surgical risks Besides diabetes mellitus, obesity causes cardiovascular disease Insurance companies recognize all of these facts in selecting and grading their patrons

The prevention of diabetes, especially in mature adult life, can often be secured by avoiding obesity Hereditary influences are often recognized, particularly in children, although it is probable that a considerable proportion of seeming inheritances are really family habits of diet (too much sugar, starch, and (or) fat) It is therefore important that families should study diets with their physicians to prevent diabetes This is especially necessary if obesity or diabetes is common in progenitors

The type of overeating most closely related to the cause of diabetes is the consumption of sugar The steady increase in the occurrence of diabetes and its death rate seem to prove this, although the increase of death rate is proportionately slower because of improved treatment The per capita consumption of sugar in the United States was sixteen pounds in 1816, fifty-six pounds in 1900, eighty-two pounds in 1920, and in 1930 approximately a hundred pounds From 1890 to 1930 the death rate from diabetes increased from 5 5 to 20 6 per hundred thousand inhabitants We eat too much sugar! The preventive measure is obvious!

In a lesser degree the consumption of excessive amounts of other carbohydrates such as bread, cake, griddle cakes, potato, macaroni and spaghetti, corn, beans, and others, is responsible for causing diabetes They should be used in moderation and never combined freely in one meal or one day

Physical work and physical exercise at play is a daily desirable form of prevention of diabetes as well as obesity From clinical records it seems to be as useful in this regard to slender graceful people with expected diabetic inheritance as in the obese.

"For diabetes is found to be most prevalent among persons whose work requires the expenditure of relatively little physical energy and who have higher than average incomes" (Joslin, Dublin, Marks) "These basic conditions also explain some or most of the increase in diabetes throughout the world." (ibid) Work requiring energy has been reduced. Work previously done

by muscles has been transferred to the tending of machines Increase in population of cities often reducing the inhabitants of surrounding country districts has expanded the influence of this feature Moreover while people work less with their bodies there has been an increase of wages and other income so while reducing the actual demand for nourishment they have become well able to buy *more* and *more delicious* foods

Race seems to influence the occurence of diabetes Hebrews are known to be more susceptible than other races Most of them lead sedentary lives and use diets rich in sugar and other carbohydrates as well as fats Physical exercise and regulated diet would undoubtedly reduce their "susceptibility" The disease is not common in countries where small amounts of carbohydrates are devoured However the Japanese have the lowest death rate from diabetes among nations where records are available It is quite uncommon in the African race here and elsewhere Exercise and manual labor seem excellent preventive measures among most peoples where diabetes is rare

Age Increasing longevity in general is providing some of the increase in diabetes especially among women However most of these cases are of lower grade than in younger persons and although they may die with diabetes, it is only the accompaniment (or a handicap) in the death-dealing lesion In some cases the diabetes is not aggravated

Sex There is an astonishing increase of diabetes among women Joslin and Dublin think that this reflects the improvement in social position provided by domestic conveniences, lessening of manual labor, and by employing industrial enterprises to perform a certain amount of manual labor for them, as laundries and bake-shops In what proportions of homes, especially urban homes, is bread-making the age old ritual? Perhaps five to eight per cent And in most of these homes the easy bread mixer—some run by electricity—deprives the muscles of the hands, forearms, shoulders and trunk of that exercise that might burn up some of the carbohydrates and fats and ease up the strain on the islands of Langerhans They need a substitute set of exercises

The seeming increase of diabetes among child-bearing women as compared with the nulliparous does not mean that pregnancy has changed but the candidates therefor The presence of a positive or excessive nutritional energy balance explains this as well as many other things Our preventive medicine should comprise diet, safe exercises, and other measures calculated to keep this nutritional energy balance!

Geographically there is a much greater incidence of diabetes in the northeast section of the United States than in other parts of our country This does not mean that the preventive measure is a change of residence but of some habits as indicated in our talk thus far

Diseases of the gall-bladder and ducts and cholangitis exert destructive influences upon the islands of Langerhans by mechanical pressure as in stone in common duct, by spread of infection, and by new-growth invasion Here preventive treatment can be summed up in the recommendation that for this and many other reasons, these common seats of these common troubles deserve careful observation, detection, and correction, this entirely aside from their direct primary therapeutic value.

The tendency to develop arteriosclerosis and so general cardiovascular disease is accelerated by diabetes and this is the only known cause in many cases Therefore, as we said the other day at Kingston (see page 1939, November 15, 1937 issue of this JOURNAL), the prevention of diabetes and its treatment by the balanced diet and insulin is preventive treatment for cardiovascular disease

Acute infections in a small percentage of cases and chronic infection in many instances seem to reduce the capabilities of the islands and the many prevailing chronic infections (sinuses, teeth, tonsils, infective skin lesions, and others) should be cleared up as preventive measures of this and other diseases familiar to you all The early treatment of all soiled wounds preventing infection is also emphasized

Nervous influences such as emotional storms of anger, worry, and fear may cause or increase diabetes, especially when indulged in habitually, mental fatigue likewise Injuries to the brain and other parts of the nervous system are also credited with these responsibilities Mental hygiene and the prevention of injuries can therefore be numbered among the preventive measures

When we first suggested the renewal of

ne campaign for preventive medicine, one r our leading metropolitan surgeons re-narked "What can we do about it? It is ll summed up in five or six specific accines or serums"

In taking up with the District Branches ertain problems of prevention we are more han ever convinced that prevention is a ascinating field for intelligent scientific ndeavor

The theme of today illustrates how many ordinary things can be done to prevent obesity and diabetes How much more can be done when we have made more complete studies of records! Such a discussion as this merely scratches the surface

Throughout the entire subject, prevention revolves around the pivot of periodic health examinations A renewed effort to make such examinations, with complete competence in constantly increasing lists of health-conscious people, is our first goal

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR.P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Body and Mind

DOWNFALL

A mediocre writer with high ambitions, for many years unaware of his limitations, this patient had had a boisterous life like a rattling, rolling barrel half filled with junk His paranoid, half blind belief in his importance had helped him to stride over many obstacles He imposed himself by sheer audacity His steady pressure and insistence, his colossal impudence opened all the doors to him Some people first thought he must be great because he said so and others were sure that he was a genius because so it was rumored by 'the world" They accorded him respect and let him have his way because of his doubtless future greatness, as if advancing cash on credit What anybody else would consider a pastime, of no importance to others, he regarded and made his admirers regard as a master-piece and sold it for good money and much if ephemeral, glory And he "got away" with it As his reputation grew, he could get rid of all his trash and, with the help of a staff of secretaries, he kept on manufacturing more As a beginner he was loud about the distinguished personages he claimed to meet daily and about his familiarity with them But in due course of time this lie became a truth Even those who hated him or saw through his emptiness received him because of his success

In those years he was physically strong, erect and looked like that model of a perfect physique, the ancient Doryphore by Polycletus He wore his chin high and his keen eye pierced the world in search of somebody to fool And while flattering those in entrenched positions, he was arrogant with the poor, timid souls who never dared to affirm themselves

He was basking in the glaring social sun and swelling up with prosperity while the country was prosperous and could afford its nullities But as soon as the economic crash came, he was swept off his feet at one stroke and pushed to the wayside Suddenly nobody needed him and nobody missed him The soap-bubble in which he had lived collapsed It was like a heavy storm that shakes the woods and cleans them of all the rotten, worm-eaten boughs, although, of course and alas, many healthy limbs are also thrown to the ground.

But what a change!

Now our hero looked like a mangy and beaten dog Rapidly aging, he was stooping and walked with the humblest gait Not only his spirit was broken, but his body as well had shrunk His very spinal column seemed to have softened and shortened and bent He was a living example of the *interdependence of body and mind*

It was then that he came to the clinic for help The doctor, who had known him in his "good" days, listened to his woes with interest.

This patient's mental breakdown was entirely due to his dizzy rise and quick fall and to the contrast between the excess of attention he had enjoyed and the lack of attention from which he suffered now

There was nothing to do but to persuade him to begin life anew at the bottom, and to start with a modest job, which he did

NIPPED IN THE BUD

Husband and wife
Both cripples, both young

She has had an accident and a high amputation of one leg in early childhood, has an artificial contraption and, perfectly adjusted to her condition, walks, or slightly limps, quite ably

He has acquired his infirmity a few years ago only and moves slowly and with great difficulty, while she directs and helps him

But now he is coming, or rather she is bringing him, for another reason

Six months before, while crossing the street, they were both hit, slightly, by some small stones falling from a truck She made nothing of it, but he began to complain and is still complaining of an indefinite "pain" or, as he corrects himself, an unpleasant feeling, in the temple regions None of the clinics in our hospital found anything abnormal The eyes, the retinae, the ears, the equilibrium tests, Roentgen, neurological and medical examination were negative

In such cases the patients are sent to our mental hygiene clinic and it is in such cases that we must be on our guard lest there be a somatic trouble after all So the patient is re-examined as completely as possible and no sign of any disease is discovered The question is then, why does he suffer? Or does he suffer? And, if not, why does he think that he does?

The answer is in his mental make-up, which one understands after a talk with him He has had a bad life, being an orphan early, mistreated, morally bruised but never subdued, always reaching out and aspiring and never getting what he wanted or paying dear for it, in health and pride When finally, after great struggles, he became a civil engineer, his joy and triumph were quickly cut short and marred by the bad injury, sustained at work and which disabled him, probably permanently He would have ended his days then had it not been for his female friend who had courage enough for two and who became his wife

His mind is so conditioned, he will not believe that he could be "so lucky" as to escape from danger which, he was sure, had been again so close He expects a brain disease and, under such circumstances, if you expect it with certainty you may create it, that is *you may create the conviction that you have it* and some of its symptoms, at any rate the "pain"

All this is explained to him He is assured that the examination showed no disorder

Then his life is passed in review He has been fortunate that under his enormous handicaps he was so successful He still has his keen intelligence and his comparatively fine culture It would be a pity to ignore them and replace them by unworthy superstitions As a matter of fact even now, in spite of his lameness, he is earning a living again

He listens attentively and approves

Then the story, taken from a French author, is told about the fictitious character made out of nothing by one of the villagers and endlessly repeated and echoed through the town, each one adding his share of details and some proofs of its existence, until everybody accuses it of various mischiefs and all are afraid of it although no one has ever seen it This is how all the lovely genii and the ugly spirits, the saints and the devils, the demons and the deities have been born and have become realities This is how mythologies have developed Imagination is their mother An inherent necessity for the spiritual is their midwife Fear, imitation, ignorance nurtures, shapes and strengthens them until they, the non-existing man-made creatures, are his masters

This patient accepted the lesson His complaint vanished and he was completely —and quickly—cured A little later, when his scare would have made deeper inroads, it might have been too late

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

The next examination of the American Board of Obstetrics and Gynecology (written and review of case histories) for Group B candidates who have filed applications will be held in various cities of the United States and Canada on February 5

The general oral, clinical, and pathological examinations for all candidates (Groups A and B) will be conducted by the entire Board, meeting in San Francisco on June 13 and 14, immediately prior to the meeting of the American Medical Association

Applications for admission to the June Group A examinations must be on an official application form and filed in the Secretary's Office before April 1

For further information and application blanks address Dr Paul Titus, Secretary, 1015 Highland Building, Pittsburgh, Pa

New Year's Resolution

The medical profession faces a critical year Even if disturbed business conditions prevent the enactment of State or Federal health insurance laws in 1938, there is little doubt that a strong attempt will be made to lay the foundations for such legislation

Confronted with this and other serious threats to medical security, the profession nevertheless faces the future with courage and confidence As long as the mass of physicians refuses to be coerced or cajoled into systems detrimental to the public welfare and their own, medicine will retain its freedom

For the dangerous year ahead, organized medicine therefore resolves

1 To oppose to the limit of its resources any plan to bring medical practice under the control of a political bureaucracy or to subordinate informed medical judgment to the dictates of lay administrators

2 To aid, with more than lip service, any sound plan to bring better medical care within the reach of a larger portion of the population (It is a *sine qua non* of any such plan that it must safeguard the professional independence and economic rights of the private practitioner)

3 To work for a humane, discriminating system of distributing free and under-rate institutional service, in order to reserve all such facilities for the genuinely needy and prevent the exploitation of medical and civic generosity by those who can pay for private care

4 To seek a measure of compensation for the vast amount of service now rendered free by physicians With the shrinkage of private practice the profession can no longer carry alone, a burden which should be borne by the entire community

5 To elevate, insofar as possible with present knowledge and means, the standards of medical education and practice, and continue to bring to the public health the unselfish, expert service which has raised the art of healing to its present level

This is a big order It can be carried out only if every practicing physician utilizes his political and social influence in the service of his profession and the public health If this is done, medicine can really look forward to "A Happy New Year"

An Immediate Need

Congress has no more important task before it than the enactment of a vigor-

ous, comprehensive bill to protect consumers of food, drugs, and cosmetics—in short, the nation The present Food and Drugs Act is weak and obsolete in many respects It is inadequate in the fields it purports to cover and makes no mention of cosmetics, now one of the most fruitfull industries for fraudulent advertising dangerous to health

The tragic deaths last fall from "elixir sulfanilamide" would not in all probability have occurred if Congress had heeded the warnings of organized medicine, last year and for years past, and enacted a sane and sensible law to control the distribution of foods, drugs, and cosmetics, At present it is not necessary for new drugs to be tested before they are placed on the market Quoting from Secretary Wallace's report, "The fatal elixir was rushed into the market without adequate test to determine whether or not diethylene glycol may be safely used as a solvent for sulfanilamide, despite previously published reports in scientific literature showing that diethylene glycol may be dangerous when taken internally'

Even after the series of deaths came to public notice, the government had to look about for a pretext to intervene 'Since the Federal Food and Drugs Act contains no provision against dangerous drugs, seizures had to be based on a charge that the word 'elixir' implies an alcoholic solution, whereas this product was a diethylene glycol solution Had the product been called a 'solution' rather than an 'elixir', no charge of violating the law could have been brought"

This needless loss of life should bring home to Congress its responsibility for the enactment of an adequate law to regulate three industries that vitally affect every American home Heretofore such legislation has been thwarted by the powerful lobbies of the industries involved Their spokesmen in the Senate and House are past masters in the emasculation of control bills by amendment

Administration leaders, Senators, and Representatives who profess an interest in the public health could do the latter no better service than to throw their weight behind an up-to-date, effective food, drugs, and cosmetics law The hold of the "pain and beauty" lobbyists on Congress must be broken Till now they have only had to name a song and Congress has danced Will they still be permitted to call the tune after the recent dance of death?

Hollywood on Crusade

The disciples of Aesculapius and the pupils of Florence Nightingale have always been compelled to dwell in an atmosphere shut off from the world by a gate of clouds They occupied a position in the universe somewhere between mortal men and the divinities of Mount Olympus Concerning them, legends have arisen, some of which rival those so intimately associated with the deities of ancient Greece Literature abounds with hosannas for the God-like qualities of the physician The poet has extolled the loveliness of the white-capped "Angel of Mercy'

Of course these sentiments have all been remodeled to fit into our modern mythology While no longer God-like, the doctor still is kindly understanding, sympathetic and generous, particularly when he doesn t send his bill Every nurse is beautiful, gracious, and gentle except at such times when she just simply isn't! By whom and where has this remodeling been done? By none other than the celestial inhabitants of 'Mount Hollywood !

With meticulous finesse and canniness a definite piece of deviltry has been evolved First the appetite of the public was whetted by showing the mortal side of the Aesculapians and the Nightingales in "Men in White" Then came picture upon picture wherein every possible hackneyed plot was adapted to a hospital, an operating room or the office of a "fashionable doctor" By this time it

might be imagined that they would have run out of 'plots" calculated to dislodge the "Em Dees" and the "R Ens" from their pseudo-heavenly abode Ah, no! A Crusade is now contemplated!!!

Tucked away on page seven, Section Eleven of *The New York Times* of December 12, is an inkling of what is to follow A certain motion picture concern is "about to embark on another crusade This time it will be a picture exposing and denouncing quack doctors" It will "work in cooperation with the American Medical Association, whose aid has been pledged by Dr Morris Fishbein"

Jupiter has arisen in all his wrath and is bent upon expelling from our midst those unworthy of our calling Can he bridle the tendencies of Hollywood toward theatrics and give to the public a true expose of the quack and the charlatan in medicine? Then he will have performed a noteworthy service It is for him and his associates to hurdle the censorship of those states which consider the chiropractor, the naturopath, and the other cultists legitimate members in the brotherhood of Medicine

Dangers which would halt most mortals can have no meaning for the Olympians We in all humbleness would however remind Jupiter that "quack doctors" rarely possess the degree of Doctor of Medicine, and Hollywood must not use the medical profession as a springboard to launch a Roman holiday reeking in propaganda!

Smallpox A Plea to Legislators

An allusion to the value of vaccination against smallpox might elicit a yawn from our readers, as it also would have from us had we not been amazed to discover that the morbidity from this disease in the United States was at a level higher than that existing in other quarters of civilization During 1935, there were 7,904 reported cases of smallpox in the entire country and in 1936 the number was 7 813 [1] *During the first seven months of 1937, there have been 7,693 cases recorded* [2]

From the study of those gross figures, however, the reason for this large number of cases due to a disease which definitely is preventable cannot readily be understood It is only when the breakdown statistics are scrutinized that the real cause of this deplorable state of affairs becomes evident Using 100 000 as a unit of population, the incidence of smallpox follows [3] In the states which have passed laws providing for the compulsory vaccination against smallpox, *and there are only nine,* plus our national capitol, the incidence is 6 6 cases In those states which have *laws prohibiting compulsory vaccination,* the incidence rate was 115 2! In between these two are recorded figures which reveal the existing status of the disease in localities wherein no vaccination laws are on the statute books or where local option is permitted

To the medical profession the moral is obvious Could we but convince our legislators and certain misguided elements in our body politic that Organized Medicine has been, is, and always will be ever on the alert to protect the public health such a situation never would have occurred We represent, as a body, a mere 160,000 votes This nucleus, however, is a concentration of experts in the maintenance, preservation and restoration of the health of our people We have no axe to grind since, from a material standpoint, we physicians who ourselves are vaccinated against smallpox, can reap a richer harvest from treating this sickness than we can from preventing it Must smallpox again reach epidemic proportions before compulsory vaccination is enforced throughout our country? The physicians of the nation who are vitally interested in preventive measures against all illness earnestly beseech the enact-

ment of legislation which will aid them in eradicating all contagious and communicable diseases which concern the people as a whole Let us not await an incident of catastrophic proportions for the inauguration of measures which, while urgent for the occasion will, in retrospect, appear to be logical means to forestall future crises of a like nature

CURRENT COMMENT

"UNDER THE AUTHORITY OF THE social security act Federal and state agencies with the co-operation of medical, professional and welfare organizations now are embarked on the first nation-wide effort to reduce the toll of maternal deaths in the United States, 50 to 60 per cent of which are preventable, mortality studies have demonstrated

"As the result of a series of findings, based on the experience of the operation of Title V, Part 1 of the security act by which $3,800,000 is provided annually for maternal and child health services, a general conference will be held in Washington January 17 and 18 to consider extension of the program General agreement of the groups, meeting recently with officials of the Children's Bureau of the Department of Labor is that additional Federal funds in the form of direct grants to states are needed to meet the situation"—*The New York Herald Tribune* of December 5, contains an article of some length regarding the forthcoming drive to reduce the maternity death rate toll from which we have quoted the above

"THE LONGER AND MORE CRITICALLY one studies the history of our profession, the more one is impressed by the big hearts and gentle natures of the men and women who have made medicine what it is today Great hearts generally go with great minds"—An editorial statement in *The Medical News* of Rock Island (Ill) County Medical Society

"UNLESS ONE HOLDS HIS HEAD carefully in two hands to prevent it from spinning, it is hard to keep clear the dance of personalities and policies in Federal housing "—A pitiful comment by the editors of *The New York Times* of December 10

" APPROXIMATELY SIXTEEN MILLION young people between the ages of fourteen and twenty in the next seven years will becomes voters As such they will decide issues affecting every aspect of democratic freedom—political, economic, social, religious, and medical They cannot wait until they are twenty-one to learn how to decide issues unemotionally, critically, thoughtfully They must be learning now how to avoid decisions antagonistic to democracy From our own observations we might have these sterling thoughts broadcast at about 2 00 A. M when these potential nightwatchmen are at their best.

" The method usually employed to overcome vicious and obnoxious propaganda has centered about direct suppression and resistance, which often create an atmosphere of martyrdom and foster further resistance Suppression of free speech is far from popular in this country but exposure of sophistry is an effectual weapon in attaining the same end Knowing the truth was long ago demonstrated as a successful method for truth to establish freedom"—*The Weekly Roster and Medical Digest* of December 11 makes the foregoing statements, among many other pertinent ones, in introducing a new feature to its pages under the heading of "Propaganda Analysis"

"IT WILL BE REMEMBERED THAT Senator Wagner plighted his troth with the health insurance lobby last May The place was Indianapolis His audience, the National Conference of Social Work

"The gentleman from New York lost no time in taking the social workers to his bosom Greeting them as 'comrades-in-arms' and as 'the real standard-bearers of civilization,' he affirmed that the 'unity of purpose is now complete between the social worker and the public servant.'

"He proposed—in soft language, to be sure—an alliance between the social worker and the bureaucrat Together, he suggested, they would take the matter of health out of the province of the private practitioner To cinch the bargain, he promised quick extension of the Social Security Act for this purpose 'Vistas of human achievement stretch before us,' he declared ecstatically

"Happily, those vistas, so bright and shining to the Senator, and so black and threatening to the physician, are still before us, not behind us Of late, Senator Wagner and his colleague, Senator 'Ham' Lewis, have been remarkably quiet on the subject

"But Congress reconvenes in January The entire medical profession will be look-

ing to that session with its fingers crossed" —*Medical Economics* for December reminds us of an impending situation We hope that the profession will do more about it than keep its fingers crossed

"PENNSYLVANIA TO OFFER PNEUMONIA Serum to All" is the caption above the following news item in the *New York Herald Tribune* of December 10

"Pennsylvania today ordered erection of 2,000 highway billboards advertising free serum to shield its citizens from the ravages of pneumonia.

"Dr Edith MacBride-Dexter, Secretary of Health, said her department would place the signs along all highways to warn against the dangers of pneumonia and call attention to the preventive treatment offered without cost to all Pennsylvanians for the first time.

"Her announcement came as the first cold spell tumbled thermometers and renewed dangers of the disease, which in 1936 caused 9,094 deaths in the Keystone State

"The free serum, made possible through a $60,000 Federal grant, will be available beginning December 15th *to all who apply through private physicians*" (Italics ours)

"THE FAMILY DOCTOR" IS AGAIN THE subject of editorial comment—this time in the *Medical Record* of December 1 We quote in part "In the attempts being made everywhere to initiate and foster health, cooperation of the family doctor is essential, although as a rule, his services are not made use of, to the extent they should be He is the key to the whole problem of establishing and maintaining the health of the population More than anyone he is in touch with the people in their homes It not as much as formerly, he yet remains more than anyone else, the guide, philosopher and friend of the family and the most potent force in schemes of health education The machinery to bring about this end can never advance far or run smoothly without his earnest cooperation 'Earnest' is said advisedly, as what plan can succeed unless behind it are men keen to push it along and whose heart is in their work

'A Nation's health depends largely upon the family doctor and not until this fact is recognized will any real progress be made"

"'IT IS JUST AS IMPOSSIBLE to standardize humanity's wants and to provide for its every desire as it is to commune with the spheres The two institutions which have stood the test of time are religion and medicine, yet these are the very structures which are being attacked on all sides It is quite easily understood why the practice of medicine should be selected, because governmental powers realize what an important item it is in our social structure It may interest you to know that medical care occupies the third position in the item demand for the existence of man'" Dr Seth A Brummer, former president of the Philadelphia County Medical Society, terming "efforts to socialize medicine and dentistry in this country as the work of 'tricksters' who are seeking to lure a gullible public with a 'smoke screen'", addressed a section of the Greater New York Dental Meeting in New York City recently, and we have quoted the above from the *The New York Times* report of the meeting

---

Katharine F Lenroot, Chief of the Children's Bureau, U S Department of Labor, announces that at the request of various professional groups and national organizations interested in maternal and infant health and welfare, the Children's Bureau is calling a conference on Better Care for Mothers and Babies to be held in Washington, January 17 and 18

The annual meeting of the Associated Physicians of Long Island will be held at St. Mary's Hospital, Buffalo and St. Mark's avenues, Brooklyn, on January 29 The scientific program of the meeting will be prepared and presented by the professional staff of St. Mary's

CAST THY BREAD—

The young doctor sat wearily down in his easy chair, and asked his wife affectionately

"Has my darling been lonely?"

"Oh, no," she said, "at least not very I've found something to do with my time"

"Oh," he said. "What is it?"

"I am organizing a class A lot of women are in it, and we are teaching each other to cook"

"What do you do with the things you cook?"

"We send them to the neighbors"

"Dear little woman," he said, kissing her, "always thinking of your husband's practice."—*Medical Record*

The American Medical Association Broadcasts

The voices heard in the broadcast plays of the American Medical Association every Wednesday at 2 P M are those of professional actors drawn from the Chicago Artists' Bureau I had the privilege of witnessing their performance on December 1 The topic for that day was "Tuberculosis foe of youth" Harrowing moments were provided when the young girl about to enter college is told that she has tuberculosis, when she finds on entering a sanatorium that her school friend who preceded her has just died and there is yet another death before the happy ending How do the trained actors behave in these emotional scenes? Their hands are occupied in holding their script But the muscles of the face and neck are just as responsive to the situations as the intrinsic muscles of the larynx "No, No No!" says the young girl, resisting the doctor's verdict, and she shakes her head as vehemently as she speaks her part

There are eighty-eight stations in the red network of the N B C, and each of these may receive and broadcast the school health program of the American Medical Association But since it is an educational and not a commercial program, they are not obliged to do so Physicians interested in health education will wish to investigate the use of these programs locally and will use their influence with local school boards and, if necessary with the radio stations, to make them available to the children

To help school teachers, the American Medical Association publishes a set of "briefs" reprinted from *Hygeia* which supplement the teaching of the plays, suggest "projects" for the students and source material for the teachers Also available is a pupil's work book and guide.[1] It is easy to criticize some of the suggestions in this work book Do we really want our children taught at all times to avoid crowds lest they get poliomyelitis? Should vegetarianism really be placed first among "food fads"? The authors will no doubt gratefully receive expressions of opinion which differ from their own They are quite prepared to modify subsequent editions of the work book in the light of experience

The educational possibilities of this organized educational program are enormous I believe we should be proud of the energy and initiative of our Association which has given it birth

THE MEDICAL BUILDING AT THE BIG FAIR

For the first time in any international exposition, a separate building has been assigned by the New York World's Fair of 1939 for presentation of the story of medicine and public health This building, to be erected by the Fair Corporation, will be in the heart of the exposition's exhibit area, on the northern side of the Theme Plaza Not as yet named, it will house "A World of Health"

The exhibits for this building are being planned by a General Advisory Committee, composed of 101 national, state, and local authorities on medicine and public health, appointed by Grover Whalen President of the Fair Dr Victor Heiser is chairman of this committee

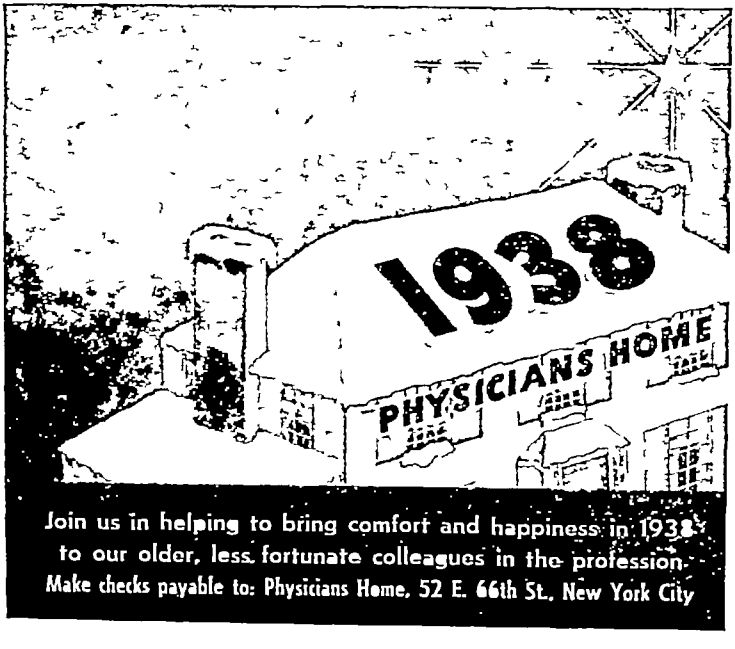
Included in the exhibit will be presentations of the latest discoveries, devices, and advancements in every phase of medicine and health, indicating, in new and dramatic manner, what man may do to take utmost advantage of the store of scientific knowledge now available to insure his health and that of his family

Collected in the Health Building the visitor will find colorful and animated displays portraying man's anatomy and physiology and the dynamics of his bodily functions The construction and operation

of the digestive system, of the nervous and respiratory systems, and of the glands of internal secretion which have such marked effect on human personality and physical characteristics, will be shown in so simple a manner that descriptive matter will be kept to a minimum But, where this may be absolutely necessary, it will be presented in the plain language of the layman

The building devoted to medicine and health will be divided into three main chambers of great size, to be designated as The Hall of Man, The Hall of Medical Science, and The Hall of Public Health Each of these halls will be subdivided into sections, as yet only tentatively planned, developed under the eye and skill of experts in the particular fields they cover

The theme of The Hall of Man will be expressed on a prominent entablature by this excerpt from the writings of St Augustine



> Man wonders over the restless sea, the flowing water, the sight of the sky and forgets that of all wonders man himself is the most wonderful.

This Hall will present the normal human anatomy and, to an extent, its physiology Here will be shown the digestive system the dynamics of the circulatory system and other bodily activities the functions of the glands, the mechanisms of the special senses, sex determination and the development of the human organism Among the exhibits to be found here will be models of various parts of the body reproduced in huge size and mobile in construction so that their operation is demonstrated in arresting and understandable fashion

In The Hall of Medical Science it is planned to show some of the more important complications which beset the human being, their causes, how they may be prevented or cured and the services available to this end Among the sections in view for this chamber will be those devoted to cancer, tuberculosis pneumonia the common cold and other respiratory diseases diphtheria infantile paralysis, heart disease, diabetes, venereal diseases and infections

As at present conceived The Hall of Public Health may emphasize the problems of society in this wide field how they are being met and how they relate to the individual Some of the proposed sections are maternal health infant and child hygiene, heredity and eugenics mental hygiene industrial hygiene, safety and first aid sewage disposal and water supply intestinal diseases such as typhoid fever and dysentery the control of communicable diseases, the relations of insects to disease, maritime quarantine deafness, blindness and harmful superstitions

---

SERUM IN PNEUMONIA

That the physicians of the State may have concrete examples of different phases of anti-pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti-pneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Case 9

Report from the records of Dr Charles L Nichols, Philmont

"A thirty-three year old white female adult with a history of sensitivity to dust and ragweed, who had had severe asthma associated with attacks of acute bronchitis, and with annual attacks of hay fever, had a sudden onset of shaking chill followed by fever, pain in the chest and cough productive of a rusty sputum on February 12, 1937

"On the day following onset, the patient had a temperature of 104 6, pulse of 140, and respirations of 38 At that time there were signs of consolidation over the left lower lobe The patient was very ill, but had had no asthmatic symptoms Examination of the sputum revealed Type I pneumococcus There was no history of allergy so far as horse emanations were concerned, and skin and eye sensitivity tests were immediately done These both proved to be negative, and serum therapy was cautiously begun No reactions occurred, and by the end of twenty-four hours the patient had received 120 c c (150,000 units) of Type I concentrated antipneumococcus horse serum

"The patient's response was immediate Her temperature dropped 2 degrees during the first twelve hours after therapy was started Temperature, pulse, and respirations were normal on the morning of the third day of the disease, February 15 Patient was discharged well, fourteen days following onset, February 27"

This case report is an excellent example of the fact that horse serum can safely be given intravenously to an individual with history of allergy provided that no specific allergy against horse serum or horse emanations exists In this case the patient showed no evidence of sensitivity to horses as shown by negative history with respect to horse emanations and negative skin and eye tests, even though she was highly allergic to other things However, the allergic background indicated the cautious use of Type I antiserum Serum treatment was carried out with an excellent therapeutic result.

Knowledge concerning serum reactions is far from complete. However, on the basis of the small amount of existing evidence, the following is a fair working outline of the treatment of serum sensitive individuals

True anaphylactic shock in man following the injection of serum is rare Most, but not all, of the fatal cases have occurred when serum was injected for the first time in an individual sensitive to horse emanations A few deaths have been reported following the second injection of serum in an individual who had a previous serum injection These latter usually occurred when the injection was given intravenously within six months of the time that the first dose had been given

It is necessary to separate the nonspecific reactions which are due to substances present in the serum from the reactions resulting from those of specific sensitivity to horse serum The nonspecific reactions are usually manifest by immediate thermal response with shaking chill and high fever, and are rarely fatal

With these facts in mind, one should not hesitate to give serum to patients with asthma or hay fever who are not horse sensitive However, it is necessary to exercise a great deal of caution If the skin and eye tests are negative an intravenous test dose of ten c.c of a 1 to 100 dilution of serum at the rate of one c c. per minute may be attempted If no reaction occurs following this injection, the therapy may be continued in the usual fashion If, however, the skin test is positive and the eye test negative, one should proceed even more cautiously with gradually increasing doses by the subcutaneous and intramuscular routes, before the first intravenous dose is given. If the eye test is also positive, extreme caution should be observed and a preliminary "desensitization" should be carried out over a long period of time with very gradually increasing doses given until one c c of horse serum has been given intramuscularly without significant reaction before the intravenous therapy is commenced The same technic should also be followed in patients who have had a previous injection of horse serum prior to six months before the present injection

In patients who are definitely sensitive to

horse emanations or who have had serum during the six months' period prior to the present injection with a positive skin test, no serum should be given unless extenuating circumstances exist In the event that a patient has bacteremia where the mortality is approximately seventy-five to eighty-five per cent, however, one would feel justified in attempting to treat such patients

It is, of course, necessary to have a syringe at hand containing one c c of 1 to 1000 sterile solution of adrenalin before skin tests are performed or serum treatment is carried out on any patient

New York City Refresher Courses

The Department of Health of New York City is about to arrange with the help of the five County Medical Societies in the Metropolitan Area, "Refresher Courses in Pneumonia" similar to the "Pneumonia Institutes" held elsewhere throughout the State by the State Department of Health

The five County Medical Societies of Bronx, Kings, New York, Queens, and Richmond invite applications to the number of fifty for each of these courses The details as yet of hospitals to be selected, and dates, have not been assigned, but the Secretaries of the County Societies are ready to receive applications The courses are to be held during January The names of the Secretaries and their addresses are

Dr Henry Friedland, Secretary, Bronx County Medical Society, 4751 Park Avenue, Bronx.

Dr Alec N Thomson, Executive Secretary, Medical Society of the County of Kings, 1313 Bedford Avenue, Brooklyn.

Dr B Wallace Hamilton, Secretary, Medical Society of the County of New York, 2 East 103rd Street, New York.

Dr Frank R. Mazzola, Secretary, Medical Society of the County of Queens, 112-25 Queens Boulevard, Forest Hills

Dr John J Goller, Secretary, Richmond County Medical Society, 25 Central Avenue, St George, Staten Island

Those members of the State Society residing in New York City who applied last year to Dr Thomas P Farmer of the State Council Committee on Medical Education will be given priority in assignments to particular dates by Dr Wheelan D Sutliff, Director of the Pneumonia Control Program of the New York City Department of Health

PETER IRVING, M D, *Secretary*
Medical Society of the State of New York

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

KINGS COUNTY The Woman's Auxiliary to the Medical Society of the County of Kings was delighted to receive a letter from the President of the Medical Society of the County of Kings, Dr Thomas A. McGoldrick, asking us to help the County Medical Society and Academy of Medicine of Brooklyn and the Doctor's Club of Brooklyn in making the testimonial dinner to our New York State President, Dr Charles A Goodrich a success

We are forming committees and are trying in every way to help in making the evening one long to be remembered.

We are anxious to have every Auxiliary member on some committee so when you are approached to serve please say "yes"

We are delighted to honor Dr Goodrich and the profits of the evening's special entertainment will go towards the F D Jennings Memorial Building Fund

The annual meeting of the Kings County Auxiliary was held on December 14 at the Society Building Election of officers took place followed by bridge and tea

NASSAU COUNTY On December 15, the Woman's Auxiliary of Nassau County held election of officers Dr Courtney R Hall spoke on the medical history of Long Island.

QUEENS COUNTY Queens County held its annual election of officers on November 30 Mrs Elmer Kleefield is the newly elected President On December 28, at the Medical Society Building in Forest Hills, the Auxiliary held an installation of officers

ROCKLAND COUNTY Rockland County Auxiliary held a luncheon meeting on November 17 at the Bear Mountain Inn Mrs S W S Toms, the Auxiliary's first President was honored as retiring head of the Auxiliary Mrs Toms has been succeeded as President by Mrs Alexander Selman Dr S W S Toms spoke on the work of the Auxiliary

Dr W J Ryan gave an illustrated talk on tuberculosis

Medical News

Albany County

DR EUGENE VAN SLYKE, eighty-six, dean of Albany's physicians and one of the oldest medical men in the state, died on Nov 8 at his home in Albany after a short illness He practiced sixty-six years

Allegany County

DR LAWRENCE C OLDER was elected president of the Allegany County Medical Society at its annual meeting in Belmont Nov 4 Other officers chosen were Dr P L Morrison, vice president, Dr E F Comstock, reelected, secretary, Dr H J Rubenstein, treasurer, Dr Lyman C Lewis, delegate to the state society, Dr Batt, chairman of the Board of five censors

County Bacteriologist William Greene and Charles E Covill, committee from the Allegany County American Legion, met with the doctors to get suggestions of the society how the county Legion might best aid in some humanitarian work in the county Dr Older appointed the following committee to continue the matter with the I egion committee Dr H K Hardy, Dr Nathaniel H Fuller, and Dr S B Scott

Broome County

THE ANNUAL MEETING OF THE Broome County Medical Society was held in the Arlington Hotel Art Gallery in Binghamton on Dec 14 Officers were elected

At the scientific session a paper was presented on "General Aspects of Health Administration," by Arthur W Cummings M D, District State Health Officer There was discussion by C J Longstreet, M D, W J Farrell, M D, and Mark Welch, M D

Cayuga County

DR GEORGE B ADAMS was elected president and Dr M L Seccomb vice president of the Cayuga County Committee on Tuberculosis and Public Health at the annual meeting in Auburn on Nov 16

Chemung County

THE ANNUAL MEETING of the Chemung County Medical Society was held at Elmira, on December 2 Officers were elected as follows President, Elliott T Bush M D Vice President, Rene Breguet M D, Secretary, Robert J Lawler M D, Treasurer Sven L Larson M D, Delegate to State Medical Society, Ross G Loop M D, Alternate, Herbert W Fudge M D

The annual dinner of the Society will take place at the Mark Twain Hotel, Elmira, on January 5, at seven o'clock The guest speaker will be Frank H Lahey M D of Boston, Mass, whose subject will be 'Some of the Newer Clinical and Laboratory Developments in Thyroid Disease"—*Reported by Robert J Lawler M D, Secretary*

Cortland County

DR. FLOYD S WINSLOW, immediate past president of the New York State Medical Society, addressed the Cortland County Medical Society at a special meeting on December 16 Subject "Experiences as a Coroner's Physician"

The regular December business meeting and election was held on December 17—*Reported by O E White, M D, Secretary*

Erie County

WITH MORE THAN 100 Buffalo physicians and dentists cited as victims to the extent of $5 each, police held a man identified as Albert Shaffer of Newark, N J, accused as a magazine racketeer Police say he is wanted in a dozen other cities for questioning about a similar racket They charge him with obtaining property by false pretenses and second-degree forgery From sales slips and receipts found in his hotel room and from information obtained by the Buffalo Better Business Bureau, police deduced Shaffer approached physicians and dentists, presented fake credentials and offered them subscriptions to a popular magazine plus a choice of several medical books for $9 A deposit of $5 was to be given to the agent

LACK OF PROPER HOSPITAL supervision of maternity cases is one of the "most important contributing factors of maternal and fetal mortality," Dr Milton G Potter asserts in the monthly bulletin of the Buffalo Academy of Medicine

"Certain maternal and fetal mortality cases are inevitable regardless of the excellence of prenatal care and the most conservative of delivery procedures," he explained "All obstetricians realize this fact and while the emphasis placed upon prenatal care is very important, it would appear the

ay organizations, and the various survey committees, and the profession have overlooked, in their enthusiastic zeal, this most important contributing factor of maternal and fetal mortality"

The lack of supervision, Dr Potter said, 'is quite evident in Erie county, and must be corrected in the near future by the hospitals and the profession"

Through staff supervision of obstetrical patients, Millard Fillmore hospital has made great progress in efforts to cut down the number of deaths caused in childbirth, he stated

DR. F M BOYLE, one of the best known physicians in South Buffalo, died at his home, after a short illness, on Dec 2 Dr Boyle had been in practice for forty-five years

THE SCIENTIFIC SESSION of the Buffalo Academy of Medicine on Dec 8 was devoted to a symposium on "The Acute Abdomen" by the Deaconess Hospital staff with Alfred H Noehren, M D, past-president of the staff in the chair Speakers were Kenneth H Eckert, M D Nicholas N Linderman M D, Robert B Newell, M D James C Sullivan, M D

At the meeting of the Academy Section on Obstetrics and Gynecology on Dec 15, Dr Thaddeus Montgomery, of Philadelphia read a paper on "Choice and Management of Obsterical Anesthesia and Analgesia"

Franklin County

DR D M BRUMFIEL was elected president of the Franklin County Medical Society at the annual meeting in Malone on Dec 1

Other officers named were Dr E M Austin, vice-president, Dr Daisy H Van-Dyke, secretary-treasurer, Dr J N Hayes, censor, three years, Dr C C Trembley, delegate to the state society, Dr John E White, alternate

In the scientific session that followed the business meeting, Dr William Cone of Montreal described head injuries and Dr P E Stamataides outlined a bronchoesophageal fistula case observed in the Alice Hyde hospital

DR J E MEAKINS of the Royal Victoria hospital, Montreal, spoke on "Systemic Effects of Pulmonary Disease" at a meeting of the Saranac Lake Medical society on Dec 1

Herkimer County

TALKS IN FAVOR OF establishing a district nursing system in Herkimer county were made at the meeting of the Board of Supervisors, on Nov 22 by Dr Halsey J Ball of Utica, district state health officer, and Dr James W Graves, health officer of the village and town of Herkimer Both speakers maintained that such a system would work to the advantage of families residing in rural districts, which are without district public nursing service

Dr Ball mentioned that the county has at present a nurse whose duties are confined wholly to tuberculosis cases and whose work is carried out at an annual cost of $2,000 He suggested that this appropriation be increased to $3 500, in which event the state would set aside a like sum making a total of $7,000

With this sum, Dr Ball said the county could have four nurses engaged in generalized work and not confined to tuberculosis cases He said the plan would be to divide the county into four districts, each to be under supervision of one of the nurses The speaker cited numerous ways in which the nurses would function for advancement of the public health of persons residing in the rural districts

Kings County

THE NEW $250,000 RED HOOK GOWANUS Health and Teaching Center at 250 Baltic St eighth city-built and PWA-financed health center building to be opened in the five boroughs this year, was dedicated by the Health Department on Nov 30 The structure is the second unit in the city's cooperative program with five medical schools for utilizing district health work as a training ground for medical students and Health Department personnel in preventive medicine and public health administration

The teaching program in the Red Hook-Gowanus district will be in cooperation with the Long Island College of Medicine, located within close proximity The medical school's department of preventive medicine and community health, under the direction of Dr Alfred E Shipley, former Deputy Commissioner of Hospitals, is housed in the health center building which has all facilities for maintaining a well-rounded public health service for the community with emphasis on preventive medicine and health education

More than 200 representatives of Brooklyn's voluntary health and welfare agencies medical and dental societies and business and professional groups participated in the dedication ceremonies Mayor LaGuardia Borough President Ingersoll and Health Commissioner John L Rice were principal speakers and Dr Shipley presided

Other speakers were Dr Frank L Babbott, president, Long Island College of Medicine, Dr John B D'Albora, president-elect, Kings County Medical Society, Dr Charles S Prest, secretary, Brooklyn Tuberculosis and Health Association

THE RIDGEBORO MEDICAL SOCIETY met on Dec 9, at the Kings County Lighting Company Dr Charles H Smith discussed "Acute Pneumonia in Children," and Dr H Greenwald, "Pneumonia in Infants" Officers were elected

DR CHARLES EASTMOND, specialist in roentgenology, chief of the X-ray departments of Peck Memorial Hospital and Beth Moses Hospital, Brooklyn, died on Nov 27 at Peck Memorial Hospital, Brooklyn He was fifty-eight

Dr Eastmond was a former president of the New York Roentgen-Ray Society, a former chairman of the Eastern section of the American Roentgen-Ray Society and a former secretary of the New York Gastro-Enterological Association He was the author of numerous articles on roentgenology in the medical journals and had contributed to Butler's "Diagnostics of Internal Medicine"

He was consulting roentgenologist at the Norwegian Hospital, the Harbor Hospital, Jamaica Hospital, Nassau Hospital, Jewish Hospital and the Long Island College Hospital, where he formerly lectured on roentgenology

Madison County

THE ONE HUNDRED AND FIRST Annual Meeting of the Madison County Medical Society was held at the Hotel Oneida, Oneida, on Dec 16 At the business session officers were elected Then the society listened to these papers "Urinary Infections, With a Review of the Newer Urinary Antiseptics," by Dr Leo E Gibson "Toxemias of Pregnancy," by Dr Edward C Hughes, illustrated by lantern slides "President's Address," by Dr A J Zaia. At the dinner session an address was delivered on "The Inter-relations of the Science and Art of Medicine," by Dr W A Groat, President-elect of the State Society A paper was read at the evening session on "Spontaneous Intracranial Hemorrhage" by Dr W D Ayer, illustrated by lantern slides

Nassau County

NEARLY 200 MEMBERS OF THE Medical society of the County of Nassau heard William F Ploch, president of the National City Bank of Long Beach, outline the methods of high pressure stock salesmanship and get-rich-quick-schemes at the Bar association clubhouse, Garden City, on Nov 30

Appearing as the guest of Dr Henry E Smith, president of the society, Mr Ploch declared that nearly every professional man is on so-called "sucker lists" of high pressure investment firms

Mr Ploch outlined some forms of reasonably safe investments in life insurance, United States bonds, high grade corporate bonds, capital bonds and preferred stocks, pointing out the advantages of each

New York County

THE FRIDAY AFTERNOON LECTURE at the New York Academy of Medicine on Jan 7, at 4 30, will be on "Treatment of Pneumonia," by Dr Rufus Cole, and the lecture on Jan 14, at 4 30, will be on "Cancer of the Gastrointestinal Tract," by Dr Carl Eggers, of the College of Physicians and Surgeons

A LECTURE OF THE New York Heart Association series will be given at the New York Academy of Medicine on Jan 11 at 4 30 P M on "The Management of Rheumatic Infection," by Homer F Swift, M D

A Scientific Session will be held on January 18 at 8 30 P M, in Room 20 of the Academy of Medicine As this will be the annual meeting of the Association, a brief resume of the year's activities will be given by Dr Ernst P Boas, Chairman This will be followed by the presentation of two scientific papers "Oxygen Therapy in Heart Disease" by Dr A L Barach of the Presbyterian Hospital, New York City, "Pulse Wave Velocity" by Dr J Murray Steele of the Hospital of the Rockefeller Institute, New York City

Another lecture on January 25 at 4 30 P M will be "The Management of Cardiovascular Emergencies" by Lewis A Connor, M D

DR EUGENE H POOL, senior attending surgeon of the New York Hospital and professor of clinical surgery in the Cornell University Medical College, has been elected an alumni trustee of Columbia University at a meeting of the university trustees He will fill the vacancy caused by the death of Dr Everett W Gould on Aug 18

THE NEW YORK POLYCLINIC MEDICAL School and Hospital announces the following appointments to its staff, Dr Thomas G Tickle as Professor of Otolaryngology

Dr David H Jones as Clinical Professor of Bronchoscopy Dr Ernest E Smith as Adjunct Professor of Roentgenology

At the January meeting the following program will be presented

"Foreign bodies in the air and food passages with particular stress on Peri-esophagitis" by David H Jones, M D "Bronchogenic Carcinoma" by Charles E Wolcott, M D "Lung Abscess" by H. Griffen Bullwinkel, M D (Lantern slide demonstration) "Present problems in Diabetes" by Elliott P Joslin, M.D, Boston, Mass The discussion is to be opened by Herman O Mosenthal, M D and Frederick M Allen, M D

Dr. Maurice J Lewi, who was secretary of the New York State Board of Medical Examiners for twenty-two years before he resigned to become president of the First Institute of Podiatry, was the guest of friends at a dinner on Dec 1, in honor of his eightieth birthday Among the guest speakers were Dr Iago Galdston, of the New York Academy of Medicine, John Boyd Thacher, Mayor of Albany, Dr James J Walsh, organizer and former dean of Fordham Medical College, and Judge Edward J McGoldrick Telegrams were received from President and Mrs Roosevelt.

Niagara County

Dr. Clyde W George, president of the Medical Society of the County of Niagara and Assistant Superintendent of the Niagara Sanatorium, ex-officio member of the Board of Directors of the Tuberculosis and Health Association of Niagara County, gave an interesting talk on Dec 1 over station WKBW Buffalo He took as his topic "Early Diagnosis of Tuberculosis and the Need for Early Hospitalization"

Oneida County

Utica will join in the observance of Social Hygiene Day, Feb 2, when a speaker of national repute will be heard at a meeting in Hotel Utica The speaker will be Dr J H Stokes, Philadelphia, one of the most widely quoted authorities on the subject of social hygiene The meeting will be sponsored by the health group of the Utica Council of Social Agencies and will be conducted in conjunction with a meeting of the Oneida County Medical Society

Dr. Hugh H. Shaw, health officer of Utica has been named a member of the medical council of the National Foundation for Infantile Paralysis

Onondaga County

Dr. Anton W Sohrweide addressed the Syracuse Dental Society at their dinner-meeting on December 14 The subject of the evening was "Diseases of the Oral Mucosa" The lecture was illustrated with lantern slides and a general discussion followed.

Dr. Herman G Weiskotten, dean of the Syracuse University College of Medicine, spoke on "Trends in Medical Education" at a meeting of the Syracuse Academy of Medicine Dec 21 Other speakers were Dr Lee A. Hadley, on "Schuller's Disease, Xanthomatosis," Dr R D Johnson, on "Dilation of the Esophagus," and Dr Frederick N Marty, on "Malaria Following Transfusion"

New officers were elected.

Ontario County

The prevalence of nutritional deficiency diseases in everyday life and the difficulties of diagnosis were pointed out to the fifteenth annual dinner meeting of the Geneva Academy of Medicine by Dr Russell L Haden, of the Cleveland Clinic, on Nov 18

Meeting at the Hotel Seneca, some forty-five physicians and dentists from Geneva, and surrounding territory, with guests from Buffalo and Southern Tier cities heard Dr Haden speak on the subject of "The Clinical Problem of Nutritional Deficiency Disease"

Dr Haden also outlined methods of diagnosis and treatment Discussion was led by Dr Nelson Russell

Queens County

The first annual sixty-page "Bulletin" published by the Queens County Cancer committee, made its appearance in connection with the "Cavalcade of Hits," elaborate variety musical revue presented as a benefit to help finance the work of the Cancer Committee, in December

Numerous articles on cancer, its causes, stages of development and cure appear in the magazine, with articles by three international cancer experts, Dr Francis Carter Wood and Dr James Ewing of the American Society for the Control of Cancer and Dr John J C Gerster, chairman of the New York City Cancer Committee

Other authors whose stories appear are John Adikes president of the Queensboro Chamber of Commerce, Dr James R Reuling, retiring president of the Medical Society of Queens, Dr Carl Boettiger, founder and honorary president of the Queens

County Cancer Committee, Dr Mandel Weinstein, chairman of the committee, and John H Schleif of the Bank of Manhattan Company and treasurer of the Queens committee

Rennselaer County

PHYSICIANS OF TROY and surrounding communities stretching out as far as Schenectady, Glens Falls and Bennington, Vt, interested in children's diseases, heard an address on "Diphtheria Prevention and the Schick Test" by Dr Hugh Chaplin, at the Day Home in Troy at the invitation of the board of trustees and the medical and surgical staff of the institution on Nov 23

Richmond County

DR WILLIAM C BUNTIN, Sanitary Superintendent of the Health Department in Staten Island, and as such head of the department in that borough, died December 19, at Staten Island Hospital, New Brighton, after a few days' illness He was fifty-eight years old

He was extremely civic-minded and took part in many activities He had served two terms as president of the Richmond County Medical Society, six years on the Coordinating Council of the metropolitan county societies, and had a record for attendance unsurpassed He was president of the First District Branch of the State Society

He was director of the Staten Island Chamber of Commerce, one of the founders of the Kiwanis Club of Staten Island, and a promotor of the Staten Island Community Chest, which was organized only a few months ago

Surviving are his wife, Ione, and a sister, Mrs Emma Drummond His home was at 31 Park View Place, New Brighton

Rockland County

DR FREDERICK A SCHROEDER was elected president of the Rockland County Medical Society at its annual meeting and banquet held at Spring Valley on Dec 1 He succeeds Dr George W Unsworth

Other officers named included Dr Julius Pomerantz, vice-president, Dr William J Ryan, secretary Dr Dean Miltimore, treasurer, Dr Stephen Monteith, delegate to the State convention and Dr Ryan alternate

The principal address of the evening was presented by Dr Bradley H Kirschberg director of the Schenectady laboratory department of the State police bureau of criminal investigation

Schenectady County

DR A B VAN VRANKEN was elected President of the Schenectady County Medical Society at the annual dinner meeting of the organization in Schenectady on Dec. 2 Dr Van Vranken succeeds Dr Clarence F Ackerknecht

Named to office with Dr Van Vranken were Dr J R Schermerhorn, Vice-President, Dr Charles Wiedenman, Treasurer, Dr Isaac Shapiro, Secretary, and Drs A A Samorini, A S Fay and Frank White, Censors Dr Wiedenman and Dr Shapiro were reelected. Dr William Treder was elected delegate to the State Medical Society and Dr Charles Rourke to the Fourth District Branch of the Medical Society

Reports of officers and committees were heard and Dr C C Woodall showed motion pictures of a recent trip abroad

Tioga County

THE ANNUAL MEETING OF the Medical Society of the County of Tioga was held at the Green Lantern Inn, at Owego on December 7 These officers were chosen President Dr C S Johnson, Vice-President Dr C J V Redding, Secretary-Treasurer Dr I N Peterson, Delegate Dr W A Moulton

After brief remarks by the outgoing and incoming presidents, Dr Edward S Rogers of the New York State Bureau of Pneumonia Control, presented a talking picture on the "Technic of Serum Administration" which was followed by a round-table discussion —*Reported by I N Peterson, M D, Secretary*

Wayne County

AT THE ANNUAL MEETING of the Wayne County Medical Society at Lyons, on December 7, the following officers were elected President, E A Baumgartner, First Vice President, Edward Platt, Second Vice President, Charles Steyaart, Secretary-Treasurer, James L Davis, Censors, M E. Carmer, Arthur Besemer, George S Allen, Delegate, Ralph Sheldon, Alternate, Sam Houston

The Scientific program was as follows "Undiagnosed and Misdiagnosed Genitourinary Pathology" by Dr Arthur H Paine, and "The Common Skin Diseases and Their Treatment" by Dr Clarence H Peachey —*Reported by James L Davis, M D, Secretary*

Hospital News

When the Hospitals Themselves Are on the Sick List

OUR HOSPITALS ARE SPLENDIDLY equipped to care for the ill, but when the hospitals themselves are sick, who will be the doctor to put them on their feet? That the voluntary hospitals of New York City are in a bad way is the disturbing diagnosis of no less an authority than the President of the United Hospital Fund, Mr David H McAlpin Pyle, and he has named a committee of eight to prescribe remedies, with 'other appointments" to "be made in the near future." A consultation of that size looks as if the patient is in a parlous state, perhaps, but also seems to indicate that something effective is going to be done about it.

"Shocking" is the word used by Mr Pyle in a statement made to the trustees of the Fund on December 7 The hospital survey "has demonstrated the shocking lack of coordination between ourselves, hospitals under other types of control, convalescent homes, homes for the chronically ill, independent dispensaries, and visiting nurse groups," he said And not only that, but the very people who ought to see the situation, are blind to it "Few of our hospital trustees," he avers, "because of their deep concern with financial matters and with the operation of their own institutions, are sufficiently sensitive to the relationships that should exist between hospitals and the many kinds of other agencies in the health and welfare field"

Helter-Skelter Growth

The helter-skelter way in which the voluntary hospitals of New York City have developed has produced a regrettable state of affairs, he points out. In his own words

There are too many of some kinds of hospital beds, too few of others In some locations there is an abundance of facilities, elsewhere there are shortages Some hospitals have received endowments, accumulated surpluses, raised current contributions, accepted tax exemptions, and yet have failed to give in return an equal value of free care to those who can afford to pay nothing or little toward the cost of their care. Uneconomic costs are evident in certain of our institutions Some are rendering services below a satisfactory standard. A great many underpay their employees and work them long hours A few should be closed forthwith as unnecessary, uneconomic units in an integrated plan of city-wide hospital service Others should be physically merged with or otherwise organically related to larger institutions The future place and usefulness to the community of each hospital is a matter of public concern It was considerations such as these that caused the Survey to earnestly recommend a central planning board to guide us in shaping our facilities and policies to best meet the needs of the public we were chartered by the state to serve.

At the Crossroads

Indeed, Mr Pyle goes so far as to assert that "our system of voluntary hospitals, viewed in the aggregate and financially speaking, is virtually in liquidation." That is to say

Many of our plants are fast wearing out, becoming obsolete, a third of our building investment, a half of our bed capacity, is in buildings over twenty years old We have made no financial provision through depreciation reserves for the eventual replacement of old buildings but have relied on the hope, once justified by experience but now no longer a certainty, that the amounts necessary for new plants would be given us when required by a generous public Our operating surpluses and spendable funds are depleted so that now we have little more than half the total of eighty million dollars available at the close of 1930 Nearly a half of our separate units have either no operating surplus or an amount so small as to not provide a safe minimum of working capital.

And in the face of all this, it now seems clear that within the next twenty-five years, the hospital system of New York City of which we are a part must replace 24,300, or nearly half, of its present beds, and in addition provide 25,500 new beds in order adequately to serve a population expected to reach a total of 10,800,000 by 1960 To do this, and on a scale more moderate than that demonstrated by several of our recent building projects, will require an investment in land, buildings and equipment of at least $371,000,000, an amount only a little less than our present property investment which approximates $380,000,000 How are we who represent the voluntary hospitals, the most important group from the point of view of service and the establishment of standards—how are

we to finance our share of that prospective investment?

Coupled with the prospect that increased taxes will not soon again permit generous philanthropic support it is clear that these circumstances must soon force cooperative action in our part Our choice is to determine merely how and by whom that action is to be applied.

We may choose to ignore it, to believe that the old order has not yet nor will not soon change, but the fact remains that unless we put our house in order, circumstances perforce will require that government do it for us

Better Times, More Patients

IN THE FIRST SIX MONTHS of 1937, a year with health conditions as excellent as those in 1936, admissions to forty-seven representative and leading voluntary hospitals increased seven percent over the figures for the corresponding months of the preceding year, reports the *Statistical Bulletin of the Metropolitan Life Insurance Company* That this finding is referable essentially to improving economic conditions at that time is borne out by the more detailed analysis of the figures The increase of seven percent in total patients is the resultant of an increase of three percent in ward patients and no less than 12 3 percent in the number of private and semi-private patients

When it is recalled how hard hit financially most of these hospitals were during the depression, how difficult it was for them to meet the demands for ward service, while their earned income from paying patients was seriously curtailed, the chief cause and consequence of the present trend in hospitalization become clear Undoubtedly, the rise in private patients reflects the improvement in business conditions throughout the country in the early part of the year The rise in earned income enabled a larger number of people to pay for private accommodations in hospitals Also a certain number are now taking advantage of their improved economic status to have conditions corrected which, though needing attention, were neglected during the years of the depression

Another probable cause of the increased admission to hospitals, especially in the private and semi-private departments, is the rapid growth of group hospitalization plans during the last few years On January 1, 1933, there was but one nonprofit, free-choice hospital service plan in the United States About 2,000 persons were enrolled in this plan Today, there are thirty-seven such plans in successful operation with an enrollment of 1,000,000 persons

Tb Victims Come to "Life"

A PICTURE STORY FEATURING the Trudeau sanatorium and the Will Rogers Memorial hospital at Saranac Lake occupies a leading position in "Life," the photograph magazine Seven full pages containing twenty-five photographs comprise the Saranac Lake portion of the subject, "Tuberculosis A Menace and a Mystery and $4,500,000 in Christmas Seals"

The story leads with a full-page picture showing a group of nine former stage and movie actors undergoing ultra-violet ray treatment in the Will Rogers Memorial hospital, an institution established for patients of the theatrical profession only

There are pictures of patients on the porch of Trudeau, of others reading in bed, of Charles R. Armstrong, the superintendent of Trudeau sanatorium

Dr Francis R. Trudeau is shown examining a patient. Other pictures are of Dr Edward R Baldwin, the executive committee chairman, researcher and Trudeau family physician, of the round wood stove that heated Dr Trudeau's first, crude little sanatorium, of the little red cottage which Dr Trudeau built in 1884 as the beginning of his institutional work, of the Trudeau X-ray film library with Dr LeRoy Gardner, director, and Dr Arthur Vorwald, assistant director of the sanatorium laboratories, of flasks of imprisoned germs, of a patient undergoing the shot-bag treatment.

Then there is a page of pictures devoted to the surgical phase of tuberculosis treatment They show a patient undergoing hollow needle treatment in the pneumothorax area, a colored patient likewise treated, thoracoplasty or removal of ribs, picture of removed ribs, a full-page shot of the use of the fluoroscope, and finally a page of pictures showing slow-cure patients as well as patients who have fully recovered and gone about the activities of normal life.

Events

RECOGNITION OF NEARLY forty years' service as a trustee of Memorial hospital at Niagara Falls was given Walter McCulloh by fellow-members of the board of trustees at a testimonial dinner in his honor held in the reception room of the hospital nurses' home on November 16

The oldest member of the board, Mr McCulloh has been active in the direction of the hospital's affairs ever since its organization was first planned and was president of the board for nine years, as well as serving in many other capacities

DELEGATIONS FROM ALL organizations instrumental in the founding of Wyckoff Heights Hospital in Brooklyn at the turn of the century, as well as representatives of newer organizations interested in the hospital, joined in celebrating the institution's thirty-eighth anniversary on December 8 at a dinner-dance at the Hotel St George About 1,200 attended. Prominent guests to occupy seats on the dais were Hospitals Commissioner S S Goldwater, Deputy Commissioner Clarence Ford of the State Social Welfare Department, David H McAlpin Pyle, president of the United Hospital Fund, Borough President Ingersoll, Borough President Harvey of Queens, Dr Albert G Cook, chairman of the hospital doctors' dinner committee, Henry Holterman, charter member of the board of trustees, Louis Schenkweiler, superintendent of the hospital, and Herman L Papsdorf, chairman of the dinner committee.

DR. HORACE LOGRASSO, superintendent of J N Adam Memorial hospital, Perrysburg, was eulogized as a "torch bearer for Italian-American physicians" at a dinner in Buffalo on December 2 honoring him for his twenty-five years of service at the Perrysburg institution The dinner was given by the Baccelli club, Italian-American Medical society

THE ANNUAL DANCE FOR the benefit of St James Mercy Hospital of Hornell was held at the Hotel Sherwood in that city on Nov 25

THE NURSES ALUMNAE Association of the Leonard Hospital of Troy gave a dance at the Van Schaick Island Country Club on November 27

A TESTIMONIAL DINNER TO Dr J Hubley Schall, chief consulting surgeon of the Prospect Heights Hospital in Brooklyn, who retired after serving on the staff of the institution for thirty years, was given at the Montauk Club, Brooklyn, by the hospital board on December 8

Newsy Notes

SOME THIRTY CHILDREN forced to pass long months in St. John's Hospital, Brooklyn, because of a heart that flutters too wildly, an operation that just won't heal or some other physical disability will have a chance to keep scholastic pace with their friends in the world outside if the Board of Education adopts a recommendation of the Board of Superintendents

The superintendents have suggested that a substitute teacher, textbooks and supplies be provided to the hospital for instruction of the children in an "opportunity class" Bedridden youngsters will be taught at their own bedside. Those who can move or wheel themselves about in a hospital chair will gather in the solarium to learn their lessons and give recitations

Authorities of the hospital have expressed their desire to cooperate About 100 children in all are in the hospital, but the thirty to whom instruction will be given fall within the school age range of six to fifteen years

Associate Superintendent Margaret J McCooey, in charge of the classes for handicapped children, submitted the report which led to the recommendation of the Board of Superintendents The elementary school division has approved the project

THE SAMARITAN HOSPITAL in Troy has been congratulated by Gov Herbert H Lehman on its installation of an exercising pool for sufferers from infantile paralysis The Governor's letter of commendation was

directed to Miss Grace E. Allison, hospital superintendent. Mr. Lehman said in part:

"I am very glad indeed to know that the board of directors of the Samaritan Hospital have generously provided equipment with which to offer assistance to the unfortunate children suffering from the ravages of poliomyelitis. It is a splendid work and one that is needed in every community of the state."

A GRANT OF $6,000 WAS MADE, to the Lockport City Hospital in December by the Common Council to meet expenses for the balance of the year. The Board of Managers, in a communication to the council, said that a curtailment of revenues, not anticipated when its budget was made up, had resulted from the remodeling of the hospital. "The demand for hospital facilities," said the Board of Managers, "has been unprecedented, but because of lack of rooms due to construction, it has been impossible to obtain the income necessary to meet the current budget requirements."

DR. LIVINGSTON FARRAND, former president of Cornell University, was sworn in as a governor of the Society of the New York Hospital at a meeting of the board in December. Dr. Farrand became the 376th governor elected since the society received its charter from George III in 1771.

WILLIAM CREIGHTON PEET, president of the Board of Trustees of the United Hospital at Port Chester, died at his home in Rye on November 27.

APPROXIMATELY FORTY MEMBERS of the physicians' staff of Troy Hospital enjoyed a turkey dinner in the cafeteria of the hospital on Nov. 11. Dr. F. J. Noonan, president of the staff, was in charge.

The dinner was in celebration of Armistice Day, since a number of the staff are World War veterans, and also to formulate plans for scientific and clinical meetings during the winter months.

DR. EDWARD GILLESPIE RETIRED from the Binghamton State Hospital on Oct. 1 after forty-one years of faithful service.

THE REPORT THAT THE WALLS of the Indianapolis City Hospital have been decorated with paintings for twenty-five years without any bad results moves a Philadelphia editor to remark that this might persuade the medical world to give more thought to relieving white and yellow drabness. The Hoosier institution has found that murals cheer up sick people.

This presupposes, of course, that husky stevedores having crushed toes repaired are not put in the children's rooms enlivened by brownies and fairy tale characters, but the principle seems to the layman worthy of emulation elsewhere. Paintings inframes may collect germs and dust, but murals are at lest washable. A patient might not be a connoisseur, but surely could find more pleasure in gazing, hour after hour, on an appetite-whetting still-life painting of fruits than at immaculate plaster.

Dentists project movies on ceilings to keep children interested. Music has a proven therapeutic value in illness. The Indianapolis Hospital would do a general good turn by collecting testimonials from all its patients who in the past quarter-century have been soothed by wall decorations. The whole idea is convincing, the only danger is that some of the art might be so painfully bad that irritable patients would hurl glasses. Even well people sometimes get that impulse.

At the Helm

THE FOLLOWING HOSPITAL OFFICIALS HAVE BEEN CHOSEN:

Dr. Harry J. Worthing, to be superintendent of the Pilgrim State Hospital at Brentwood.

Mrs. Paul Beck, to be president of the governing board of the Flushing Hospital auxiliaries.

Dr. Johnston MacLeod, to be chief of the medical division of Flushing Hospital.

Mrs. Frederick W. Parmele, to be president of the Guild of St. Luke's Hospital at Newburgh.

Medicolegal

LORENZ J BROSNAN, ESQ
Counsel, Medical Society of the State of New York

Responsibility of Physician for Acts of Special Nurse

Repeatedly lawsuits are instituted against physicians to recover damages for personal injuries brought about by the acts of subordinates who have been relied upon by physicians to carry out the details of the routine care of a patient. An example of such a case where the individual at fault was a special nurse was recently presented before an appellate court in one of the Western States * Plaintiff sought therein to fix responsibility upon a physician for the acts of the nurse in acting under orders of the doctor

It seems that the plaintiff, Mrs L, was a young married woman who had originally consulted the defendant, Dr J, with respect to her pregnancy, and had retained his services to attend her and care for her in connection with her impending delivery In due course she entered a hospital, conducted by a Catholic Order, early on a Sunday morning About eleven o'clock that morning the doctor advised the patient that it would be necessary for him to deliver her by cesarean delivery to which she consented At the same time Dr J told her that she would have to have a trained nurse to which she replied 'All right, Doctor, that is up to you entirely" She was very soon taken to the operating room and the operation performed

When the patient was brought back from the operating room, the special nurse, a Miss S, was on duty, and shortly, acting upon orders from Dr J, administered to Mrs L a rectal injection of glucose solution Dr J was not present in the patient's room when the solution was injected It later developed that the solution, when administered, was too hot, and caused Mrs L to sustain burns

The patient, however, did not become aware of the fact that she was burned until the following Wednesday morning, and it was apparently not until that time that Dr J was informed of that fact. On that day Dr J in examining the patient remarked that she was still running a temperature, and Miss S told him that she thought the temperature was caused by something she had done rather than by the actual condition of the patient Upon questioning by Dr J, the nurse said that she had administered the glucose too hot, and had burned the patient He promptly examined the burned area, and immediately instituted treatments to overcome the condition

After learning of what had happened, the patient discharged Miss S, after first consulting Dr J and obtaining his approval of her letting the nurse go Miss S was paid in full for the time she devoted in the case, although she later refunded the money to Mrs L

Dr J continued to attend the patient and to devote particular attention to the condition caused by the burns This treatment extended in all over a period of nearly five months

Some time later, Mrs L brought an action against Dr J to receive damages for injuries which she claimed she had sustained as a result of his negligence She charged in her pleadings in the case that in treating her in connection with the cesarean delivery that "in so doing he (Dr J) used the services of a trained nurse who was under the directions, control and instructions of the defendant" and that "the nurse in obedience to the instructions and directions of the defendant, negligently administered to plaintiff an injection of glucose solution by injecting same into the bowels of plaintiff through her rectum, and that the said glucose was of such a temperature at the time that it burned plaintiff's flesh, intestines, and internal organs wherever it touched them" It was also claimed that defendant was personally negligent in treating her condition after the burns had been inflicted

Upon the trial the plaintiff herself and her mother testified and gave evidence substantially as in the summary of facts above She also called as a witness a Dr H who testified both with respect to her injuries, and with respect to the treatment she had received He was connected with the hospital in which the plaintiff had been confined and explained the practice with regard to special nurses at the institution

* *Louzader v James*, 107 S W (2nd) 976

According to his testimony, it appeared that the hospital maintained a list of graduate nurses, from which nurses were assigned for duty as special nurses, that Miss S was a graduate nurse and as such had received instructions and training in giving injections of the sort in question, that it was the practice of physicians to rely on nurses in giving such injections, that the nurses carried out the orders written on the chart by the doctors, that the patient paid the special nurse, and that the patient had the right to hire and fire special nurses Dr H, in his testimony, approved the methods used by the defendant in treating Mrs L throughout.

Upon such testimony at the close of the plaintiff's evidence, the trial court granted judgment in favor of the defendant physician An appeal was taken by the plaintiff who contended that a case had been made out for submission to the jury The Appellate Court, however, affirmed the judgment in favor of the physician, and said in the course of its opinion

As suggested by respondent, no complaint is made of the prenatal care or obstetrical services rendered by respondent The complaint revolves around the actions of a graduate nurse, one Miss S, who was employed as a special nurse. The only reasonable inference, as we view it, that can be drawn from the testimony, is that she was employed by the appellant. As to who actually engaged her services, the evidence does not disclose, but appellant states that she paid the special nurse for her services and discharged her It appears from the testimony that the hospital in which appellant was a patient is a private hospital, conducted by the Sisters of Mercy, and appellant knew that. Dr H, appellant's medical witness, testified that none of the doctors in Springfield have any financial interest in B Hospital, that according to the custom and practice at this hospital, a list of graduate nurses is kept and the nurses called in their order off that list for duty as special nurses

Dr H further testified that he knows Miss S, who is a graduate of the B Training School for Nurses, that she had served as special nurse on cases for various doctors in Springfield for some time, and that she had nursed for cases of his at times He testified that the patient pays the special nurse, that the patients have a right to hire and fire the nurse if they wish, and that doctors do not employ the special nurse but that the patient does Certainly, we think the only reasonable inference that can be drawn from the testimony is that Miss S was employed by appellant. The mere fact, if proven, that respondent, when informed of the special nurses available, suggested that a certain nurse be called, or approved of her selection, and later approved when she was released, does not make the nurse respondent's agent, or make him liable for her acts of negligence, under the rule of respondent superior The petition does not charge, and there is no proof that respondent negligently selected, or approved the selection of, an incompetent nurse.

Since this nurse was a graduate nurse of good standing and reputation, experienced and trained in preparing and administering enemas, hypodermics and injecting glucose solution into the bowels, and since administering the glucose solution was routine, and within the scope of her training and duty the same as the taking of temperature, giving hypodermics, or applying dressings to surgical wounds, respondent was not liable for her act of negligence in overheating the solution simply because he was the physician in charge of appellant's case and had authority to direct the nurse to render the service. He was not present when the solution was prepared, neither was he present when it was administered

VENEREAL DISEASE CONFERENCE

The next Saturday morning conference on Venereal Diseases to be conducted at the Health Department building, New York City, by the Bureau of Social Hygiene, will be held on January 8 These are informal conferences, open to all practitioners in New York City, to help clarify difficult points in the diagnosis, treatment, and management of venereal diseases by the general practitioner

All members of the medical profession and medical students are cordially invited to attend Free and open discussions from the floor will be invited.

For reasons of convenience in organization, one main topic will be considered in each session, together with clinical demonstrations wherever possible, and distribution of appropriate literature

The program on January 8 will be devoted to a consideration of the diagnosis and treatment of Congenital Syphilis, including a motion picture film and demonstration of cases

Meetings are held in the Conference Room, on the second floor of the Health Department building, 125 Worth Street, New York City, from 9 30 to 11 30 A M

Dr Howard McGarry has been elected president of the Niagara Falls Medical association, succeeding Dr J H Davidson

Dr McGarry is one of four brothers, all medical practitioners associated in the McGarry clinic

Across the Desk

Man Headed Back for the Jungle?

REASSURING NEWS WAS BROUGHT to New York the other evening by Dr Earnest Albert Hooton, Professor of Anthropology at Harvard, who sees the human race reverting to the status of apes In some ways this may be a fine thing Dr Hooton seems to regard it as a misfortune, but it is possible that he may not be looking at it from every angle He was speaking at the annual dinner of the American Society of Mechanical Engineers at the Hotel Astor, and the newspaper headline over the report in next morning's paper was, "Hooton Finds Man Reverting to Ape"

Well, it must be said, as we glance around the world, that apes would never be guilty of a lot of things that now stain the news crimson every day We sometimes speak of "the law of the jungle," but one law is that the jungle-folk do not attack their own kind. Only humans do that If we were all turned into apes tomorrow, the savagery that is desolating some of the fairest spots on earth and butchering innocent men, women, and children, would stop as if by magic No one ever wrote "Apes' inhumanity to apes makes countless thousands mourn" Only man has got a scorching line like that

Man Maybe Just an Experiment

The anthropologists tell us that man is quite a newcomer on the globe Things were going fairly well before we came Whether we view the evolution of life here as a divine creation or the work of blind chance and natural selection, it is fascinating to see all the experiments that were tried and discarded before the odd concatenation of physical and mental quirks came along that we call man All kinds of tails were tried, some to brush off the flies, some for hanging from trees, some merely to lash in excitement, some seemingly for nothing at all, and finally the appendage was omitted when man was made. Ears were all shapes and sizes And so on The question is—is man so made, fitted, and put together as to hold his place at the very crown and summit of creation? Or will he revert to the ape, and frisk and chatter in the treetops?

For it is quite possible that evolution—or the divine will—is not through yet Under either creed a thousand years are as one day, and along with all the other experiments which we may look at and feed peanuts to at the zoo, we may be here just on trial The few thousand years of our civilization bulk no bigger than last Tuesday in the great calendar of time, and if man cracks and goes to pieces under the strain of his own civilization, we may turn out to be only a passing phase on this green world, and sometime the moon may look down and find us no longer here

Machines Making Monkeys of Us

Dr Hooton thinks that it is our marvelous machines that are making monkeys of us As reported in the press, he emphasized the "apish" behavior of the twentieth-century man, a "once erectly striding biped," who "abandons human locomotion and whizzes through the landscape, crouched over wheels and levers worked by his still prehensile hands and his flat, vestigial feet, no less useful for this purpose than those of his simian ancestors," and who breathes a mixture of gasoline fumes and carbon monoxide and reeks of evolutionary decay"

In a word "machines get better and better, while man gets worse and worse" Machines do everything, so that even a moron can survive in comfort "on a level of adequate nutrition and comparative idleness which would have been unimaginable for the primitive being, even if he were at once a mental genius and a Hercules" It is a disturbing picture that Dr Hooton holds up for us to look at

A premium is put upon illiteracy by the radio and talking moving picture. These mechanical marvels are the means of world-wide spread of vulgarity, depravity and misinformation, since they pander to the tastes of those who are capable neither of contriving nor understanding but only of crude sensory perception, stimulated by turning a switch or pressing a button—motor performances within the capacity of a lemur

Man made himself out of the ape, partly by becoming an engineer The danger now is that the process will be reversed and the engineers will make apes of all of us

If he can make machines which are better than himself, cannot he make himself better? We do not need more automobiles, we need fewer fools in the driving seats, we do not want mechanical robots, we want human animals who still have brains, not more jails, but fewer criminals, not perfected weapons of war, but peace.

Doubts about our Sanity

An explanation of the strange doings going on around the world is found by some shrewd thinkers in the hypothesis that the race is going "balmy," a slang expression meaning cracked, or dotty No less an authority than Dr Ray Lyman Wilbur said in a public address at Syracuse the other day that "in some ways many of the people of practically all of the nations of the earth seem to be a little crazy at present" Millions, he added, "keep themselves under the partial influence of caffeine, alcohol, nicotine, aspirin, and other drugs a good deal of the time" Perhaps that fact and the strain and excitement of our day explain why human nerves are going ragged. Cold figures show that the population of the mental hospitals is rising rising, rising, year after year, with "waiting lists," like fashionable clubs, of people for whom there is no accommodation A popular novelist describes the mood of today as a hunt for sensation We must get a "kick" out of life at any cost Hence the resort to stimulants, drugs, high-speed cars, amorous adventures, anything for a thrill That way madness lies

Insanity is of various kinds, sometimes undiscovered for years, so that it is entirely possible that some of the criminal insane, some of the homicidal maniacs, have attained high places of influence and command, and are calling the turns in the dances of death now cursing lands that otherwise would be peaceful, happy, and prosperous We are "heirs of all the ages," it is true, but some of them were dark ages, savage ages, cruel and bloody ages Our so-called civilization is something very recent, a thin veneer, and underneath it the human breast is filled with a hundred inherited savage and wild impulses, ready to break loose and wreak havoc

Our Rulers, the "Glandocracy"

Then there are the glands Don't forget the glands They are quite the rage now, and if anyone is a bit out of kilter, if his works fail to click, the specialist pounces on his glands In fact, our life is governed by a "glandocracy," says a distinguished authority, with the glands of secretion as the supreme rulers, exerting control not only over the functioning of the individual from conception to death, but also over the relations of men to each other So we are assured by Dr Charles R Stockard, Professor of Anatomy at Cornell University Medical College, in a lecture at the New York Academy of Medicine

In Dr Stockard's glandocracy, according to reports of his address, chemical messengers, or hormones, are sent out by the various glands to distant parts of the body by means of the blood-stream to keep the body going as a functioning, integrated whole, biologically as well as psychologically

These chemical "glandocrats" determine not only the purely physiological functions of the organism but also have the first and last word in the make-up of the personality, in the relationship between the sexes and between small and large groups of individuals

Recent experiments show, Dr Stockard said, that even such emotions as mother love, with its supreme significance to the preservation of species, is dependent on the action of one of these "glandocrats," a chemical messenger known as prolactin, sent out by the pituitary gland located at the base of the skull Other experiments with the endocrine glands show their "great general importance to society as influencing the instinctive behavior of man" He went on

> From a survey of their activities, it is realized that the endocrine glands occupy the position of high command in coordinating the functions and behaviors of all our bodily organs and tissues. They influence in a most profound way our instinctive nervous reactions They bring about that harmonious balance which we think of as the joy and vigor of perfect health, and they are an important part of the material basis for human temperament and the temperamental foundations of personality
>
> Very gradual shifts in influence among the members of this high command are responsible for the constitutional and personality changes during the different periods of our lives, and

more pronounced disagreements and violent disruptions among the members of this glandular oligarchy produce serious and weird diseases of growth, metabolism and nervous and mental functions.

A society is as good or as bad as its nervous system and its glands Therefore, Dr Stockard declared, "these integrating mechanisms are of deep concern not only to neurologists and general physicians but also to sociologists, political economists and all of us

Chemical Millennium Glimpsed

The speaker did not go on to tell us how to apply all this in a practical way to civilize civilization and make humanity humane He did not go so far as the writer some years ago who suggested that peacemakers should soar above battlefields in airplanes, drop bombs of laughing-gas, and cause the hostilities to break up in a burst of merriment But scientists in the audience did not hesitate to add the logical and inspiring corollary of a chemical millennium

"If a way could only be found," a scientist was overheard to remark, "to persuade some of the apostles of hate now in high positions to submit to a few injections of prolactin we may bring about peace on earth and good-will toward men"

Books

Synopsis of Genitourinary Diseases By Austin I Dodson, M D Second edition Duodecimo of 294 pages, illustrated St Louis, The C V Mosby Company, 1937 Cloth, $3 00

REVIEWED

Synopsis of Gynecology Based on the Textbook "Diseases of Women." By Harry S Crossen M D and Robert J Crossen, M D Second edition Duodecimo of 247 pages, illustrated St Louis, The C V Mosby Co, 1937 Cloth, $3 00

This is a pocket outline for students, not a textbook The bare essentials of gynecology are set down in compact form for ready reference. The general practitioner may find it helpful for the quickest kind of reference, as it has merit in its simplicity and extraordinary brevity

CHARLES A GORDON

A Textbook of Applied Biochemistry for Pharmacists and Pharmaceutical Students By Frank Wokes, B Sc. Octavo of 522 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $5 00

The author is a member of the Staff of the Pharmacological Laboratories, College of the Pharmaceutical Society of Great Britain The book is the product of a course of lectures which the author delivered before the Pharmaceutical Society in London, and is an excellent elementary textbook on biochemistry Besides describing various aspects of physical chemistry,

ORDERING BOOKS

As a service exclusive to our readers, books published in this country may be ordered through the Business and Editorial Offices of the Journal (33 W 42nd St N Y C.) postage prepaid Order must be accompanied by remittance covering published price.

such as hydrogen ion concentration, surface phenomena, colloids and spectroscopy, he also deals with metabolism, nutrition, enzymes, hormones and vitamins The book stresses the chemistry of glucocides and alkaloids, and deals with the pharmacology or organ and plant derivatives

Although written for the student of pharmacy, it contains material of practical interest to the physician, as there is much that he can get from it to help in his therapeutic practices

WILLIAM S COLLENS

Heart Failure By Arthur M Fishberg, M D Octavo of 788 pages, illustrated. Philadelphia, Lea & Febiger, 1937 Cloth, $8 50

Those who are familiar with the volume on *Hypertension and Nephritis* will recognize immediately the similarity of style and systematic approach adopted in this latest book by Fishberg Devoting the first part of the work to individual symptoms and signs of circulatory failure, the second to clinical syndromes and the third to treatment, the author surveys a vast amount of well digested literature, carefully appraised and soberly assessed The book is full of helpful and valuable information There is a good chapter on the central nervous system, manifestations associated with circulatory failure, a much neglected topic The section on cardiac enlargement includes Kirch's interesting studies on the inflow and outflow tracts, as well as some useful information on radiography The murmur of Austin Flint, in Fishberg's experience, may be associated with an apical thrill, a statement with which many clinicians would take issue

A welcome chapter discusses fully the physiological and clinical aspects of peripheral circulatory failure, stressing particularly the crying need of distinguishing this type of collapse from central failure.

It is difficult to give this book anything but high praise Without question, it is a work that no physician can afford to ignore

ANDREW M BABEY

International Clinics A Quarterly of Illustrated Clinical Lectures and Especially Prepared Original Articles on Treatment, Medicine, Surgery, Neurology, etc Edited by Louis Hamman, M D Volume II, Forty-Seventh Series, 1937 Octavo of 315 pages, illustrated Philadelphia, J B Lippincott Company, 1937 Cloth, $3 00

As usual this issue of *International Clinics* contains many useful clinical monographs, and several of extraordinary excellence Outstanding are Burwell's article on *Asymptomatic Heart Disease* and Denman's paper on *Subacute Bacterial Endocarditis*

Among valuable features of these publications are the reviews of progress in various fields of medicine Both physicians and surgeons will find Gray and Mackenzie's review of *Progress in the Surgery of the Biliary Tract* an intelligent survey of an important field

MILTON PLOTZ

Childbirth Yesterday and Today The Study of Childbirth Through the Ages, to the Present By A. J Rongy, M D Duodecimo of 192 pages, illustrated. New York, Emerson Books, Inc, 1937 Cloth, $2 00

In this small book, the author, who is a specialist in obstetrics and gynecology, has depicted childbirth from the early ages down to the present. He has written a most interesting story of the many religious beliefs in regard to the parturient woman, and tells us much of the various techniques used in different countries and in different ages to deliver the woman in labor

The chapters on the Midwife, History of Child Care, and the Superstitions, are fascinating reading

In conclusion, the reader is brought down to the present time, and is given chapters on Birth Control, Childbirth Today, and Maternal Mortality

The author's theme is that women themselves must exert their individual and collective strength in order to relieve motherhood of some of the remaining fears and dangers

WILLIAM SIDNEY SMITH

Synopsis of Digestive Diseases. By John L. Kantor, M D Duodecimo of 302 pages, illustrated. St. Louis, The C V Mosby Company, 1937 Cloth, $3 50

The book adequately fills a long-felt want. The drawings used in illustration are excellent and clearly portraying

In the chapter on "Organic Constitutional Inferiority," one notes the difficulty of separating the "normal" from the "average," since sthenic, intermediate and asthenic are necessarily "normal" and the ptotic individual is not made ill because of his ptosis, as the latter remains long after the symptoms have disappeared.

The end of the book, comprising only eight pages designated Part IV, "Digestive Symptoms of Extra Digestive Diseases," is skimmed over all too briefly in a book whose value should be greatest to the general practitioner

In general, however, one may say "Well-Done"

FOR YOUR SKIN'S SAKE AND FOR YOUR PATIENTS' TOO

Ask About Our Professional Courtesy Offer On

PACKARD LEKTRO-SHAVER

YOUR PACKARD LEKTRO-SHAVER WITH YOUR SIGNATURE ENGRAVED ON THE HANDLE IN YOUR OWN WRITING

The ad to the right records an *amazing* preference for the Packard among your associates We doubt if any shaving device could say the same —*that six times as many have been bought by doctors as by any other occupational or professional group*

You should own a Packard Because it will give you the kind of skin-gentling, clean-shaving, time-saving, bother-free action you need in your crowded life And because it's just the thing to recommend to skin patients. One shave with your Packard will tell you why it's the perfect shaving instrument for men with acne, psoriasis, moles, pimples, etc

(P S Ordinary blade shaving causes even normal skin to become thick with superficial scar tissue—gives it an "aged" look Packard Lektro-Shaver's feather-light touch ends this The skin freshens—you look years younger Ask about our Professional Discount Offer)

Ask your Doctor

What you call shaving is "Pogonot omy to the doctor Physicians ap proach this business of daily dewhisk ering as a scientific *problem* And what is their verdict? Judge for yourself—our sales show that

SIX TIMES AS MANY PHYSICIANS

use Packard Lektro-Shavers as the next nearest occupational group. This is because doctors have found that only Packard Lektro-Shaver shears instead of clips and that its exclusive, smooth round head gives a feather-light, satin smooth shave every time —without blades, brush or bother

They have told one another how *safe* Packard is—how its round head rolls over skin eruptions, blemishes, etc , getting every whisker, but never cutting nicking or scraping Doctors often have to shave between calls; time is important to them—and Packard Lektro-Shaver *never* slows them up or lets them down. On things like this doctors know best. They re critical, analytical. And they ve chosen Packard How about you? **$15** every where.

CANNED FOODS IN THE CONTROL OF LATENT AVITAMINOSIS B_1

• Apparently mild vitamin B_1 deficiency in humans is not characterized by very definite or entirely specific symptoms While such a condition may be attended by anorexia, hypotonicity of the bowel, indigestion, vague pains and malaise, latent avitaminosis B_1 hardly presents a picture which is favorable to its early clinical detection However, there are two procedures which may be employed when this type of avitaminosis is suspected

The first procedure (1a) depends upon the nature of the response to administration of pure vitamin B_1 The second procedure, which has been more widely applied, makes use of the Cowgill formula for calculation of vitamin B_1 requirement. By consideration of the actual vitamin B_1 intake and the calculated vitamin B_1 requirement in any specific instance, the probability of mild avitaminosis B_1 may be evaluated (1b)

It is difficult to estimate the frequency of mild vitamin B_1 deficiencies in the United States. However, until such information is at hand, it is not illogical to suggest that latent avitaminosis B_1 must be regarded as an active possibility in some cases which may come to the attention of the medical practitioner Fortunately, several factors are operative which give assurance that eventually the incidence of latent avitaminosis B_1 will be reduced to a minimum.

First, those concerned with human nutrition have today more definite information concerning quantitative human vitamin requirements than ever before in history (2)

Second, every passing year brings marked progress in education of the layman to the necessity of a completely "protective" diet The control of the latent avitaminoses is, in large part, dependent upon proper food selection and correct formulation of the diet by the layman consumer

In the establishment of dietary regimes which will be protective against vitamin deficiencies, commercially canned foods may play an important part Several hundred canned foods are available upon the American market at all seasons of the year Nutritional research has shown (3) that modern canned foods retain in good degree the vitamin B_1 contents of the raw materials from which they were prepared This great class of foods—available to all consumers regardless of economic status—will contribute substantially to the alleviation and prevention of latent avitaminosis B_1 in this country

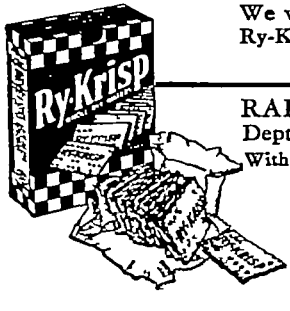
ACCEPTED AMERICAN MEDICAL ASSN Council on Foods

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Council on Foods of the American Medical Association

WE'RE SORRY TO SAY "NO"

Almost every mail brings a request for a specific Allergy Diet Sheet from some individual who has learned how helpful they can be to persons sensitive to wheat, milk, eggs or a combination of all three. We're sorry to say "no", but these sheets were prepared, in cooperation with recognized authorities, for professional distribution only.



On these Allergy Diet Sheets, planned to help both the physician *and* patient, are clearly and simply listed exactly which foods may be eaten and which avoided according to the patient's particular sensitivity On the reverse side are safe and appetizing recipes. Each sheet also provides space for personal instructions and the physician's signature No advertising appears on them

RY-KRISP
Whole Rye Wafers

Safe and Delicious for Patients Sensitive to Wheat, Milk or Eggs.

Naturally Ry-Krisp is included prominently among the allowed foods—for these crunchy, richly flavored wafers, so simply made of whole rye, salt and water, are both perfectly safe and perfectly delicious. In fact, they actually encourage the patient to adhere more closely to the necessary diet—because they taste so good with other foods at every meal

We will gladly send you copies of these sheets and samples of Ry-Krisp Whole Rye Wafers Simply use the coupon

RALSTON PURINA COMPANY

Hospitals and Sanitariums

INSTITUTIONS SPECIALIZING IN TREATMENTS

An Exceptional Institution

Thirty-seven years ago, the interest of Mrs James Edward Newcomb in the plight of so many young women with tuberculosis, resulted in the founding of one of the country's most unusual private institutions for the care and treatment of such cases

With the aid of groups of women forming its auxiliaries and directorate, Stony Wold In The Adirondacks has grown with the years and extended its service to the medical profession with greater facilities and experience for treating cases in this branch of medicine The facilities of Stony Wold, including opportunities for thoracic surgery, are offered to such young women with tuberculosis who have been certified as suitable by its medical examiners Early, moderately or far-advanced cases, with favorable prognosis are acceptable No discrimination is made in nationality or creed

Auxiliary groups, though not exceptional with Stony Wold, are unusual in themselves Twelve groups form this helpful side of th institution, each headed by a chairman, an yearly they raise about $30,000 which finance patients assigned to them or selected by ther The institution assumes the care of some case without money being in sight Patients with out adequate funds are thus enabled to re ceive the full benefits of Stony Wold at a mo nominal weekly charge

Space does not permit adequate descriptio of the usefulness and capacity for handlin these problems which make this institutio so valuable in its field, and every physicia is urged to write for the very interesting an informative booklet describing Stony Wol in full A file copy will be found worthwhil for reference Address inquiries to Dr Har vey B Powers, Superintendent of Stony Wold Lake Kushaqua, N Y, or to Miss Lillia O Amelung, Executive Secretary of Ston Wold, 598 Madison Avenue, New York City

STONY WOLD SANATORIUM

NOTES FROM OUR ADVERTISERS

The Gomco Surgical Mfg Corp

Announces a Great Advance in Pump Design

All Gomco Rotary Pumps are now equipped, at no additional cost, with an improved oiling system whereby oiling is required only once in every twenty-five (25) running hours—equal to six to twelve months average use

An exclusive Gomco improvement of over 600% in oiling efficiency—(registration applied for)

Pumps already in use can have this feature added at slight additional cost Write for details giving pump *serial* number

All Gomco No 710 and No 712 Rotary Pumps are now supplied as standard equipment with 32 oz vacuum and 16 oz ether bottles and improved hold down attachment This arrangement plus the auxiliary filter we are now placing in the vacuum bottle greatly lessen the danger of aspirating debris into the pump

* * *

Use of "Benzedrine Inhaler" for Children

Vollmer (Arch Otolaryng , 26 91, July, 1937) treated with "Benzedrine Inhaler" a series of 75 children exhibiting rhinological symptoms due to infection or allergy The ages varied from one to twelve years

No difficulty of administration was encountered with either the infants or the older children Clinical observation made fifteen minutes after use of the Inhaler showed marked shrinkage of the nasal mucosa resulting in decongestion of the nasal passages and relief from "stuffiness" All the cases of acute rhinopharyngitis and sinusitis were benefited Those with otitis media received relief from nasal symptoms although it did not alter the course of the disease This was also true of two cases of asthma No results were obtained with two cases of epistaxis

In no case were any ill effects noted, such as headache, sleeplessness, restlessness or gastro-intestinal disturbance It is thus concluded that 'Benzedrine Inhaler" can be satisfactorily employed with young children for the relief of nasal symptoms due to infectious or allergic edema

NOTES FROM OUR ADVERTISERS

(*Continued from page xxxiv*)

Vitamin B_1 Therapy in Neurologic Diseases

Both on the experimental side and the clinical side it has been repeatedly shown that vitamin B deficiency leads to severe derangements of the central and peripheral nervous systems, and evidence is rapidly accumulating that such deficiency may be of subclinical grade and cause considerable disability without being recognized Just what the nature of the bio-chemical changes induced in nervous tissue by vitamin B is, is not clear, although a derangement of glucose metabolism appears to be involved

'Betalin 1' (Vitamin B_1, Lilly) Pulvules have been found effective in the treatment of alcoholic polyneuritis and other forms of deficiency of this vitamin They provide for an economical administration of vitamin B_1 to supplement dietary management and are frequently indicated where it is impossible for the patient to assimilate the necessary quantities of this accessory food substance

Erratum

Correcting an error in the advertisement of the Cheplin Biological Laboratories, Inc, advertisement of Dec 15th, in the paragraph "Supplied" under Potassium Bismutho-Tartrate, "35% metallic bismuth" should have been "66% metallic bismuth" which explains correctly the higher bismuth metallic content in Potassium Bismutho-Tartrate (Cheplin) in contrast to Sodium Bismutho-Tartrate (Cheplin)

Potassium Bismutho-Tartrate (Cheplin) is also available in vials of 60 cc (2 fl oz) in addition to ampules of 2 cc

Travel and Resorts

Bon Voyage

In two weeks, the cruise of the Pan American Medical Association will be under way We wish them a pleasant, successful congress afloat.

While accommodations have been going fast, there is still room, and time for reservations for a few more physicians in good standing

There is no need to stress the value of this cruise from a scientific standpoint, nor to dwell further on the social activities and interest included in the trip Any physician who can get away from his practice should make the cruise for it will provide much worthwhile contact with outstanding colleagues of the profession as well as an instructive and enjoyable time that will hold a lifetime of memories

For further particulars and last minute reservations, address Dr Joseph Jordan Eller, 745 Fifth Avenue, N Y City, or Travelways, Inc, 542 Fifth Avenue, N Y City, immediately

American Medical Golfing Association Tour

A recent announcement by Dr Walt P Conway, president of the American Medical Golfing Association, revealed that special arrangements are being made for members going to the San Francisco meeting next June

This plan which received the approval of past presidents of the association, present officers, and many members who were consulted, covers accommodations for a golfing tour en route, special steamer, and special trains

At New Orleans there is to be 18 holes of golf, an official tour of the city and a dinner At Houston, Texas, there will be nine holes of golf at the country club and sightseeing At Galveston, another nine holes, sightseeing and afternoon tea for the ladies At San Antonio, there is to be 18 holes of golf at the country club, luncheon, and a tour of the famous Alamo and ancient Missions At Los Angeles, breakfast at the Biltmore, a trip around the city, including Hollywood and Beverly Hills Luncheon at the Universal Studio Inn, afternoon tea at Warner Bros Studios, and dinner at the Biltmore

At Del Monte, California, there will be breakfast and Sunday noon dinner at the Hotel Del Monte, golfing at the famous Pebble Beach Course, and swimming at the Seventeen-Mile-Drive.

Bill Burns, Executive Secretary, will have complete charge of golfing activities which assures several properly-conducted tournaments There will be golf prizes, bridge prizes and special favors for the ladies There will be an escort with the party, no travel worries, and no extras Price of trip includes all necessary expenses

For fuller details and reservation blank address Walt P Conway, M D, President American Medical Golfing Association, 1723 Pacific Avenue, Atlantic City, N J

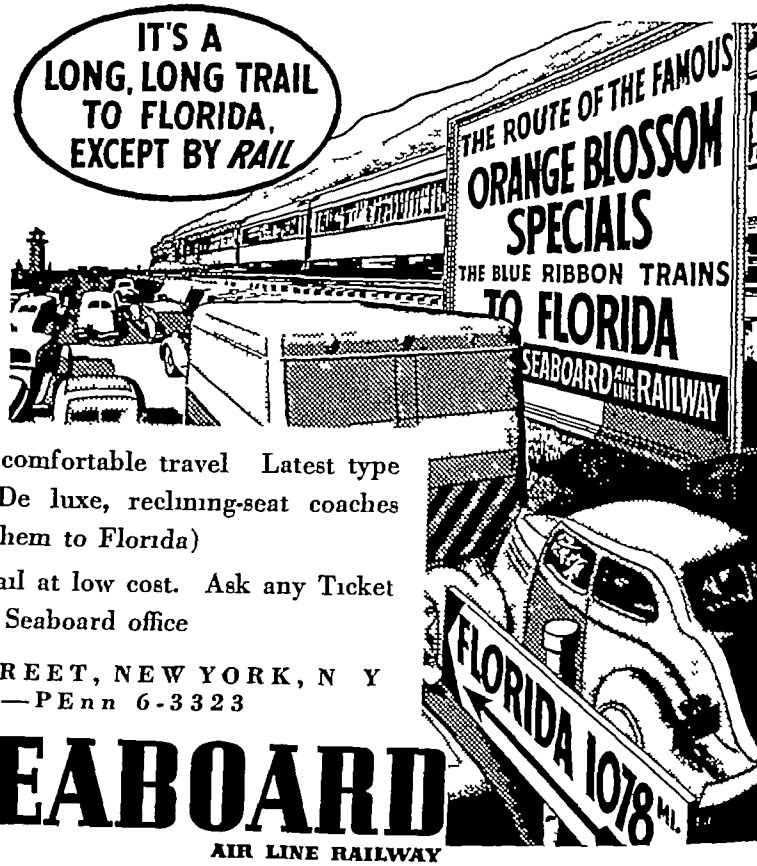
Clubhouse Completed at New Bermuda Beach

Bermuda pink sand, a clubhouse overlooking the broad Atlantic, luncheon and tea service, and commodious locker-rooms for men and women, with complete shower equipment, combine to make the recently-opened Belmont-Inverurie Beach Club on the south shore a favorite rendezvous for members of the winter colony from these hotels



The new club is on Simmons Bay, only ten minutes from either Belmont Manor or Inverurie by bus (horse-drawn, for this is Bermuda) Featuring the clubhouse is a large lounge, Chinese in its decorations and furnishings The front is a huge sheet of plate glass giving an unobstructed view of the ocean

An old Bermuda fireplace, which was in the original building, adds a homelike touch New gardens will be developed during the winter Two hundred and fifty palm trees are being brought up from the West Indies to add to the existing tropical background

Of course the clubhouse is coral pink, as one would expect in Bermuda. It stands at the edge of a cliff, with an easy approach to the beach

AIR LINE RAILWAY

Retrospect

With less than a month remaining, the year 1937 already has proved itself the greatest in the history of American Airlines, Inc, while the outlook for 1938 is even brighter, according to C R Smith, president of the company

In a statement issued today, Smith said the total of 283,485 passengers transported by American Airlines in the first eleven months of the present year already represents a substantial gain over the 255,324 total for all of 1936 while the December figure undoubtedly will place the total well above the 300,000 passenger mark for the first time in the history of any air lines

Even more impressive, he said, has been American's gain in passenger miles which, in ten months, exceeded the total for the entire year of 1936 The record of 106,349,229 passenger miles from January through October 1937 exceeds the total business that any air line in the world has done in an entire calendar year, and compares with the previous total of 100,637,461 passenger miles reported by American for the entire year 1936

A study of the passenger and passenger mile figures also shows, Smith pointed out an increase of from approximately 374, to 407 miles as the average length of flight per passenger By direct comparison of ten month figures for the two years, revenue passenger miles show an increase of 36 7 per cent for 1937 over the preceding twelve months This is substantially due to the increased patronage of Flagship Skysleeper service on the Southern Transcontinental route

Smith indicated 1938 plans for American Airlines, Inc, were being laid on an expectancy of approximately 400,000 passengers,

S.M.S. MEDICAL COLLEGE,
LIBRARY, JAIPUR.

this estimate having been reached after a study of air line trends during the past three years, together with known improvements in service which will be available during the year

"Principle advancements in service will be made possible through completion of airport and passenger terminal facilities in several major cities throughout the United States," Smith said. "Many of these projects, notably in Memphis, Nashville, Rochester, Cleveland, Ft. Worth, Knoxville and Bristol, have been already completed during the last few months while others will be ready for use early in the year

"Another contributing factor will be completion of American Airlines' long term re-equipment program which has resulted in adoption of Douglas Club and Skysleeper Flagships and 14-passenger planes as standard equipment on all the through routes American Airlines today is the largest operator of Douglas planes in the world and will be in position to render the most efficient service in its history throughout the entire year

"Probably the most important point in the development of air travel in the United States," Smith concluded, "is the growing acceptance of air transportation as a vitally necessary tool for modern business, a recognition of the fact that air service has a definite value in dollars and cents to the business man whose markets are broad and whose time is limited. This growing acceptance has become the backbone of our industry"

* * *

To Bermuda!

"Of your blue water and Old World houses and great golf courses, we do talk, but our conversation invariably begins with 'Why don't you go to Bermuda? Think of it! You can entirely escape from motors—you can actually ride in a carriage!' Always the answer is, 'Wonderful! I would like to get away from the stench and racket of automobiles again I hate 'em! Let's go!'

"On this my second stay here, I find myself loving the island more than ever, and I hope that there may be some value in my testimony as to what it is that most attracts those American tourists whom, you yourselves say, you wish to bring here in larger numbers

"Primarily they are attracted precisely by the fact that Bermuda is different from their own neighborhoods"—*Sinclair Lewis*

Doctors Know This!

Sea air is good for convalescents. With plenty of rest and good food, health is quickly built back. Your patients receive special care at the Half Moon, New York City's only ocean front hotel. STRAPPED FOR RICKETS

A bambino from the Foundling Hospital Florence Italy,—A. della Robbia

The swaddled infant pictured at right is one of the famous works in terra cotta exquisitely modeled by the fifteenth century Italian sculptor, Andrea della Robbia. In that day infants were bandaged from birth to preserve the symmetry of their bodies, but still the gibbous spine and distorted limbs of severe rickets often made their appearance.

SWADDLING was practised down through the centuries, from Biblical times to Glisson's day, in the vain hope that it would prevent the deformities of rickets Even in sunny Italy swaddling was a prevailing custom, recommended by that early pediatrician, Soranus of Ephesus, who discoursed on "Why the Majority of Roman Children are Distorted"

"This is observed to happen more in the neighborhood of Rome than in other places," he wrote "If no one oversees the infant's movements, his limbs do in the generality of cases become twisted Hence, when he first begins to sit he must be propped by swathings of bandages " Hundreds of years later swaddling was still prevalent in Italy, as attested by the sculptures of the della Robbias and their contemporaries For infants who were strong Glisson suggested placing "Leaden Shooes" on their feet and suspending them with swaddling bands in mid-air

How amazed the ancients would have been to know that bones can be helped to grow straight simply by internal administration of a few drops of Oleum Percomorphum What to them would have been a miracle has become a commonplace of science Because it can be administered in drop dosage, Oleum Percomorphum is especially suitable for young and premature infants, who are most susceptible to rickets Its vitamins A and D derived from natural sources, this product has 100 times the potency of cod liver oil * Important also to your patients, Oleum Percomorphum is an an economical antirickетic.

Oleum Percomorphum offers not less than 60,000 U S P vitamin A units and 8,500 U S P. vitamin D units per gram. Supplied in 10 and 50 c.c. bottles, also in boxes of 25 and 100 ten-drop soluble gelatin capsules containing not less than 13,300 vitamin A units and 1,850 vitamin D units (equal to more than 5 teaspoonfuls of cod liver oil*)

NEO-SYNEPHRIN

HYDROCHLORIDE

(laevo alpha-hydroxy-beta-methyl-amino-3-hydroxy ethylbenzene hydrochloride)

No doubt the first thought of the patient who is suffering from nasal congestion due to the common cold, rhinitis, or other upper respiratory tract infection, is 'How can I obtain relief from this 'stuffed-up' condition and be enabled to breathe freely?"

You can not only provide the desired symptomatic relief quickly, but you can assure a prolonged decongestive effect by the topical application of the synthetic vaso-constrictor, Neo-Synephrin Hydrochloride

Whether you apply Neo-Synephrin by dropper, spray, jelly or applicator, you will find that all forms are without sting, that they not only give a more sustained action, but are better tolerated than either epinephrine or ephedrine, and that in the dosage recommended, they do not usually produce "nervousness" or insomnia

Neo-Synephrin can be used equally well for *either adults or children* in these convenient forms—

EMULSION
¼% (1 oz bottle with dropper)

SOLUTION
¼% for dropper or spray
1% for resistant cases
(1 oz bottles)

JELLY
½% (in collapsible tubes with applicator)

NOTE For Acute Hypotension due to shock or anesthesia especially spinal the subcutaneous administration of Neo Synephrin Hydrochloride has been found of established merit [1, 2]. For this purpose Neo-Synephrin is supplied in rubber-capped vials containing 15-cc of a sterile 1% solution

1 Johnson C A A Study of Neo-Synephrin Hydrochloride in the Treatment of Acute Shock from Trauma or Hemorrhage Surg Gynec and Obst 63 35 (July) 1936

2 Johnson C A Neo Synephrin Hydrochloride in the Treatment of Hypotension and Shock from Trauma or Hemorrhage Surg Gynec. and Obst 65 458 (Oct) 1937

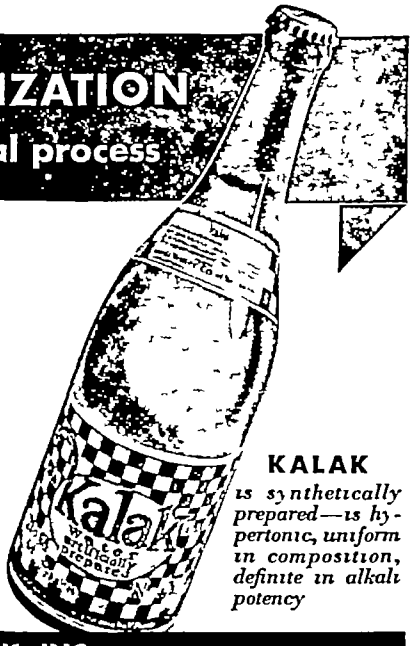
Theocalcin

COUNCIL ACCEPTED



More Comfort for the Cardiac Patient

Prescribe Theocalcin 1 to 3 tablets t. i d, to diminish dyspnoea, reduce edema and bring comfort to your cardiac patients Theocalcin is a well tolerated diuretic and myocardial stimulant.

Theocalcin (theobromine-calcium salicylate) is available in 7½ grain tablets and as a powder
Theocalcin Trade Mark reg U S Pat. Off

BILHUBER-KNOLL CORP., 154 Ogden Ave., JERSEY CITY, N. J.

BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy

KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

VITAMINS *and* TASTE

One of the reasons why so many physicians prescribe vitamins A and D in the form of MALTINE WITH COD LIVER OIL *is* that this preparation has none of the unpleasant oily consistency and taste usually associated with vitamin-bearing oils. Patients — even small children — enjoy it. Furthermore, the vitamin-A efficiency of cod liver oil is actually *enhanced twofold* when emulsified with Maltine, as has been proved by carefully checked laboratory experiments In addition to the vitamins of cod liver oil, this preparation also contains the valuable factors of Maltine.

Another preparation, MALTINE WITH COD LIVER OIL and IRON IODIDE, is also available, with a concentration of two grains of freshly prepared iron iodide per fluid ounce .. The Maltine Company, 60 Hudson Street, New York City.

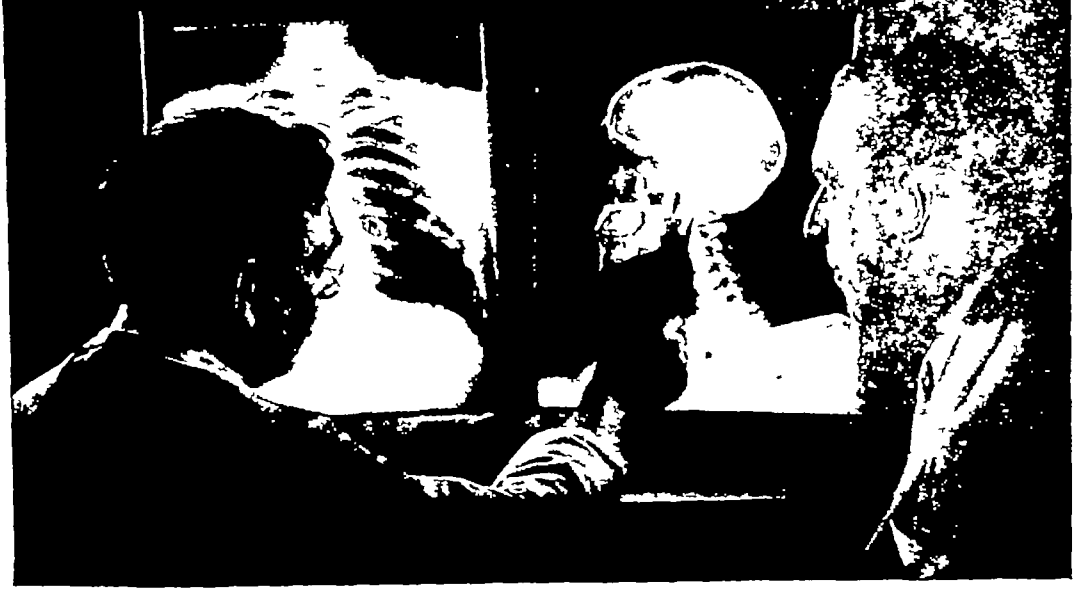
FOOLING ASIDE—the cows who give milk for Borden's must have what it takes Their health is double-guarded by a busy corps of veterinarians and farm inspectors Their milk output is carefully watched for freshness and cleanliness

Little details like these account for the reliable and uniform food values in every can of Borden's Irradiated Evaporated Milk



Doctors write "BORDEN'S"

on formulas calling for evaporated milk when they want to make sure mothers will use a brand whose standards they approve Borden's Evaporated Milk was accepted in 1930 by the American Medical Association Committee on Foods.

If you are not familiar with the brand name under which Borden's Evaporated Milk is sold in your locality, write The Borden Company, 350 Madison Avenue, New York City, for particulars

HOW DO YOU GET SUCH FINE RADIOGRAPHS?

THIS frequent inquiry, enthusiastic users of the Model R-36 Diagnostic X-Ray Unit tell us, is another source of continual satisfaction

Owners are producing uniformly good diagnostic radiographs because this practically designed unit is simple and easy to operate—accurately

Here's a unit that packs real power—chest radiographs, for example, with $^1/_{10}$th- and $^1/_{20}$th-second exposures at 6 feet distance With two focal spots in the radiographic tube, you select the one best suited to technic and area of the body under observation

Fluoroscopy too—from head to toe—at any angle, with a separate tube and high voltage circuit, operated through the same control unit.

Shockproof, self-contained, compact, of the finest electrical and mechanical construction, the R-36 is a sound, economical investment for the physician who is forging ahead, determined to give all his patients the full benefits of modern diagnostic facilities

BECAUSE of dietary whims, the pregnant woman and the growing child often fail to obtain sufficient calcium to meet their requirements

For this reason many physicians are prescribing Dicalcium Phosphate Compound with Viosterol Squibb This product not only provides calcium, phosphorus, and Vitamin D in therapeutically effective quantities, but leaves the individual free to meet other dietary needs by adhering to a sensible, well-varied diet of proteins, fats, carbohydrates, and fresh vegetables

The pleasantly flavored tablets or, for those who prefer, the capsules, provide in small, convenient dosage the daily requirement of calcium, phosphorus, and Vitamin D, at a cost remarkably lower than that for equal quantities of these elements obtained from natural food sources

One tablet or two capsules of Dicalcium Phosphate Compound with Viosterol contains 9 grains dicalcium phosphate, 6 grains calcium gluconate, and 660 (U S P XI) units of Vitamin D Tablets are available in boxes of 51 and 250, capsules in bottles of 100 and 1000

milk

one of the important alkaline-ash foods

To maintain the proper acid-alkaline balance of the system, it is essential that sufficient alkaline-ash foods be ingested to neutralize the total acidity of metabolism

Milk, green vegetables and fruits are three of the most valuable alkaline-ash foods because of their rich Calcium, Sodium and Potassium salts content.

Increased ingestion of milk is, therefore, a good and convenient way to maintain the alkaline-ash content (or alkaline reserve) of the blood *The Bureau of Milk Publicity, Albany*

For an Extra Factor of Nutrition

. . . VITAMIN D MILK

For an Extra Factor of Safety

. . . DAIRYLEA Vitamin D Milk

● A report by the A.M.A Council on Foods, printed in the A.M.A Journal of Jan 16, 1937, stated "The Council believes that a moderate amount of vitamin D in addition to that which is normally obtained is a factor of safety in nutrition and health, at least during the period of growth"

• • •

Dairylea Vitamin D Milk provides this extra factor of nutrition in constant, controlled amounts plus an extra factor of safety For Dairylea Milk is inspected-protected every step of the way from the farm to the home, assuring the physician of laboratory-controlled purity in the milk he prescribes

All Dairylea Vitamin D Milk is fortified by 400 unit Vitamin D extract from cod liver oil (Vitex) Dairylea Vitamin D Milk is sold in Buffalo under the trade name of Weckerle, in Troy and Cohoes, it is sold under the trade name of Cloverleaf

Our Pledge: We, the farmers of the Dairymen's League, recognize a definite obligation to the public. Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality

DAIRYLEA *Milk*

Produced by Dairymen's League Co-operative Association, Inc.

RANTOSILK *and* HOLLANDEX
For Home and Hospital Use

● For bed sheets, pillow cases, surgeons' aprons, and surgical garments used in hospitals, take advantage of Rantosilk or Hollandex—the last word in processed surgical fabrics. They are fine silk and lawn calendered with crepe rubber—are light in weight and will outwear much heavier material.

Their ability to withstand creasing, rolling and folding without the slightest harm to the surface commends it for hospital use They may be washed, boiled, autoclaved, stitched. Will not crack, peel, fade or stick. Resistant to acids, alkalies and heat The positive impregnation with rubber of each fibre accounts for the superiority of Rantosilk and Hollandex.

VISCEROPTOSIS SUPPORTS

After speaking of diet, exercise and medication in the treatment of visceroptosis, a writer* on visceroptosis continues as follows "Supporting measures are the most important influences in correction, but the prescribed supportive corset or belt with its pads must be designed and constructed to remedy the actual faults found upon X-Ray examination

Important rules which must be followed are as follows (a) The corset must first be adjusted while the patient is lying down and the uppermost part of corset or belt must never be pulled tight, but must be worn just comfortably snug so the uplift will not be obstructed (b) The corset or belt must be removed only during periods when patient is lying down "

A—Showing the stomach well below the crest of the ilium

B—Same patient after application of visceroptosis support

Camp surgical fitters are trained in our schools to observe the rules of the Doctors and to give proper instructions to the patients Camp visceroptosis supports are always constructed with two strap adjustments in order to allow of the "comfortably snug" adjustment of the upper part of the support

A corner of the consultation room in an Acousticon office This is typical of 150 offices maintained by Acousticon throughout the country

When the Problem is

DEAFNESS

we can help, doctor!

•

—with really accurate hearing aid fittings on the Aurogauge. . .

—with reports on patient reactions made directly to you . . . or a demonstration in your office.

—with 35 years of experience with the hard of hearing. . .

—with fully equipped offices in 150 cities.

FOR many years Otologists and Physicians have used the facilities of the Acousticon organization in their work with the deafened, secure in the knowledge that they could refer their patients to us with complete confidence

In 150 conveniently located cities Authorized Acousticians (carefully trained hearing aid representatives) are ready to serve you and your hard of hearing patients Here, by means of the recently introduced Aurogauge, Acousticon hearing aids are fitted in the newest and most accurate way—to the *individual requirements* of each patient. Behind these methods stand 35 years of specialization—more than a third of a century of ethical, dependable cooperation with the medical profession.

On request, detailed reports of the patient's reactions to different hearing aid assemblies are gladly submitted directly to the physician The patients you send here for fittings are not exposed to "selling," the atmosphere is pleasantly professional

Remember, please, that it has been sufficiently established that no Audiometer reading is more than a theoretical guide to the fitting of a hearing aid An "actual use" fitting is all essential—which function is efficiently performed with the Aurogauge at our offices *without charge* or obligation

Our nearest office is as close as your telephone, by consulting your phone book our representative will be at your command.

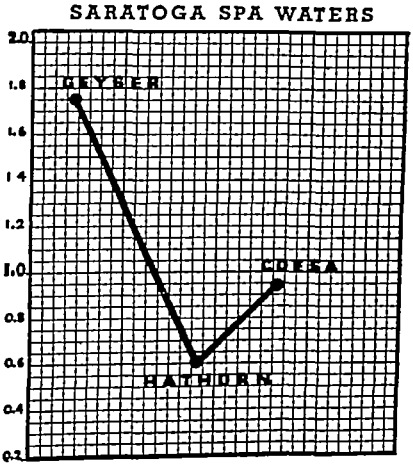
THE NATURAL MINERAL WATERS OF SARATOGA SPA
ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK

In Repairing a Mineral Deficiency



as in pregnancy, for instance, the value of the natural mineral waters of Saratoga Spa makes itself felt with particular emphasis The unique *natural* carbonation makes them palatable and encourages the patient to take the full prescribed amount

The richness of their mineral content is displayed in the tabular analyses of the three waters, as shown below All are of saline-alkaline type, but variable as to total mineralization and saline-alkaline ratios

The labile form of the contained minerals encourages their assimilation This is a mineralization impossible of artificial duplication Ready evidence lies in the fact that, once evaporated out of solution, the salts are not again entirely soluble That is why the State bottles the natural mineral solutions, and seals them under their own natural CO_2 pressure No air can touch them until the bottle is uncapped.

AND PROGRESS

THE GROWTH of the POYTHRESS' laboratories within a comparatively short span of life, may only be credited to the confidence and respect won throughout the medical profession

Steady increase in prescribing and using POYTHRESS' products has continually forced expansion and enlargement of facilities, memorializing a service to medicine

Nothing short of the most exacting quality in drugs and efficiency in compounding useful remedies could have gained such results, nor earned the patronage of an enlargening circle of practicing physicians

POYTHRESS and PROGRESS have become synonymous

PELVIORADIOGRAPHY

A Clinical Evaluation

CLAUDE EDWIN HEATON, M D, *New York City*
From the Obstetrical and Gynecological Service, Third Surgical Division, Bellevue Hospital and the Department of Obstetrics and Gynecology, New York University College of Medicine

In 1933 H C Moloy[1] reported a new method of roentgen pelvimetry based upon the practical application of stereoscopic technic The pelvic inlet may be viewed in its true size and shape by the use of the precision stereoscope. When in addition a lateral view of the sacrosciatic notch and sacrum and a forty-five degree angle view of the subpubic arch is studied, one may obtain a thorough knowledge of the pelvic architecture Study of the pelvis in this manner is known as pelvioradiography

On examination of a large series of the pelves of women by the above method, Caldwell and Moloy[2] found that they could be divided into four large groups based on the shape of the inlet To these the terms gynecoid, anthropoid, android, and platypelloid were applied

The gynecoid pelvis is the round normal female pelvis The anthropoid pelvis having an inlet elongated anteroposteriorly corresponds to the so-called transversely contracted pelvis The android or male pelvis has a blunt heart-shaped inlet with the widest transverse diameter situated near the promontory, the forepelvis being somewhat narrow The platypelloid or flat pelvis has an oval inlet with a wide transverse diameter and a shortened anteroposterior diameter Combinations of the four primary types are called intermediate forms in which the diagnosis of the primary type is based upon the shape of the posterior segment of the superior strait while the shape of the forepelvis indicates the nature of the combination

Three hundred cases delivered on the obstetrical service at Bellevue Hospital were studied by the method of pelvioradiography Cases were selected for x-ray because of a past history of obstetrical difficulties or because trouble was anticipated upon clinical examination

The pelves were classified in accordance with the terminology proposed by Caldwell and Moloy Table I shows the pelvic types divided into four primary groups based on the shape of the inlet

The incidence of "intermediate" or so-called borderline forms is shown in Table II, while the percentage of large, average, and small pelves in the parent groups is shown in Table III

Normal delivery, low forceps delivery or breech delivery occurred in sixty-two per cent of the gynecoid pelves, seventy-three per cent of the anthropoid pelves, forty-eight per cent of the android pelves, and 33 3 per cent of the platypelloid pelves Midforceps delivery was done in 25 6 per cent of the gynecoid pelves, twenty-four per cent of the anthropoid, twenty per cent of the android pelves, and only

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

TABLE I—PELVIC TYPES IN GROUPS

Type	*Number*	*Per cent*
Gynecoid	187	62 3
Anthropoid	41	13 6
Android	60	20
Platypelloid	12	4

TABLE II—INTERMEDIATE FORMS

Type	*Number*	*Incidence (%)*
Gynecoid	118	39 3
Gynecoid with narrow forepelvis	36	12 8
Gynecoid with anthropoid tendency	18	6
Gynecoid with platypelloid tendency	15	5
Android	23	7 6
Android with round forepelvis	17	5 6
Android with anthropoid tendency	4	1 3
Android with platypelloid tendency	16	5 3
Anthropoid	33	11
Anthropoid with gynecoid tendency	8	2 6
Platypelloid	12	4

TABLE III—PELVES IN PARENT GROUPS (%)

	Large	*Average*	*Small*
Gynecoid	18 5	59 5	22
Anthropoid	4 8	92 6	2 4
Android		50	50
Platypelloid		33 4	66 6

eight per cent of the platypelloid pelves Version was performed in 2 6 per cent of the gynecoid pelves, 2 4 per cent of the anthropoid, 1 6 per cent of the android, and in 16 6 per cent of the platypelloid Cesarean section was done in nine per cent of the gynecoid pelves, in 2 4 per cent of the anthropoid pelves, thirty per cent of the android pelves, and 41 6 per cent of the platypelloid pelves Small pelves were characteristic of the android and platypelloid types leading to a high incidence of operative interference

Gynecoid pelvis The gynecoid or typical female pelvis was the most frequent type observed The round inlet was often large in size Persistent occipito posterior positions and deep transverse arrest of the head occurred infrequently The incidence of cesarean section was low Labor was prolonged, however, as often as in the other types Seven viable babies were lost in cases with pure gynecoid pelves of adequate size as shown by x-ray We have found that prolonged labor terminating in difficult delivery may occur in a patient with a typical gynecoid pelvis in which no disproportion can be demonstrated Three of the above stillbirths occurred in a type of labor characterized by slow dilatation of the cervix and inertia, no disproportion existing between the pelvis and baby We have called this type of case, one of functional dystocia Three other stillbirths occurred in women with pelves of the funnel type where the inlets were of average size and of the gynecoid form

Anthropoid pelvis The pure anthropoid pelvis was observed in thirty-three cases We consider the anthropoid pelvis as a normal one occurring in the feminine but muscular type of woman To speak of the anthropoid pelvis as transversely contracted seems incorrect since the transverse diameter although shorter than the anteroposterior, is adequate.

Ninety per cent of our anthropoid pelves were of average size, small forms being apparently a rarity Only one cesarean section was required in this group in a case which we felt could have been delivered by the vaginal route if she had not had a previous cesarean section Aside from one macerated fetus no babies were lost in the anthropoid pelves Midforceps delivery was frequently necessary, twice as often for persistent occipitoposterior as for transverse arrest We favor the Kielland forceps as the instrument of choice in the anthropoid pelvis

Intermediate forms combining gynecoid and anthropoid characteristics proved to have practically the same obstetrical significance as the parent form There were few small pelves and cesarean section was seldom required Operative delivery, however, for persistent occipitoposterior positions and less often for transverse arrest was frequently necessary

Android pelvis The majority of android pelves were small and only about half the number terminated in easy delivery There was a marked increase in the incidence of cesarean section and difficult forceps deliveries Persistent occipitoposterior positions and transverse arrest of the head occurred with equal frequency in contrast to the anthropoid pelves where persistent posterior positions were more common

While generally speaking the android pelvis appears to offer a poor prognosis, the importance of other factors in labor

besides bony passage and size of baby should be kept in mind for in one case of this group with a true conjugate of 9 4 cm, a ten pound baby delivered spontaneously after a short labor

The platypelloid pelvis is found infrequently and tends to be small in size A high proportion requires cesarean section Platypelloid characteristics in an android pelvis produce an inlet offering the poorest prognosis for engagement of the head, fully half of the cases requiring cesarean section

The gynecoid pelvis with platypelloid tendencies was found to be particularly liable to produce transverse arrest of the head We prefer the Barton forceps for arrest of the head in this type of pelvis

Cesarean section was performed in forty-one of the three hundred cases but in nine the indications were bleeding, toxemia or heart disease, the pelvis being normal In thirty-two cases the pelvis and size of baby were factors The incidence of cesarean section at Bellevue Hospital is about 2 5 per cent We found the incidence of cesarean section was very low in the gynecoid and anthropoid group while in the android pelves the incidence was six times greater and in the small platypelloid pelves eight times greater

In eleven only of the thirty-two cases was cesarean section an elective procedure based on x-ray and clinical pelvimetry In the remaining twenty-one, decision was influenced in thirteen instances by the fact that the patient had had previous cesarean section Six cases were given a trial labor while in two, labor was prolonged In relatively few cases was it found possible to decide upon elective cesarean section from x-ray study alone

Conjugate vera Study of the conjugate vera is usually considered of the utmost importance clinically Cases fall into three groups those with a conjugate vera below 7 5 cm where decision is easy because absolute contraction is generally present. The borderline pelves with a conjugate vera of 7 5 to 9 cm present a difficult problem while in the third group where the diameter reaches nine to ten cm, delivery from below is the rule

Forty-nine of our cases were found by x-ray to have a conjugate vera under ten cm Comparing the figures obtained by estimating the true conjugate from the diagonal conjugate as measured by vaginal examination with the x-ray findings, we found the results by the two methods differed only 0 2 or 0 3 cm In the pelves with a diagonal conjugate of nine cm or more, delivery from below was the rule in the gynecoid group of the pure type In the android and platypelloid pelves, there was a high incidence of cesarean section In the cases with a diagonal conjugate below nine cm, the percentage of cesarean sections was high in all types of pelves, the greatest incidence being in the android group especially android pelves with platypelloid tendencies

Stillbirths Nineteen babies were lost in three hundred cases but four of these may be deducted because of nonviability, maceration or congenital defect In the remaining fifteen, the pelves of eight of the mothers were proven to be adequate on x-ray In one case terminating in version and craniotomy the diagnosis of adequate pelvis was proven correct by the subsequent delivery by Barton forceps of a living large baby, face presentation Too often the pelvis is considered the chief factor in an obstetric mishap, cesarean section being decided upon in future deliveries In this instance x-ray study proved to our satisfaction that the pelvis was not the main factor causing the stillbirth

There were five pelves of the funnel type in which stillbirth occurred, only two of these had normal delivery Labor was prolonged in six of the stillbirth cases in four instances of which the pelvis showed funnel characteristics

Prolonged labor Labor was prolonged twenty-four hours or more in fifty-five cases The incidence was practically the same for the four primary types of pelves Twenty-eight per cent delivered spontaneously, eighty-six per cent delivered from below without special difficulty This bears out the findings of Studdiford[3] who recently in a study of one hundred consecutive cases of prolonged labor concluded that the pelvis played a less important role than is commonly thought While this seems to be generally true we attach some significance to the fact that the group with poor architecture in the midpelvis had labor prolonged in thirty-five per cent of the cases Stillbirths were

also more frequent where labor was prolonged there being seven stillbirths or thirteen per cent in this group in contrast to five per cent for the series Nevertheless protracted labor *per se* is not indicative of an abnormal pelvis since in fifty per cent of these cases the pelvis was proven adequate by x-ray and eighty-three per cent delivered without difficulty

Funnel pelvis As Thoms[4] points out abnormal pelves may be divided into two general groups In one group contraction occurred chiefly at the inlet In the second group difficulty is encountered in the lower pelvis Funnel pelvis so-called is commonly thought of in terms of the classic outlet of the textbooks Moloy states that to date he has not encountered an example of absolute outlet contraction wherein the upper pelvis was ample enough to allow the head to descend to this low level He finds that absolute outlet contraction occurs chiefly in small typical android forms but rarely presents obstetrical difficulty because the inlet is also abnormal and the head fails to engage In our series we found no difficulty where the head reached the classic outlet *This is borne out by the fact that* no babies were lost in the normal delivery or low forceps group Our study would seem to show that considerable obstetrical difficulty is not infrequently encountered in pelves with abnormal architecture at the level of the spines and it is to this type of pelvis we believe the term "funnel" should be applied The sidewalls of the funnel pelvis slope in or converge. The enterspinous diameter is shortened The sacrum in the worst forms of funnel pelvis comes forward giving a so-called convergent lateral bore There were seventeen cases of this type and it is noteworthy that an unqualified favorable prognosis based on x-ray study or clinical examination was not given in any instance Only one case terminated in normal delivery and only four in low forceps delivery In one breech extraction the baby was lost There were four difficult midforceps deliveries all ending in stillbirths, thus, there were five stillbirths in seventeen cases of funnel pelves Four cases cesarean section and labor was prolonged in six

In these seventeen funnel pelves the inlet was of the pure gynecoid type in seven In the remaining cases there were two typical android pelves, two android pelves with flat tendency, three gynecoid pelves with a narrow forepelvis, two gynecoid pelves with anthropoid tendency, and one android pelvis with anthropoid tendency In fourteen of these cases the inlet was considered to be of ample size We believe that the role of the funnel pelvis is most important in causing difficult labor A lateral view of the pelvis and a view of the outlet are especially valuable in determining the degree of funnel pelvis No x-ray study should be considered complete with views of the inlet alone

Summary

Three hundred pelves have been studied by the pelvioradiographic method of Caldwell and Moloy Both the qualitative and quantitative information obtained by this method have proven extremely valuable in the management of labor We have not mentioned cephalometry because in our opinion exact measurement of the fetal head is seldom *required In only four of our* three hundred cases was true cephalopelvic disproportion found to exist In those cases x-rayed at term or in early labor we have been helped by using the fetus as a "yardstick" of measurement.

A *study of the architecture* of the pelvis has aided us in the choice of method of delivery by the vaginal route We have found the method very useful in teaching and in checking clinical findings We have discovered no great discrepancy between internal pelvimetry in experienced hands and the findings on x-ray so far as prognosis for delivery is concerned While in only a small number of cases have we been able to decide upon elective cesarean section from our x-ray studies, *this is to be expected In many cases we have felt more* secure in allowing the patient to deliver from below when armed *with the knowledge* x-ray has given us

Conclusions

Pelvioradiography is a valuable diagnostic aid in obstetrics when combined with clinical acumen

Pelves of the android type, especially those with platypelloid tendencies, offer the poorest prognosis for vaginal delivery

Anthropoid pelves offer a good prognosis although persistent occipitoposterior positions frequently require midforceps intervention.

Prolonged labor, dystocia, and difficult delivery often occur in an adequate pelvis.

The funnel pelvis is a frequent cause of obstetrical difficulties and may be present with an adequate inlet A lateral and outlet view of the pelvis is always necessary for complete x-ray study

In relatively few cases is it possible to decide from x-ray study on elective cesarean section

DISAPPOINTMENTS IN DIPHTHERIA PREVENTION

"Drives" for the prevention of diphtheria do not always produce the happy result that was expected, said Dr H N Bundesen, president of Chicago's Board of Health, addressing a conference of Ohio's health commissioners at Columbus a few weeks ago

"Inoculation does not necessarily mean immunization," he declared

When a child is given preventive inoculations against diphtheria, one of three things may happen within a varying period of time, Dr Bundesen said *First,* within two to six months he may be protected against the disease, *second,* protection may appear and then, within a short time, disappear, *third,* the injections may not produce immunity at all

He said it has been stated by many authorities that, before a child is immune to diphtheria, he must have 1/25 of a unit of diphtheria antitoxin per c.c. of blood and that studies in Chicago reveal that many children who are Schick negative have far less than this amount of antitoxin, many having as little as 1/500 of a unit.

"Chicago's childhood population has about 800,000 children below fifteen years of age," he said. "It is estimated that about eighty-five per cent, or 680,000 have received some sort of inoculation to prevent diphtheria This leaves an estimated, uninoculated child population of about 120,000 under 15 years of age. Our Schick testing indicated that, roughly, of about twenty-five per cent of the children inoculated, approximately 170,000 are still susceptible To this must be added those who, even Schick negative, still do not have sufficient antitoxin content in the blood to protect them If we assume that fifty per cent of the 120,000 uninoculated children are susceptible to diphtheria, plus the 170,000 inoculated but Schick positive children, plus an undetermined number of Schick negative but still susceptible children, we have more than 230,000 of the childhood population unprotected, practically one out of three The figures dramatically show health officers that they must beware of making the error of believing that because large groups of children have been inoculated with various types of antigenic material, diphtheria will be completely eradicated"

Dr Bundesen stated that recent evidence indicates that more prolonged and lasting immunity is produced when the antigenic material is injected in more doses, and with larger intervals between doses

"We have therefore adopted the procedure of giving three injections of plain toxoid the first, one-half c.c and the second and third, one c c each, making the inoculations a month apart and starting as soon as possible after the infant is about one year old We feel that by using this type of inoculation, more lasting protection against diphtheria may be produced Plans have been made for additional blood tests after a suitable time to settle this point," he said

---

Medicine is not a trade—it is a profession close to the people, perhaps closer than any other—and the public will do well to keep their medical problems away from the politically-minded reformers—*Journal of the Medical Association of Georgia*

A proud father called up the newspaper office to report the birth of twins The young lady at the telephone did not get the item clearly, so she said "Will you repeat that?" Said he, "Not if I can help it!" —Ex

SUPERVISION IN COMPENSATION CASES

JOHN J MOORHEAD, M D, *New York City*

The relationship of Compensation Laws to the management of the injured has always been a subject of controversy The original essential purposes of such laws was (1) to provide the employee with funds during enforced idleness, (2) to provide adequate surgical and medical care, (3) to provide a pension for dependents, (4) to prevent litigation

As time went on these essential purposes were increased or modified, so that eventually certain occupational diseases were made compensable, and illness in general was more or less directly linked to injury The New York State Compensation Law became effective in 1914, and from time to time it has been modified Last year the trend of the law was greatly changed by providing that the injured employee could choose his own medical attendant, or change his medical attendant for certain reasons The avowed purpose of this amendment was to provide better care and attention for the injured, and incidentally to enable the employee to retain his own doctor, and in that way cease to be exploited by groups who formed so-called Compensation Clinics wherein the treatment was justly subjected to harsh criticism The question of insurance companies maintaining clinics also entered into the situation The fee schedule was involved also, and indeed the whole process became one in which there was a mixture of professional treatment and medical economics It is yet too early to properly appraise the merits or demerits of the new order of things, but nevertheless there are certain features clearly enough delineated for comment

If you were asked to design a Compensation Law that would fulfill the chief requirements, what provisions would you seek to include? Without much disagreement, I venture to say that the following essentials would be recognized

1 Every occupational injury should be made compensable

2 Every injured employee should be provided with adequate care and treatment during the disability period

3 Death benefits should be provided for dependents

4 Doctors and hospitals and laboratories should be paid

5 The medical and surgical phases of the Law should be managed by doctors

6 Compensation Boards should be aided by doctors of experience, and the salary of certain compensation doctors made attractive enough to recruit from our profession the same type of doctor we would choose for consultants in noncompensation cases

7 There should be a Supreme Court of Doctors who would act in disputed cases, these appointees would be nominated or chosen by the local or State Medical Societies, the Medical Colleges, or by the local hospitals This Court of Doctors would be the final source of appeal and their decision would be binding on all concerned

8 You would concede that in certain cases a lump sum adjustment would aid in recovery, and to that end the Court of Doctors would make a decision that would be satisfactory to all concerned

9 You likewise would concede that certain doctors had special skill and experience in the management of certain injuries and you would like the privilege of having their opinion in compensation cases just as you already had their opinion in noncompensation cases

10 In short, you would like to carry out the treatment of your compensation case in the same manner as you carry out the treatment of your noncompensation case

11 You would reduce the paper work to a minimum

12 You would seek a remedy to relieve you from the tiresome cross-examination of that branch of the legal profession which has succeeded to the pursuit of ambulance chasing

13 You would ask your local Medical Society to record the members of your own profession who had become professional witnesses and who had little if any practice outside of the Compensation Board hearing rooms

14 You would give some designated medical group access to the records of the Compensation Board so that the end results and costs of injury might be compiled

15 You would agree upon some definite

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

method by which end results could be mathematically appraised, and you would seek some means by which these ratings were subjected to frequent review

16 You would ask the American Medical Association or the American College of Surgeons to appoint a committee to determine the relationship, if any, of certain injuries to disease. Is there any such thing, for example, as traumatic appendicitis, traumatic pyloric ulcer, traumatic cancer, traumatic pulmonary tuberculosis, traumatic diabetes, traumatic arteriosclerosis, traumatic arthritis deformans, or traumatic brain tumor? You are clinically very doubtful as to this relationship and rarely ever hear of it except in medicolegal exigencies

17 You would like to have the question settled not only as to causation but also as to the aggravation or acceleration of disease by trauma Likewise you want to know if there is any such thing as a casual injury "lowering the resistance" to such an extent that a week after this trivial injury, or a year after it, the patient had a stroke of apoplexy, or an attack of coronary thrombosis, or developed a cardionephritis

In this law you would set aside a fund for investigation of some of these problems by a representative group of our own, so that the answer would have some scientific background and thus be taken out of the pseudo medicolegal category that is now so besetting and so at variance with our ordinary clinical interpretations

As to most of these foregoing, the majority of practitioners would agree, for in reality these things are already written large in the book of our own experience or in the experience of our forebears Their attainment is not out of reach by any means, and the united opinion of the profession on the *essentials* would lead to agreement on the *details*

The existing law has in one particular sought to safeguard more adequately the physical welfare of the injured, and that is by the provision that a consultant may be procured if desired Here an attempt is advisedly made to apply to the compensation case the same safeguards you and I apply to a noncompensation case The practitioner afraid of a consultation is usually a practitioner afraid of himself In this day of hospital staff conferences and clinical meetings, self-sufficiency is not rated any too high, because group meetings of that sort are virtually management biopsies that show up the defects inherent to us all

You have implicit reliance on certain consultants because you have hitherto sought and profited by their advice in noncompensation cases Now is afforded the same opportunity in compensation cases, and this provision is welcomed by every forthright practitioner An attempt has been made in the new law to appraise doctors as to their ability to manage certain types of injury Virtually this seeks to legally bestow the title of specialist on certain groups, and naturally enough there is complaint as to this feature Compensation practice is the most competitive type of practice, and perhaps the survivors in it will not be those who merit it, so much as those who obtain it by business methods Already there are groups who are well-organized in having cases referred to them by various agencies rather than by the proven merit of professional experience and skill In this day of organized labor, it is not difficult to foresee that certain doctors will become medical attaches of labor organizations and that this group of the profession will become a very definite part of the new order of things However, the time is not far distant when Medical Licensing Boards of the American Medical Association and others in organized medicine will set up standards that will adequately safeguard the injured and thus prevent wholesale exploitation Here it is pertinent to say that graduate medical education is beginning to be valued by practitioners who are actually seeking to increase their knowledge by additional study Many institutions are giving intensive courses in traumatic surgery, and I recommend this type of self-betterment to you The time is coming when every enlightened community will insist on the local doctor taking off time enough to attend some refresher course so that he may return to his own clientele better prepared to manage the medical and surgical needs of his own people

Indeed, in some communities a fund has been set aside for this commendable purpose so that the doctor may not have to bear the entire financial burden while absent from his practice That is as wise an investment for the community as it is for the doctor, and the idea now incipient is bound to grow

because of inherent wisdom and self-interest

There are certain clinical phases of compensation practice in dire need of reappraisal to the end that the responsibility of trauma may be scientifically allotted The situation is now not unlike that in insanity cases, where expert is battling expert, all of which leads to confusion and distrust The hernia situation, for example, is beclouded because one group asserts that this lesion is always traumatogenic, and another group completely dissents There is no responsible authority maintaining that a complete hernia can be *caused* by any single act of trauma, unless muscular disruption occurs. Hence the problem should narrow down to the aggravation of hernia by the injury in question This can and does occur, but in the process certain very definite signs and symptoms appear Personally I believe hernia to be a progressive disease, and on several occasions have spoken and written in support of that conception Many years ago I compared the inguinal canal to the cervical canal, stating that the internal os might be said to resemble the internal ring, and the external os the external ring Given, then, impregnation or a preformed sac, the inevitable progression of time, plus intra-abdominal pressure will give birth to a fetus in the one case, and to a hernia in the other case

Another clinical fog surrounds the relationship of trauma to disease No one has yet claimed that a bump on the chin causes pyorrhea, or that a blow on the abdomen causes typhoid, or a fall on the buttocks causes prostatic hypertrophy But there are claims just as remote as these, and strangely enough they are never heard of outside of the realms of that peculiar hybrid that we can call medicolegal pathology

One of the great problems in compensation practice relates to the effects of injury upon the aged employee Virtually the Compensation Law has become a Pension Law in some instances, and I know of nothing more difficult to appraise than the responsibility of a simple trauma said to have activated or aggravated a process that clinically must have been developing ten years or more Osteoarthritis is in that class, and just now I have a patient who has been sent to me because he has a classical so-called poker-back spine with real disability His vertebral column and his interspinal attachments are definitely calcified and his mobility is greatly restricted All of this is said to be the outgrowth of a relatively trivial injury, and my task is to make an appraisal as to where and when the traumatic effect ceased and the old pathological process was re-established

Then there is the vascular group, the varicose veins, the endarteritis and their complications said to be associated with minor injuries Likewise cardiac crises are often asserted to be linked to a trauma, perhaps in and of itself quite inconsequential

These are phases that are fogged by too much individual opinion, and what we need is a survey by some accredited agency so that the exact relationship can be established Then your opinion and my opinion can heed the voice of experience and be guided by the wisdom of the peers of our profession

Hysteria was once called "the great mimic" because it wove itself symptomatically into so much of the fabric of other diseases Today, trauma has become the successor to hysteria from an etiologic standpoint, and injury is asserted to be the factor in a host of diverse lesions that have hitherto been wholly unrelated This association has been fostered by medicolegal more than clinical experience, and the tendency is to forget that trauma has responsibilities enough without being burdened by specious reasoning that seeks to fasten upon it a causal relationship that belongs elsewhere In the days of the "ambulance chaser" this procedure was quite in fashion, and it now seems evident that this same development is becoming quite prevalent in the compensation field

The responsibility of the profession in relation to the Compensation Law is more binding than ever before, and it rests with us to codify and clarify so that much of the existing confusion will disappear After all traumatic surgery is the most ancient form of surgery, and a broken leg is still a broken leg with known hazards irrespective of the legalistic meshwork that sometimes enshrouds and bedevils

In the dilemma presented by a medicolegal problem, we can often arrive at a saner conclusion if we propound to ourselves the question "What usually and ordinarily happens under the same circumstances?" In other words, the lessons of experience should be our guide just as they are when confronted by any other problem

Discussion

Dr. R. J McMahon, *Endicott*—Dr Moorhead has brought to us the homely truth "that there is nothing new under the sun" and that the practice of medicine is or at least should be the same in compensation cases as in noncompensation cases In other words the same principles of ethics hold good no matter who is paying the bill

As has been pointed out by Dr Moorhead, one frequently feels that perhaps there is a new system of medical practice in vogue today when listening to the exaggerated claims of causal relationship between certain trivial injuries and definite pathological entities that have a well-known and natural sequence. This is unfortunate both to the employee and the profession In the former it has led to the discrimination of employers against any man beyond forty getting a new job and this, I believe, is a serious matter To the profession it brings discredit and distrust, because for centuries the physician has been held in the public mind as honorable and above reproach and we should all strive to keep that deserved prestige

Dr Moorhead praises the present law because it permits, at least theoretically, the protection of competent consultants the same as is employed for noncompensation disabilities

I agree with this but wonder how many of the great industries let it be known that it does not help their employees' standing with them when they make use of this legal right.

Dr Moorhead has stressed the necessity of establishing competent committees to study and determine the relationship, if any, of certain injuries to disease, such as traumatic appendicitis, traumatic peptic ulcer, traumatic cancer, traumatic tuberculosis, traumatic diabetes, etc. I believe such authoritative information would be very valuable to the physicians and the courts in handling these difficult problems

The care and management of compensation cases requires as much ability and skill as any other type of cases and Dr Moorhead has correctly stressed the importance of frequent courses in graduate study for physicians caring for these cases I doubt if this is very commonly done The present law permits the classification of physicians as competent in certain fields There is naturally enough reason for complaint in this feature. However, I believe it is a step in the right direction and with the cooperation with such bodies as American Medical Association, American College of Surgeons and Physicians, and other special societies, it won't be long before everyone who claims to be a specialist will have to prove it to one of these organizations

In conclusion, Dr Moorhead summarizes his message to us in the plea for each of us to assume our share of responsibility in the just and adequate administration of the compensation law and that when confronted by these perplexing problems mentioned, to simply stop and ask ourselves the question "what usually and ordinarily happens under the same circumstances?"

ALL NEW ZEALAND SICK TO HAVE THE BEST OF EVERYTHING FREE

Medical practice in New Zealand is "at the crossroads," according to a report in the *AMA Journal* It seems that the government has the ambition of providing a complete health and medical service for the people of New Zealand, whereby the best possible service is available, free of charge, to all members of the community irrespective of their financial situation. The government desires to give every citizen sound physical health and a longer expectation of life through free advice and treatment from the best doctors available As one member of the government, Dr T G McMillan, the member for Dunedin West, expressed the government's ambition "We do not want a medical service geared by the poor man's pocket, but we want the best available to every one."

It is considered that the complete nationalization of public hospitals will be the inevitable outcome of the government in its attitude toward medical services At present in New Zealand the state pays the whole cost of schools, and the education system generally, from taxation funds And the same principle is intended to apply to medical service

BENIGN AND MALIGNANT LESIONS OF THE BREAST

Diagnosis and Treatment

LOUIS C KRESS, M D, F A C S, *Buffalo*
Assistant Director, Division of Cancer Control

The lump in the breast presents a difficult problem as to proper diagnosis It is the purpose of this paper to chart a direct course of procedure for the examination and treatment of patients suffering from tumors of the breast and to discuss various types of benign and malignant lesions of the breast

The first step, of course, is the history It should be comprehensive and detailed with the idea of bringing out points which may aid in the ultimate diagnosis Age is of some significance The small lumps found in the breasts of young girls before puberty are usually not malignant In the middle-age groups, the lumps may or may not be cancerous while those in the older group usually are malignant. The approximate duration of the lump is important If the lump has been present for a period of years without apparent change and causes no discomfort, it is in all probability a benign lesion If the lump remains quiescent for awhile and then starts to change in respect to size, shape, appearance or feeling, there is undoubtedly a beginning malignancy

In the presence of one lump it must be remembered that cancer is usually a single lesion Multiple tumors are inclined to be noncancerous Undue restraint by tight, binding clothing which is a form of chronic irritation was once considered responsible for congestion of the breasts but that idea is now being discredited as a cause of breast tumor Inquiry should be made regarding chronic irritation due to pregnancy—e g, caked or abscessed breasts If the breasts are not allowed a normal lactating period, the milk will break down forming acid products which act as chronic irritation to the breast tissue The menstrual history should be elicited to determine any irregularity or state of pregnancy Cancer of the breast in pregnant women is usually fatal

The subject of slight injury, chronic irritation, and one single sharp injury, or trauma, and its relationship to cancer of the breast is a highly debatable question Most patients on discovery of a lump will attempt to connect it with trauma, in spite of the fact that the injury, if recalled, was very slight, causing no pain or discoloration of the skin and not requiring a physician's attention In many instances it is learned that the injury was very trivial and in some cases had never occurred

Pain may be a clue in establishing the correct diagnosis in breast tumors Cancer at its inception as a rule is not painful At times a patient will complain of real or imaginary pain shortly after the onset of breast cancer The pain may be associated with menstruation in which case it is usually due to a hormone disturbance affecting the breasts.

The patients should be asked to describe in their own words the appearance of the affected breast and the growth since the first symptom was noted The mental picture thus gained will suggest probable diagnoses The texture and appearance of the skin over the breast should be described The patient should be questioned as to the lump and ulceration Any change in the nipples, such as retraction, ulceration or discharge, is important The nature of the discharge should be ascertained, also whether the discharge can be expressed by pressure of the patient's hand on the breast The patient may complain of lumps in the axilla or supraclavicular region, causing pain and discomfort, in which case she should be asked if the skin over the nodes is red and if there has been any discharge Pain in the arms and legs is an occasional complaint and is usually due to metastases to the dorsal or lumbar spines History of a cough associated with a lump in the

Read at the Annual Meeting of the Medical Society of the State of New York Rochester, May 25, 1937

breast may be a coincidence or a pleural or lung involvement

Former major and minor operations and previous treatment including surgery, x-ray, radium, ultraviolet, electric, and home remedies should be noted This information is highly important to the examining physician and the patient's statements must be carefully checked before further surgery or treatment is instituted The patient's average weight should be compared with the present weight The loss or gain may be significant.

After the history is obtained, a complete physical examination should be done with special emphasis on the affected breast, chest, axillae, supraclavicular regions, spine, and skin Many points will be noted by inspection with the patient in a sitting position One breast may be larger than the other or lie on a higher plane The skin may present the so-called "pigskin or orange-peel" characteristics It may be retracted in areas causing marked wrinkling or ulcerating An ulcerating nipple, however, may be due to Paget's disease or to chronic infection Retraction of both nipples means very little but on noting retraction of one, the cause should be determined, as it may be the outward sign of the tumor of which the patient complains The arms should be inspected for edema caused by blockage of the lymph circulation

Palpation of both breasts is important Often pathology exists in the apparently normal breast although the patient is unaware of it Palpation should be done with the patient sitting upright on the examining table and again with the patient in the supine position The breast should be gently compressed against the chest wall with the palm of the hand, not with the finger tips Bimanual palpation often reveals helpful information These various methods must be used with great care because it has been shown experimentally that rough handling of tumors of the breast will cause dissemination of the cancer cells to distant points of the body via the blood and lymph streams

The nodes in the supraclavicular and cervical regions are palpated with the patient in a sitting position, the physician standing before and then behind the patient The axillary nodes are more easily palpated from the front, the examining hand exploring the entire axilla while the patient's arm is extended outright from the body, brought slowly to the side and then held a short distance away from the body Thus the entire axillary contents are examined to determine the presence of nodes It is not, of course, possible to always tell whether or not the nodes are metastatic by palpation alone Metastatic nodes are usually firm and rather hard There may or may not be periadenitis present When nodes are palpated in the axilla and there is a palpable tumor in the breast, they should be considered cancer until proved otherwise. Occasionally nodes not palpable on examination are discovered only upon operation

Transillumination is a decided aid in differentiating between cystic and solid tumors and is a very simple procedure A diagnostic light is necessary It may be an especially designed lamp manufactured by one of the large electrical concerns or a pocket flashlight The patient is seated on the examining table in a dark room and the light is placed under the breast allowing it to shine through the breast tissue Transillumination is not diagnostic of cancer but it shows whether the tumor is cystic or solid If the cystic fluid is very thick, it appears as a shadow which looks not unlike solid tumor In any event, the microscope is still necessary in making a definite diagnosis

The location of the lump in the breast provides a lead as to where metastases may be found Tumors of the inner half frequently metastasize to the mediastinum and lungs while those in the outer quadrant usually spread first to the axilla The examining doctor should determine definitely if there is more than one tumor in the breast, if the other breast is also affected, if the tumor is hard or fluctuant, if the edges are definitely rolled or clearly defined, if the tumor is diffuse extending into the surrounding tissues, and if it is attached to the skin above or to the muscles beneath.

The tumor should be palpated gently causing slight pressure to determine if

the tumor drains through the nipple Bleeding from the nipple is significant of an interductal growth which may be chronic mastitis, duct papilloma or duct carcinoma Carcinoma metastasizes to the liver and it is therefore important to palpate the liver for size and to learn whether it is smooth or nodular Should the history reveal pain in the extremities or spine, the affected bones should be palpated The doctor should not be satisfied with a diagnosis of arthritis but should insist upon a radiograph to definitely rule out metastases

Auscultation may reveal fluid in the pleural cavity, massive consolidations or collapsed lung Again an x-ray film should be made The value of radiography in the diagnosis of breast tumors should not be underestimated When malignancy is suspected, a radiograph of the chest should be a routine procedure and in the presence of pain in the bones, x-rays of the spine and the long bones are imperative though often neglected

Patients who have tumors of the breast with no demonstrable regional metastases yet complain of pain or neuritis in distant bones may have metastases in the spine causing pain to radiate to these areas Many patients would escape operation if a thorough radiographic study had been done Symptoms are often present previous to the appearance of lesions in the bones, especially in the spine, and the condition is usually revealed through radiograph When this condition exists, radiation therapy should be given

The common types of tumor found in the breast are classified as benign (noncancerous) and true cancer The usual benign tumors are abscess, cyst, fibroadenoma, duct papilloma, chronic mastitis, and tuberculosis The malignant growths are duct carcinoma, adenocarcinoma, Paget's disease of the nipple, myxosarcoma, and fibrosarcoma The pathological differentiation of these tumors will not be discussed in this paper The size of the malignant tumor has no bearing on the type of tumor or degree of malignancy Small tumors may cause metastasis more quickly than some of the larger growths Only time and the microscope can tell the degree of malignancy

Abscess of the breast is usually a fluctuating, diffuse swelling accompanied by pain, rise in temperature, and later reddening of the skin in the affected area At times the temperature may remain normal and the pain be only slight Frequently a diffuse, low-grade abscess has been mistaken for cancer and in one known case, large doses of radiation failed to break down the tumor and the diagnosis of abscess was made after mastectomy At times an abscess of the breast closely resembles the so-called inflammatory carcinoma of the breast and it is difficult to differentiate The best method is to insert a needle to determine if pus is present If it can be obtained, immediate and efficient drainage should be instituted through a small incision which does not extend beyond the areola The adhesions in the abscess cavity are loosened with the finger and a drain inserted In this way a good cosmetic result is obtained, breast damage is diminished, and hasty healing is promoted An inflammatory carcinoma of the breast should not be incised as the result is damaging

Cysts of the breast are encapsulated tumors with rounded borders which are regular in outline and seem to fit into the surrounding tissues They may vary greatly in size and upon insertion of an exploratory needle may be found to contain a dark brown, bloody fluid "Blue-domed" cysts contain blood and cholesterol and cystadenofibromata may contain a milky fluid Cysts are often multiple and scattered throughout the entire breast Fluctuation of the tumor may be absent due to tension within the cyst wall and the cyst may be deeply embedded in surrounding tissue Transillumination does not reveal a cyst unless the contents are thick enough to prevent light from passing through The recognized treatment is removal of the single cyst or withdrawal of the fluid whereas in the case of multiple cysts extending throughout the breast, a simple mastectomy should be performed Along with the cysts might be mentioned the hematoma which resembles the former but usually has a history of ecchymosis following an injury to the organ Radiation does not influence these various cysts

Fibroadenomata are usually very firm,

not painful, with a distinct palpable border which is usually regular in outline It is difficult and at times almost impossible to differentiate between a cyst and a fibroadenoma There are no nodes palpable in the axilla The presence of nodes in the axilla may be due to a simple hyperplasia Transillumination will reveal a dark shadow significant of a dense tumor Treatment consists of surgical removal with microscopic diagnosis

Chronic mastitis manifests itself as multiple nodules scattered throughout both breasts. If, however, upon palpation of the breast, one nodule is found to be harder, firmer, and more discrete than the rest, malignancy should be considered, as it is often associated with chronic mastitis Various forms of therapy including ovarian hormones have been administered in this disease with gratifying results in some instances, in others, the condition has persisted Simple mastectomy is resorted to in some cases and here again radiation has no effect

Tuberculosis in the breast while not common does exist and is sometimes associated with malignancy Seldom does this condition go on to abscess formation but when it does, there will be multiple sinus formations present A diagnosis of chronic mastitis is usually made preoperatively but tuberculosis is found upon microscopic examination The treatment of choice in case of abscess formation is removal by means of simple mastectomy If radiation is used, very small amounts should be given

Teratomas of the breast are occasionally seen as are the osteomas and chondromas The latter two may be classed as teratomas with bone or cartilage predominating Surgery is the indicated method of therapy followed perhaps by irradiation, depending upon the microscopic findings

Syphilis of the breast is rare occurring as a fibrous lesion In spite of the many positive Wassermanns found, luetic lesions of the breast are rare

True cancer of the breast Cancer may be of two types—carcinoma and sarcoma Carcinoma is the more prevalent form Sarcoma which is occasionally seen may be of the myxosarcoma or fibrosarcoma type We sometimes see the myxofibrosarcomas in men as well as in women Cancer of the breast is more frequently found in women but it is our privilege at the clinic to examine from four to six men yearly who are suffering from this malady and from these meager clinical records we feel the disease is just as malignant in the male as in the female

Symptoms of cancer of the breast It is well to divide the symptoms of cancer of the breast into early and late groups Physicians would be well pleased if they were called upon to treat only cancer of the breast which falls in the operable class Of course, it is too much to anticipate at this time but we hope by the present extensive educational campaign that the increase in the number of operable cases will be a reality within a short space of time The early symptoms of cancer of the breast are the lump in the breast, bleeding from the nipple, and ulceration, which if it becomes extensive, may destroy the nipple and the skin surrounding the nipple Late symptoms of cancer of the breast are retraction of the nipple and the skin due to the fibrous contraction of the malignancy below, also the pigskin or orange-peel appearance of the skin due to lymph blockage Patients may complain of a large, firm, palpable mass involving a small section of the breast or the entire breast with or without ulceration Other indications are extension from the breast to the glands in the axillae, supraclavicular regions or mediastinum, also neuritic pains in the extremities due to extension to the spine or even to the bones themselves

Operable carcinoma of the breast Truly operable carcinoma of the breast is one confined to the breast, not attached to the skin above or the underlying tissues with no demonstrable metastases to any of the lymph-bearing areas However, if only these cases were operated upon, about ten per cent of the women suffering from carcinoma of the breast would be subjected to surgery It has been our custom to consider that a breast is operable when there are nodes palpable in the axilla We are all familiar with the textbook description of malignant metastases in the axilla, but

at times nodes that are thought to be malignant, are found upon pathological examination to be hyperplastic and contain no malignancy whatsoever When this occurs, it proves that we are dealing with a truly operable carcinoma of the breast. If these cases are not operated upon, some women would not be given a proper chance of becoming well and in due course of time the cancer would extend to the axillary nodes This carcinoma, then, would no longer be operable and the chances are that it would extend further Consequently, it has been our practice to consider that even though there are nodes palpable in the axilla, such a patient is a good surgical risk

The possibilities of the lump in the breast When a lump in the breast is sharply defined, cancer should be regarded and the lump considered cancer until proved otherwise All of the benign lesions should be carefully eliminated during the course of the examination A lump in the breast should never be merely observed but an effort made to prove the exact nature of this lump The best method at our disposal today is the use of the microscope

Methods of diagnosis Inspection and palpation of the breast will at times give a clue as to the true diagnosis It will surely give the outline of the tumor, its consistency and size If nodes are palpable in the axilla, there is a strong suspicion that the lump in the breast may be malignant Transillumination is not a positive diagnosis for cancer in the breast, but it is an aid It will reveal the size of the tumor, also tell whether it obstructs light and whether it is discrete or diffuse One of the best procedures we have is the insertion of an eighteen-gauge needle attached to a syringe that will give good suction thereby procuring a section of the tumor without causing much discomfort to the patient and little or no traumatization Aspiration biopsy will tell whether the tumor contains fluid If the capsule of the tumor has been distended and is tightly stretched, the feeling of fluctuation will not be obtained and a solid tumor will be suspected, the aspiration needle will give the correct clue The material obtained by means of aspiration biopsy is forced out of the needle by the insertion of a stylet into the lumen of the needle and then placed in a bottle containing ten per cent formalin

At times enough tissue can be obtained from which a frozen section can be made Of all the aspiration biopsies performed in this clinic last year, the pathologist was able to give a definite diagnosis in seventy percent of the cases In our opinion a biopsy can do the patient no harm It will neither stimulate the tumor to grow nor disseminate the tumor causing metastatic involvement Some authorities are fearful of inserting the exploratory needle for fear of causing infection, but this has not been our experience There are many advantages of the aspiration biopsy We do not expect the pathologist to tell us the grade of the tumor or whether it is radioresistant or radiosensitive, only whether it is benign or malignant Naturally, if he is able to give us these factors, this knowledge is always welcome In clinics which practice preoperative radiation, the aspiration biopsy is a distinct advantage because there is definite proof that a cancer of the breast is being subjected to preoperative radiation None of us should expose a patient to this type of therapy unless we know definitely that we do it for a malignant condition

Another method of definitely making a diagnosis of a palpable tumor is to make a wide excision of the tumor either under local or general anesthesia and if possible have a table diagnosis to determine just how much surgery must be performed If the facilities for table diagnosis are not available, no harm can result in the removal of such a tumor if a wide enough area of tissue is removed Often in very early carcinoma of the breast, this has proved sufficient but is rather risky as in the presence of carcinoma in the breast, the entire gland should be removed

Bleeding from the nipple This symptom is caused by cancer in fifty per cent of the women in whom it occurs The other half are suffering either from duct papilloma or chronic mastitis When a palpable tumor is associated with bleeding from the nipple, the diagnosis is not so difficult as the tumor can be removed and the findings substantiated by means

of the microscope When there is no palpable tumor and bleeding from the nipple occurs, it is difficult to determine by palpation and gentle pressure the area of the breast which is the source of the bleeding Removal of a section of the breast is a perplexing question as it is hard to differentiate the offending portion from the rest of the breast tissue This may result in an improper diagnosis if the lesion is too small or the wrong section of the breast may be removed We have x-rayed a few women who complained of bleeding from the nipple but refused us permission to investigate the cause The result in some cases was gratifying and in others the tumor finally appeared and was found to be malignant In order to be on the safe side, I believe this symptom of bleeding from the nipple, especially in women approaching the menopause, should be relieved by simple mastectomy One is always taking a risk when treating with radiation a symptom or a tumor of which the exact cause or nature is not known When a tumor is associated with bleeding from the nipple and nodes are palpable in the axilla, a more radical procedure must be followed

Paget's disease We do not consider Paget's disease a precancerous lesion but a definite malignant growth. There is a controversy as to whether it begins in the skin and grows downward or originates between the milk ducts and grows upward Paget's disease usually manifests itself by an ulceration, excoriation, itching, crusting, and change of color of the nipple If this is allowed to go untreated, it will result in the destruction of the nipple, areola, and also the breast Some patients suffering from this disease where surgery was contraindicated have received an excellent palliation with x-ray and radium An excoriation of the nipple which has not resulted in a palpable tumor mass or nodes in the axilla can be treated best by simple mastectomy If nodes are found in the axilla together with a palpable tumor in the breast, with destruction of the nipple and areola, a more radical procedure is necessary Usually a simple mastectomy will suffice for the cure of Paget's disease when there are no palpable nodes in the axilla

Advanced cancer It is always a problem to definitely determine which method of treatment will best serve the far-advanced cancer of the breast In this stage the disease is very easily diagnosed and the patient usually complains of all the symptoms of advanced cancer or a large number of them At times surgery is indicated for hygienic purposes in order to make the patient more livable with herself and family, especially when there is a large, ulcerating, infected tumor mass The method of choice in the treatment of far-advanced cancer of the breast is radiation in the form of x-ray or radium in any combination That is, (1) a small increment of x-ray may be applied to the breast, axilla and supraclavicular region over a long period of time, (2) several fairly large massive doses may be administered over a short period of time or (3) the radium pack may be used

Inflammatory carcinoma of the breast This particular form of cancer is infrequently encountered and is quite difficult to diagnose It usually manifests itself by a very rapidly growing tumor with inflammatory reaction in the skin of the breast The patient becomes very toxic and nodes are generally found in the axilla It is a mistake to make several stab wounds in such a tumor as is frequently done. The better way is to endeavor to establish a diagnosis by means of the aspiration needle As far as treatment is concerned, no form has proved satisfactory in either the inflammatory carcinoma of the breast or the carcinoma found in a lactating breast Surgery has offered practically nothing and neither have the different forms of radiation

Cancer found in young women under thirty years of age Cancer found in young women under thirty presents a very puzzling problem If the malignancy in these young women is confined to the breast alone and it is purely an operable disease, the results from surgery are quite gratifying, but after it has metastasized the five-year cures are very low averaging about seven per cent. This is a group in which all of us should be interested and we are changing our treatment in this type of malignancy frequently, endeavoring to get some specific results We have tried extensive radia-

tion, castration by means of radiation, and in a few instances, have x-rayed the pituitary gland, but this series has been so small that no deductions can be made at the present time

Treatment of carcinoma of the breast In order to evaluate the results of treatment in carcinoma of the breast, an arbitrary grouping has been chosen

GROUP I Lesion confined to the breast alone with no palpable metastases

GROUP II Lesion in the breast with metastases to the axilla

GROUP III Lesion in the breast with metastases to the axilla, supraclavicular, mediastinum or elsewhere

Preoperative radiation in the treatment of cancer of the breast has been used at our institution since the fall of 1934 with a few exceptions Previous to that time our preoperative radiation as it is known today was very inadequate consisting of 320 r placed on the anterior chest wall endeavoring to cover the breast, axilla, and the supraclavicular region, after which surgery was performed In a small series of cases such as this extending over a period of one or two years only a preliminary report can be made However, we have included three previous cases, one from December 1930, one from December 1933, and one from June 1934 We are using preoperative radiation with the hope that our five-year cures in cancer of the breast especially in Groups II and III will be increased This method may have less merit in Group I, as it has been the experience in most clinics that a five-year cure can be effected by surgery alone in seventy-two to eighty per cent of the cases Group II with metastases to the axilla is the group that we are endeavoring to help as they represent an urgent problem The method now being used is to attempt whenever possible to establish a definite diagnosis by one of the methods mentioned before Then x-ray is applied to the anterior chest wall over a large field about twenty-seven by twenty-seven cm Daily increments of 280 r measured in air or 420 r tissue scattering are given on seven successive days covering the anterior chest wall overlapping the supraclavicular and axillary regions A daily increment of 320 r air and 480 r tissue scattering is administered for three days posteriorly over a field usually ten by fifteen cm This makes a total of 1960 r in air on the anterior chest, 960 r air scattering, and 1440 r tissue scattering on the posterior chest This will cause tanning with desquamation of the skin on the anterior chest wall, also marked desquamation and temporary damage to the skin in the axilla. A healing takes place in about eight or twelve weeks depending upon the human equation and it is at this time that the patient is subjected to a radical mastectomy

There are some arguments against preoperative radiation, namely, the anxiety of the patient in the anticipation of a future operation and the symptoms caused by x-ray reaction on the skin—the itching, burning, and discomfort Operating time is generally increased, more bleeding encountered during the operation, and more fibrosis found in the axilla making the dissection of the axilla more difficult. Postoperative oozing is increased if all the vessels are not carefully ligated

Preoperative radiation, however, has beneficial effects, namely, that it seals off the lymphatics causing fibrosis of the tumor and in some instances causes total disappearance of the tumor Preoperative radiation is given with the idea of increasing our five-year cures Many clinics have reported their results from surgery alone, surgery plus postoperative radiation, and a few have reported on preoperative radiation followed by surgery

A more concise idea of what we have obtained in a small series of cases to date can be illustrated according to groups

Group I Seven cases, all females, between the ages of fifty and seventy, all married The right breast was affected in three instances and the left in four All tumors were discovered by the patients themselves and not one of these cases appeared at the doctor's office for periodic checkup to enable the doctor to discover the lump The first symptom of which these patients complained was the lump, later associated with pain Two complained of a bloody discharge from the nipple, one having extended intermittently over a period of twelve years until the tumor finally made its appearance. The size of

the tumors varied from two to five cm in diameter In one instance the entire breast was involved The average duration of the tumor was twenty-five months Four patients had positive sections by means of needle puncture and three were clinically considered cancer, proved later on by operation The time elapsed between radiation and surgery was from one to ten months, averaging five months The reason for delay in some instances was that the patient refused surgery when the tumor began to regress or the Radiation Department was reluctant to refer some of these cases for surgery Radical surgery was performed on every patient except one elderly lady whose physical condition did not warrant such a radical procedure. Only one tumor which was proved cancer before therapy had entirely disappeared following radiation The pathologist stated that the breast showed no evidence of malignancy but had been replaced by mastitis Six of these patients are clinically well from eight to nineteen months One is at the present time suffering from a recurrence in the scar

Group II Twenty-eight patients, all females except one, ranging in age from thirty-six to seventy-three, all married but four The right breast was involved in fourteen instances and the left in fourteen Again as in Group I all of the lumps were discovered by the patients themselves and not by the physician The lump was the first symptom of which the patient complained with two exceptions in which the patients suffered from pain for two years and five months respectively before the appearance of the tumor An interesting fact concerning this group is that in twenty-three cases the upper outer quadrant of the breast was involved, the upper inner quadrant in one, the lower inner in two, and the entire breast in two cases The tumors ranged from about one cm in diameter to the entire breast. Average duration of the lump was nine months All of these patients presented palpable axillary nodes Sections from the nodes before preoperative therapy were not made and in ten instances following removal of the breast, nodes were found but were not malignant A positive preoperative pathological diagnosis was made in eighteen cases An unsuccessful attempt was made in the remainder, yet clinically they appeared malignant which was proved following removal of the breast The time elapsed between radiation and surgery was from two months to five years and five months, averaging seven months Radical operation was performed in twenty-six cases and simple mastectomy in two Twenty-six patients were operated for palliative purposes and two as hygienic measures Four tumors were sterilized, there being no evidence of cancer in the breast upon removal yet a positive section was obtained before preoperative therapy was instituted. Ten cases showed no evidence of metastatic carcinoma in the glands of the axilla following surgery and one showed metastatic carcinoma in the axilla but no malignancy was found in the breast. The results in this group are three are dead One had an infected ulceration due to interstitial and external radiation, the operation being performed to rid the patient of infection but she died from postoperative pneumonia One died six months following surgery with multiple metastases and the other died from metastases to the umbilicus One patient at the present time is suffering from multiple skin metastases The rest remain clinically well of their disease from five months to two years The one male patient had a partial resection of the breast for a carcinoma He developed a prompt recurrence and was sent to this clinic where he received preoperative radiation followed by radical mastectomy Some difficulty was encountered in healing the skin edges but at the present time there is no evidence of recurrence and he has been clinically well for one year

Group III Ten patients, all females, averaging in age from thirty-three to seventy-nine, all married except one In four cases the tumor was found in the right breast and six in the left. Again, as in the previous groups, all the lumps were discovered by the patient, the average duration of the lump being nine months The location of the tumor was about evenly distributed in all quadrants of the breast. The size of the tumor was from three cm to involvement of the entire breast. Of course, in this group, not only the axillary nodes were involved but also the supraclavicular Eight positive sections were obtained before radiation and two were clinically considered cancer The time elapsed between preoperative radiation and surgery varied from one to seventeen months, averaging six months Six of the operations performed were radical and four were simple Seven were done for hygienic reasons and three with an endeavor to obtain a palliation The results in this group of course are not quite so gratifying in that recurrences were discovered in five cases, one patient died in ten months from lung metastases, one died in one year, one was lost trace of, and another died in eighteen days from pneumonia following removal of

an ulcerating, infected breast. She had received a large amount of radiation which resulted in considerable scarring, telangiectasis, and ulceration necessitating amputation of the breast for hygienic purposes One patient developed a tumor in the opposite breast which was clinically diagnosed carcinoma but no biopsy was performed to substantiate this belief The lesion was treated by x-ray and has apparently disappeared To date she is clinically well The rest of these patients have received palliation from one year and seven months to three years and five months

There are many deductions that can be made from this small group of cases First, there is surely a need of cancer education among the lay people They should be taught how to palpate their breasts and if a lump or any abnormality is discovered to visit their family physician immediately Periodic physical examination should be stressed as a prophylactic measure This study reveals that in none of these cases was the lump discovered by a physician Lay education properly conducted will be a great influence in persuading patients with lumps in the breast to visit their family physicians earlier

This small series of cases proves very little as far as recognized five-year clinical results are concerned However, by instituting preoperative radiation we had the good fortune of converting breasts definitely containing cancer to a benign state Our figures show a slightly higher than nine percent successful destruction of the tumor by preoperative radiation which we realize is somewhat lower than has been reported elsewhere Perhaps preoperative radiation is not the solution for obtaining the best results in carcinoma of the breast but we have decided to continue this practice and at some future time will report our five-year results

113 High St

CLINICS FOR NEWLYWEDS

Approximately 100 premarital and marital clinics in the United States today are performing an invaluable personal and social service in ironing out the difficulties and perplexities that confront young married couples, according to Dr Rachelle S Yarros, Executive Secretary of the Illinois Social Hygiene League, writing in *Health and Hygiene*

Most of the young people who visit these clinics come for information concerning sex problems and birth control, according to Dr Yarros Referring to the work of the League's clinic in Chicago, Dr Yarros says "The premarital group came primarily for scientific contraceptive information as a preparation for marriage Some of the more sophisticated came a few weeks or months before marriage, but most of them came only a week or a few days prior to the date of marriage The majority were referred to the League by physicians, clergymen, social workers, nurses, and other patients Most of the applicants knew something about birth control devices, and many of them, even the least educated, had talked over the matter of contraception with their fiances Indeed, not a small number had been urged by their fiances to seek the information Many of the young women brought their fiances with them either for the first interview or for a subsequent interview, which usually took place about a month after marriage"

JUVENILE TUBERCULOSIS CONFERENCE

The Tuberculosis Sanatorium Conference of Metropolitan New York held a Clinical Session on Chronic Pulmonary Diseases on December 15 at the Cornell University Medical College Amphitheatre. The program, with Edgar Mayer, M D, chairman, presiding, included a symposium on "Pulmonary Tuberculosis in Children" The speakers were Robert A Moore, M D, Assistant Professor of Pathology, Cornell University Medical College, Edith M Lincoln, M D, Assistant Professor of Pediatrics, New York University College of Medicine, and F Maurice McPhedran, M D, Director, Research Department of Respiratory Diseases, Germantown Dispensary and Hospital, Philadelphia, Pa. Discussion was opened by Bela Schick, M D, Director of the Pediatric Division, Sea View Hospital, Brooklyn

POLYCYTHEMIA VERA

Report of Fourteen cases treated with Acetylphenylhydrazine

KENNETH R MCALPIN, M D and KATHERINE EDSALL SMITH, B S
New York City
From the Department of Medicine, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital

Four years ago we reported our results in treating ten cases of polycythemia vera with phenylhydrazine[1] While our paper was still in press, Stone and his associates[2] published an article advocating the use of acetylphenylhydrazine instead of phenylhydrazine hydrochloride Stone's scholarly work convinced us that the acetylphenylhydrazine had certain advantages over the preparation formerly employed, so we decided to give it a trial We now report our results in treating fourteen patients, four of whom were discussed in our former paper We mention them again because they afford an excellent opportunity to compare the effect of the two preparations

Table I records the essential physical signs, symptoms, as well as the first, last, and lowest hemoglobins and red cell counts with a single leukocyte count The weight is omitted as it is frequently misleading Patients may lose because of a variety of reasons, none directly due to the disease, for example, three patients had peptic ulcer, and at least four restricted their diet because of obesity

Case Reports

The histories are limited to the outstanding and important facts and made as brief as possible

CASE 1 Mrs C B, an American woman of fifty-two, office nurse—splendid example of mild erythremia—formerly given phenylhydrazine hydrochloride for three and a half years Before treatment, hemoglobin 138%, red blood cells 7,800,000, leukocytes 13,500 Except for one short bout of jaundice, due to an excess of the drug, she did well Since changing to the acetylphenylhydrazine, there has been no such trouble and only the smallest doses—0 1 to 0.3 gm a month—have been necessary She consumed only 5 3 gm in almost three years Without the medication her red cells tend upward and she has headaches Her only worry now is obesity!

CASE 2 Mrs Y, an Armenian housewife, did well under treatment for about a year Then the liver became large, hard, and tender She failed rapidly, developed fluid in chest and abdomen, jaundice, became comatose, and in spite of treatment, died fifteen days after admission

Liver function test Forty-five per cent retention of bromsulphonephthalein, Blood phosphatase 11 4 (Bodansky units), Euglobin 1 1

Blood chemistry Total protein 6 2, Nonprotein nitrogen 48, Serum bilirubin (6 days after admission) 2 mg %, (a few days before death) 5 6 mg %

Had phenylhydrazine any bearing on final illness? The enlargement of the liver in six months certainly suggested cirrhosis —one of the things one fears when using phenylhydrazine—but results have shown that the liver is rarely injured It must be remembered that these patients often have cirrhosis *without* any medication

ANATOMICAL DIAGNOSIS (Autopsy by Dr Self)
Polycythemia vera
Splenomegaly
Extramedullary erythopoesis—spleen
Thrombosis of hepatic vein—old and recent
Central necrosis of liver
Ascites
Hydrothorax—right
Fibrous peritoneal adhesions
Arteriosclerosis of aorta—mild
Fibromyomata of uterus
Adenomata of liver

Final note (Dr A. M Pappenheimer) Splenomegaly and thrombosis of the branches of central veins followed by ascites Many of the thrombi show early organization and are associated with edema and fibrous thickening of the vein walls They amply explain the central hemorrhagic necrosis of liver lobules, and make unnecessary the assumption of a toxic action of acetylphenylhydrazine.

CASE 3 A H, Swedish woman, age seventy, was first admitted seven years ago Came into the wards six times and visited

Read at the Annual Meeting of the Medical Society of the State of New York Rochester, May 26, 1937

TABLE I—FOURTEEN PATIENTS WITH POLYCYTHEMIA VERA TREATED WITH ACETYLPHENYLHYDRAZINE

Case No	Age	Sex	Race	Occupation	Chief complaint	Spleen	Hemoglobin		RBC		WBC	Acetylphenylhydrazine		Complication	Result
							First	Lowest	First	Lowest	Last		Amount given grams	Duration of treatment months

*Old patient. ** Costal margin

the clinic between admissions when possible. During her course she had several phlebotomies with temporary relief and splenic extract which had no apparent effect. She responded well to acetylphenylhydrazine when she took it regularly, but because of economic difficulties, her visits became all too few. She suffered from many ailments besides erythremia—advanced cardiac disease including aortic stenosis, arteriosclerosis, and towards the last, large ulcers of the legs. Necropsy revealed gastric ulcers. During life, this condition was suspected but never proved. The severity of leg ulcers may well have been the cause of this apparent oversight. While under our immediate care for almost two years, she complained only of her legs. When admitted for the last time she was semi comatose, temperature of 105° F and far too ill for any exhaustive study. She died five days after admission. Death was thought to be due to erysipelas, coronary occlusion, and possible cerebral accident. Necropsy revealed no cerebral hemorrhage.

ANATOMICAL DIAGNOSIS (Autopsy by Dr Keim)

Polycythemia vera
Splenomegaly
Thrombosis of coronary artery, anterior descending branch of left—organized
Infarct of heart—left ventricle—healed
Thrombosis of common iliac artery—left
Thrombosis of external iliac vein—left
Pulmonary embolism
Infarct of lung—R.L.L
Varicose ulcer—left leg
Erysipelas—left leg
Abscess of left cheek—staphylococcus aureus
Acute bacterial endocarditis—aortic valve—organism unknown
Calcification of aortic valve
Aortic stenosis
Cardiac hypertrophy
Ulcers of stomach—acute
Generalized arteriosclerosis—mild
Medial calcification of aorta
Tuberculosis of lung—R U.L
Tuberculosis of lymph nodes (tracheobronchial obsolete)
Chronic blepharitis—bilateral
Adenoma of parathyroid gland
Congenital malformation of kidneys (double pelvis)
Congenital malformation of aorta (anomalous origin of left inferior thyroid artery)
Congenital malformations of heart
(Patent foramen ovale)
(Anomalous distribution of coronary arteries)

Final note (Dr A. M Pappenheimer) Death finally resulted from infection of her varicose ulcers and probably as a contributory factor, from coronary occlusion with fibrosis. This occlusion may have followed a thrombosis not dependent upon sclerosis of the wall, but a part of the general tendency to thrombosis which was evident in this case.

CASE 4 Dr "X", a Jewish dentist of thirty-nine years, went to the Neurological Institute because of "fits" The neurologist found, among other symptoms, personality changes, defects in memory, and loss of libido They sent him to us because of the blood count. He seemed to be a neurological rather than a hematological problem, but because of the erythremia we prescribed phenylhydrazine. As the red cells went down, he improved, the convulsions became less frequent—from one every day or two, to only one a month After two years, because of epilepsy, we sent him to Dr Geyelin, who found the blood uric acid high (6 0 mg per 100 c.c) On questioning, the patient recalled several severe attacks of pain, limited to the great toe. Hence we made the diagnosis of gout.

Although he improved and was able to follow his profession, the loss of sexual power remained unchanged. It may be assumed that the erythremia is not wholly responsible for the epilepsy but probably is a contributing factor

CASE 5 Miss O'C presented the picture so often seen of innumerable minor symptoms She did well and probably would have continued to improve but she left the city She had the highest red cell count (11,700,000) of any patient in this group The erythrocytes dropped to 5,400,000 after exactly two months, during which time she took three gm of acetylphenylhydrazine. The improvement in her general health paralleled the blood picture

CASE 6 A B, a Jewish salesman, aged thirty-nine, came into the general medical clinic July 13, 1933, complaining of asthma and severe dyspnea of seventeen years duration After a routine work-up, he went to the Asthma Clinic, where Dr Stevens thought the cyanosis out of all proportion to the signs of asthma and suggested hospitalization The patient refused and came to us because of high red cell count (R.B C 8,300,000, Hgb 150%)

On July 24, 1935, without enthusiasm, we prescribed acetylphenylhydrazine, at first 0 1 gm a day, four times a week, with weekly blood counts, the most given in seven days was 0 6 gm For five weeks his condition did not change Then after a drop of a million red cells, he felt better In five months we ordered 8.2 gm of the drug but he probably took considerably less

On December 20, he had a cerebral accident, affecting his left hand, left leg, and right eye. After unavoidable delay he entered the ward on February 10, 1936 with temperature 101, pulse eighty, respiration twenty-two, blood pressure 110/70 He was extremely cyanotic and clouded mentally, eyes exophthalmic, mucous membrane congested Thyroid not enlarged *Chest* marked emphysema, respiration limited, breath sounds faint, rales at both bases, expiration prolonged *Heart* right border six cm to right of sternum, left border four cm to left of nipple line. The sounds were of fair quality and regular rhythm The liver came down four cm below costal margin, the spleen not palpable and indeed was felt on only one occasion Venous pressure 165 mm Blood nonprotein nitrogen fifty-one Wassermann negative Plasma CO_2 seventy-seven per cent. Urine normal Film of chest showed mottling of both lung fields, and large heart Electrocardiogram suggested poor heart muscle function He responded to oxygen, but on the second day, developed a right hemiplegia and died in eight days, death apparently due to a thrombosis of the left brachial artery Autopsy was not permitted.

This man probably had Ayerza's disease. Of this uncommon condition Harrop[3] says "The clinical picture is one of chronic cyanosis, of varying but often extreme degree, usually associated with pulmonary emphysema, and with evidence of dilation and hypertrophy of the right heart. The patient often gives a history of attacks of asthma or bronchitis extending over many years and has marked dyspnea on exertion The cyanosis and the pulmonary symptoms may be of very long standing, as well as the dyspnea, before evidences of heart failure appear"

Cheney[4] has discussed several of these cases in considerable detail He, however took the position that in addition to the cardiac and pulmonary lesions, the patient always had syphilis—a radical view and one which would tend to limit considerably the diagnosis of an already rare disease Barker[5] questions Cheney's conclusion and reports a case similar to ours Barker's patient improved on phenylhydrazine We, therefore, assume that we did our patient no harm However, we readily admit that Ayerza's disease must be considered a secondary form of erythremia and hence, phenylhydrazine, if used, must be administered with care

CASE 7 J W, a Jewish painter of sixty-nine, suffered from a long list of ailments The surgeons removed his right eye for glaucoma, his prostate because of benign hypertrophy, and a basal cell epithelioma from his forehead The physicians made the following diagnoses nephritis with

hypertension (blood pressure up to 250/140), myocardial and valvular disease of the heart, duodenal ulcer We cautiously prescribed phenylhydrazine in July 1934 In two months he received 1 6 gm and no more since then Hemoglobin dropped from 135 to 128 per cent and red cells from 9,800,000 to 7,700,000 He showed no ill effects, but stopped coming regularly—we saw him occasionally until January 1, 1936 At that time, he came into the ward because of a severe hemoptysis X-ray of gastrointestinal tract showed a duodenal ulcer Hemoglobin 143%, red blood cells 7,700,000 He made a surprisingly good recovery and went home In two months, his hemoglobin fell to 116% with 8,100,000 red cells—a strange picture, doubtless due to loss of blood But stranger far, was the next blood count with hemoglobin of only sixty-seven per cent and red cells 4,700,000 Aside from weakness, he had no complaints His appearance suggested a patient on the verge of cardiac decompensation and we treated him accordingly He has improved and gets along fairly well if he avoids all exertion There have been no symptoms or signs pointing to the duodenal ulcer and he was not aware of any bleeding

This record shows what may happen in erythremia without treatment The medication certainly had nothing to do with the drop in red blood cells

CASE 8 M G, Hungarian Jew, was treated for four years with phenylhydrazine hydrochloride before we started the present course three years ago At first he required large doses of phenylhydrazine hydrochloride—three to four gm a month At present two gm a month suffice to keep his red cells within normal limits We think the smaller dosage is due rather to the new preparation than to any change in his tolerance. He was jaundiced once when taking the hydrochloride but not since taking the acetylphenylhydrazine

CASE 9 Prof F is known to have had the disease for about eighteen years This man has tried every form of treatment and we gave him from two to four gm of phenylhydrazine hydrochloride a month for three years Now he requires only 1 5 gm of the acetyl in the same length of time

While under observation he had several attacks of gout The low point of seventy-eight per cent hemoglobin and 2,900,000 red cells may have been due to the fact that he was also taking colchicum for his gout. We think it possible that the two drugs acted very drastically on the red cells He was only taking 1 2 gm of acetylphenylhydrazine a month at the time The red cells and hemoglobin returned to normal within a month and symptoms of slight cerebral anemia lasted only for a few days At present he is active and far better than formerly but not quite up to academic duties

CASE 10 S A, a Turk of sixty-two years, was treated with phenylhydrazine hydrochloride for 2½ years prior to beginning the present course. His chief complaint for some time has been arthritis He responds well to acetylphenylhydrazine and needs much less than he did of the hydrochloride The spleen is larger, sometimes fourteen cm below the costal margin As a rule his red cells average around 6,000,000 and his hemoglobin around 110 per cent. At this level he experiences no symptoms referable to erythremia

CASE 11 J R is a Russian Jew of sixty-three years Besides erythremia, he has duodenal ulcer, arteriosclerosis, and chronic sinusitis By far the most important condition is the duodenal ulcer At present his chief complaint is abdominal pain, which does not respond to treatment or diet He never required more than 2 3 gm a month of acetylphenylhydrazine, he has had none for eight months, and still his red cells continue to go down This drop is undoubtedly due to his ulcer, although there has never been any evidence of bleeding He is the third patient in these series with peptic ulcer

CASE 12 E S, an American Jew, came to the clinic because of urticaria It is, of course, doubtful if the allergic tendency has any connection with the blood He does well on moderate doses of acetylphenylhydrazine—from 0 5 to 0 8 gm a month keeps his red cells near normal Obesity has always been a real threat and he is one of those who has to exercise constant care about his diet.

CASE 13 E McL is a successful business man of fifty-six with only slight elevation of red cells We consider his record important because of his susceptibility to acetylphenylhydrazine This reaction to the drug may be due to the fact that eight years ago, Dr J Bentley Squier removed his right kidney (tuberculous pyonephrosis) The first blood count showed only slight elevation in red blood cells The following week, however, they were 7,200,000 and hemoglobin 120 per cent He complained chiefly of "mental fatigue and grogginess" The leukocytes, low at first, usually averaged 11,000 to 13,000, reaching as high as 19,000 on one occasion The spleen could never be palpated but absence of splenomegaly does not, of course, exclude the disease

We ordered the usual initial dose of 0 1 gm a day for three successive days After three doses he felt better but the red cells went up instead of down The second week he took 0.2 gm for a total of 0 5 gm in twelve days—certainly not an excessive amount. At this time he complained of feeling "achey," chilly and feverish—thought he was "catching cold" No physical signs could be found but he did have a temperature of 99 6° He went home and took 0 1 gm and returned in three days saying that he felt worse and had fever every afternoon Temperature at that time was 100° by mouth This subsided and after three days he felt perfectly well (hemoglobin 88%, red cells 5,000,000) Six weeks after this episode he again took 0 1 gm of acetylphenylhydrazine and within six hours shot a chill, followed by a temperature of 101° In all, he had taken 0 7 gm of the drug and we decided that that was plenty! With no medication, on a diet consisting chiefly of vegetables, milk, eggs, and fruit, he has thrived —plays golf, paddle tennis, swims, and dances without the least fatigue

Case 14 Prof J R. McG, a patient of Dr T L Tyson (to whom we are indebted for this record), complained of fatigue and dizziness His symptoms had incapacitated him for a year Rest and travel did not help He was given 0.2 gm a week, then 0 2 gm every two weeks and now he takes only 0 1 gm every three weeks Although red cells 4,700,000 and hemoglobin seventy-seven per cent are a little low, at this level he feels splendidly and is able to keep up with a stiff academic schedule. Sometimes, after taking the drug he feels chilly but has never noted any fever This suggests the more severe reaction of case 13 To avoid any ill effects of the medication he takes the drug during the week-end when he can rest without curtailing his professional activities

Technic

When constantly doing hemoglobin determinations, a simple and reasonably reliable method becomes necessary For years we have used the Sahli (standardized 100% to 14 9 gm hemoglobin) The modern trend is towards making all reports in grams of hemoglobin, and our reason for not changing is the confusion that would result in our records

In all of our work two standardized pipettes are used for each determination of hemoglobin or blood count.

Discussion

Although this paper deals with therapy, a few words about diagnosis may be permitted In 1921, Weber[6] divided all polycythemias into three classes

1 Relative, due to concentration of the blood

2 Secondary due to high altitude, cardiac or pulmonary disease, blood stasis, caused by chronic disease, poisoning, etc

3 True erythremia with unknown etiology

When so little is known about a disease it behooves us to be cautious in making rules for diagnosis The consensus of opinion, however, suggests three points to bear in mind (1) High red count, (2) leukocytosis, (3) palpable spleen

Of our fourteen patients, only three failed to meet these requirements True, some of our old patients show only a moderate increase in red cells, but this is due to a former course of treatment

Case 6 had neither leukocytosis or palpable spleen He therefore failed in two out of three counts This is important as he probably had Ayerza's disease

Two other patients (13 and 14) did not have enlarged spleens and both may be considered relatively early cases Although we expect to find a palpable spleen, it is absent in a small proportion of cases probably the early, or less severe Furthermore, neither of these men had leukocytosis at first but in both it appeared later A high count seems to depend rather on the severity of the process than the therapy

Six of our patients were Jews, we also had one Turk and one Armenian Retznikoff[7] has already called attention to the large number of Hebrews subject to erythremia. Two were painters and two were plumbers Before considering lead poisoning as an etiological factor, we hasten to say that these patients were also Jews

Three patients, two of whom were Jewish, had peptic ulcer The literature contains a wealth of speculation as to the relationship between ulcers and erythremia. (Recent contributors include Boyd[8] and Kraemer and Asher[9])

Our patients react quite differently to their intestinal lesions One after a single hemorrhage had no symptoms directly referable to the ulcer, one man suffers constantly in spite of diet, drugs, and rest, while the diagnosis in the case of the third patient was only made at necropsy

To successfully catalogue *all* of the complaints of these patients is impossible, but certain symptoms cannot be overlooked For example, vertigo, headache, and pain in the extremities, are almost always present. Sometimes the discomfort is hard to describe and we hear such terms as "mental fatigue," "heaviness in the head," and "uncertainty" The patients fear that they may fall, but rarely do so, they dread coming to the hospital lest they lose their way, but generally get back and forth with only slight delay

The pain in the feet and toes is often severe, with nothing but the patients word to show for it, no redness, swelling, or anything demonstrable with roentgen ray This pain should not be confused with arthritis, gout, or thrombosed vessels There may, of course, be small thrombi but they cannot be demonstrated Perhaps it is due to changes in the arteries as described by Retznikoff,[7] or chronic congestion in the smaller vessels may account for it Often worse in winter, suggesting chilblains, but wool socks and warmer weather are by no means always curative This pain will certainly test the therapeutic ingenuity of the physician

One of our patients had arthritis in the joints of the feet and two had gout Weber,[11] from his wealth of experience, says that gout occurs "not infrequently" in polycythemia We wonder if that is true in this country because Davis[10] reported a case but could find no references in the literature

Insomnia can also cause a lot of trouble Many of our patients are "nervous" but only one (case 4) has evidence of an organic neurological condition Patients with polycythemia must be constantly watched for evidence of mental disturbances Concerning this the literature affords considerable diversity of opinion Adams[14] takes the broad, general view of the medical man, impressed with the numerous "nervous manifestations" seen in the study of nine cases Levin,[15] a psychiatrist, reports a case of psychosis due, he thinks, to erythremia He believes mental disorders are rare in this disease Winkelman and Burns[16] agree that nervous diseases are the exception in polycythemia They report two cases, one of which showed, at necropsy, a condition of the cerebral vessels sufficient to have caused "neuropsychiatric features"

Treatment

The literature is replete with reports about phenylhydrazine (usually the hydrochloride) Some observers have found it toxic and report instances where the results were unfortunate All agree that the drug is far from harmless but, not dangerous with proper supervision Eggleston and Weiss[12] give an excellent survey of the whole subject

We start our patients on 0 1 gm of the acetylphenylhydrazine once a day for two or three successive days A blood count is done once a week We like a rest period before examining the blood because we get a better opportunity to study the effect There is no rule to govern the amount required The only safe method is to continue for three or four weeks without changing the dosage, then, if necessary, gradually increase to 0 4, 0 5, or rarely to 0 6 gm a week When there is *any* drop in the erythrocytes and hemoglobin, the drug should be stopped at once for a week, then given again if the red cells have not decreased more than 1–200,000, too great a drop contraindicates therapy for several weeks, or until regeneration appears After a time, the individual tolerance of each patient becomes apparent There is undoubtedly an accumulative effect, often hard to estimate This may be helpful when properly understood, but when disregarded may cause trouble. To state our case so simply would seem to indicate that after a month or so the problem of each individual is satisfactorily solved This is far from true What usually happens is that the patient has a satisfactory drop in red cells and the dosage is reduced, maybe stopped altogether The patient feels splendidly and goes his way for a week or two

Meantime, the red cells and hemoglobin have shot up rapidly The chart of the red cells of a patient taking phenylhydrazine often strongly resembles an old-fashioned cross-cut saw The best way to avoid this is to proceed cautiously and keep on the low side of the patient's tolerance

After observation, an intelligent and cooperative patient need not be seen more than once a month It should be a rule never to let anyone take phenylhydrazine, except in the smallest amounts, without a monthly blood count Sometimes, as little as 0 1 gm every two weeks, will prevent a sudden rise

Danger signs

Any form of phenylhydrazine must be used with care but most of the ill effects reported were caused by the phenylhydrazine hydrochloride We have noticed much less jaundice since using the acetylphenylhydrazine (only one case) This is significant because three of our four old patients (1, 8, and 10) all became jaundiced when taking the hydrochloride

Jaundice, gastrointestinal disturbance, and a sudden drop in red cells are among the danger signals There also appears to be a real susceptibility which may be characterized by fever but no jaundice (cases 13 and 14)

We try to keep the red cells near normal but undoubtedly some individuals do better with the erythrocytes higher or lower than the usual figure With so much still to be learned about this disease, we hesitate to give so potent a drug except when the patient has real discomfort, hence regardless of the blood picture, we treat only those who have symptoms Once we have started therapy we continue it as long as necessary Long remissions do occur but whether these are due to treatment or the course of the disease, it is impossible to tell

Some patients with erythremia develop anemia, usually late in the disease Rarely this phase is accompanied with the well-known but rare leukemic blood picture, which has nothing to do with therapy The anemia may, of course, be the result of some intercurrent disease such as nephritis, peptic ulcer, or cirrhosis of the liver With this knowledge in mind, we wonder if frequent bleeding may not sometimes be accompanied by unfortunate results Stephens and Kaltreider[13] have recently found phlebotomy most successful and this method is without doubt useful when phenylhydrazine is contraindicated At best we are dealing with an incurable, obstinate disease and the odds are against us, so that any therapeutic agent must be powerful Our observations indicate that the acetylphenylhydrazine is far less toxic and more efficacious than the phenylhydrazine hydrochloride

Results

Nine patients were improved
Two patients were not improved
Three patients died

Unimproved The two men that were not improved were both over sixty years old and had peptic ulcers

Deaths Case 2 had a ward diagnosis of cirrhosis of the liver, cholemia, and cerebral accident Necropsy showed central cirrhosis of the liver, fibrous peritoneal adhesions, and slight arteriosclerosis of the aorta (Examination of the head not allowed) Dr Pappenheimer did not think the cirrhosis resulted from the drug

Case 3 was seventy years old Death followed a number of serious conditions among them extensive infection of varicose veins, erysipelas, and a partially occluded coronary artery Nothing was found on postmortem to indicate any toxic effect of phenylhydrazine

Case 6 probably had Ayerza's disease—a condition for which little can be done therapeutically We may have erred in using the drug but similar cases have been benefitted by phenylhydrazine Necropsy was not allowed

Summary

1 Fourteen cases of polycythemia were treated with acetyphenylhydrazine

2 Nine cases were helped, two others helped only temporarily (both had peptic ulcer), and three died Two necropsies did not indicate toxicity of drug The other patient probably had Ayerza's disease, postmortem was refused

3 One patient became jaundiced Two showed a susceptibility to the drug, in usual doses

4 From this series we feel justified in believing that the acetylphenylhydrazine is probably more effective and certainly less toxic than the phenylhydrazine hydrochloride

Discussion

DR. D J STEPHENS, *Rochester*—In attempting to control the symptoms of polycythemia, two general types of therapeutic approach have been considered One of these is to attempt to alter the fundamental pathology of the disease, namely the bone-marrow overactivity, which is presumably on the basis of anoxemia With the possible exception of the production of an iron deficiency state, attempts to influence the bone-marrow directly have been disappointing Increasing the amount of oxygen in the inspired air, limitations of iron and proteins in the diet, the use of Fowler's solution, and the repeated aspiration of the gastric contents in an attempt to limit hematopoiesis have not been sufficiently successful to warrant general acceptance as therapeutic measures The second approach has been palliative in nature, directed at the reduction (by chemical or mechanical means) of the number of circulating erythrocytes and therefore of the hematocrit, blood viscosity, and blood volume—increases in which are responsible for the symptoms and signs of the disease The most popular method of treatment has employed one of the phenlyhydrazine preparations, whose action depends on destruction of erythrocytes by hemolysis In the hands of those who are familiar with the dangers and limitations of the drug, many cases of polycythemia may be satisfactorily controlled for periods of many years by this means, as Dr McAlpin has demonstrated There is, however, a certain number of patients in whom the phenylhydrazine preparations cannot or should not be used—those patients who are elderly or who have had vascular thromboses, those who do not tolerate the drug, and those in whom it is ineffective for one reason or another It is in such patients, in particular, that we have been interested in studying the effect of systematic venesection Dr Kaltreider and I have been able to confirm the observations of Reimann and Breuer, in Germany, to the effect that venesection, repeated at frequent intervals until the hematocrit reaches a normal or subnormal level, results in prolonged hematologic and clinical remissions of from several months to two years or more and apparently does not result in evidences of increased bone-marrow activity We believe that these prolonged remissions are due to the production of a state of relative iron deficiency by the withdrawal from the body of relatively large amounts of iron and other potential blood building materials and perhaps to a temporary inhibition of bone-marrow activity A decrease in cell size usually occurs after repeated venesection and is interpreted as evidence of the production of some degree of iron deficiency It has been demonstrated in both man and the experimental animal that the hemolytic action of a single course of phenylhydrazine is followed by retention of hemoglobin iron within the body, by reticulocytosis, by relatively rapid regeneration of blood, and in some instances, by increase in red cell volume and size In practice these changes are not of great significance because hemolysis may be continued by the administration of small maintenance doses of the drug If I may, I should like to show one slide which may illustrate some of these points This is a patient with polycythemia vera, in whom a remission was induced by means of repeated venesection and which lasted for something over a year before further treatment became necessary The second remission, induced by phenylhydrazine, was followed by a reticulocyte response and by

increase in the hematocrit and blood viscosity to the previous levels within two months I was particularly interested in Dr McAlpin's patients with peptic ulcer, because this patient was unable to take further amounts of phenylhydrazine because of an exacerbation of ulcer symptoms which accompanied the use of the drug This, of course, is not a fair therapeutic comparison because maintenance doses of phenylhydrazine were not continued after the initial period of hemolysis Due to limitations of time and number of patients, we have made no attempt to compare directly the therapeutic efficiency of phenlhydrazine and venesection The point is rather to emphasize the usefulness of venesection as an alternative therapeutic procedure which, contrary to general opinion, seems safe and efficient, and which may be found particularly useful in those patients in whom one hesitates, for one reason or another, to use chemical means of treatment

MEDICAL EXHIBITS AT THE GOLDEN GATE FAIR

In the Hall of Science at San Francisco's 1939 Golden Gate International Exposition, thirty of America's research laboratories will tell the story of the progress made in the prevention and treatment of disease

Led by such institutions as the Mayo Clinic, the Jackson Clinic, the American Medical Association, and the American Society for the Control of Cancer, these laboratories will present a picture of the latest advances in medicine and its related fields The plans will also have the cooperation of the country's leading universities, notably the University of California, Stanford University, the California Institute of Technology, University of Southern California, Harvard University, University of Oregon, and the University of Washington The exhibits will place major emphasis on prevention of disease rather than treatment.

A new and improved model of the transparent man will be shown, particularly emphasizing the digestive apparatus Other material will show the technic attained in plastic surgery Displays showing the prevention and treatment of appendicitis have also been promised and educational exhibits pertaining to diabetes, asthma, and experimental dentistry are contemplated The Mayo Clinic will participate in the cancer exhibit and the embryological exhibit.

The Jackson Clinic of Madison, Wis, will center all its efforts on the story of the thyroid gland This display will show the normal activity of the gland and how it secretes thyroxin Special consideration will be given to the achievement in preventing physical and mental destruction through the impairment of this gland and the importance of iodine in keeping the gland functioning Attention will also be focused on the so-called goiter belt stretching across northern United States, and exhibits will demonstrate the prevention of goiter and cretinism.

Dr Eben J Carey of Marquette University, who was in charge of medical exhibits at the Century of Progress, is heading a group planning an exhibit on embryology, "How Life Begins"

At the University of Wisconsin an exhibit is being prepared to show the modern use of drugs and chemicals to alleviate pain In a cooperative exhibit, University of Wisconsin pharmacologists and anesthetists will collaborate with similar groups from the University of California in a demonstration of modern anesthesia

An unusual cancer exhibit will have the cooperation of the American College of Surgeons and other groups Use of radium, x-ray, and surgical treatment will be demonstrated as well as modern preventive measures

Other important subjects to be covered by the American College of Surgeons include the treatment of bone injury, particularly the new plastic bone surgery Directing the American College of Surgeons activities at the Exposition will be a committee composed of Dr Howard Naffziger of the University of California, president-elect of the association, Dr Frank Lynch, also of the University of California, vice-president, Dr Emile Holman of Stanford, and Dr Malcolm McEachern of Chicago

The story of teeth and their connection with general health will be vividly portrayed in the Hall of Science by the exhibit of the American Dental Association As a central feature of these booths a moving model will demonstrate in a novel way how teeth are formed and grow in the mouth A series of illustrations will also show how apparently healthy teeth can decay and how many dental troubles can be prevented from spreading to other parts of the body, particularly the heart, kidneys, and bones Of especial interest to the layman will be a portrayal of the history of dentistry from its earliest beginnings

PERSISTENT VOMITING IN EARLY LIFE

With Special Reference to Obstructions of the Gastrointestinal Tract

S W CLAUSEN, M D, *Rochester*
Department of Pediatrics, The University of Rochester, School of Medicine and Dentistry

The purpose of this paper is to call attention to the importance of anatomical obstructions of the gastrointestinal tract as a cause of severe vomiting in early life We are not considering at this time the type of transitory vomiting due to acute general disease or acute disorders of the stomach or intestine, but to those types of vomiting which are prolonged or recurrent, and in which large quantities of food are lost For our purpose, an analysis was made of all cases of severe vomiting observed at the Strong Memorial and Rochester Municipal Hospitals in the ten year period ending January 1937 We are presenting in this paper our observations on all the infants, ninety in number, and on the twenty older children considered to have "recurrent" or cyclic vomiting We have excluded the cases of children (all of them over 2 years of age) in whom severe vomiting was due to inflammatory adhesions, recurring appendicitis, and scarring of the esophagus from ingestion of corrosive substances The cases were "selected cases" in the sense that most of them had been referred to the hospital because they had failed to respond to routine therapeutic measures In the study of these patients the pediatric staff enjoyed the active collaboration of the surgical staff Most of the operations were performed by Dr John J Morton

The diagnoses are shown in Table I

The most frequent cause of severe vomiting in the infants was congenital obstruction of the gastrointestinal tract —complete, partial, or intermittent (63 5% proven, 4 5% probable) The next most frequent cause was pylorospasm (23 5%) Errors in feeding were never the sole cause (Table II)

The more frequent causes of severe vomiting in the infants require brief consideration The clinical picture of *pyloric stenosis* is so well-known that only the briefest summary of our twenty-nine cases is necessary Twenty-one of the patients (73%) were boys The vomiting began between the ninth and twenty-seventh day in twenty-four (80%), the average day of onset was the eighteenth Two infants began to vomit on the day of birth Usually the vomiting began as simple regurgitation, but soon acquired great force in all Gastric peristalsis was observed in all cases, a pyloric tumor was palpated in sixty-one per cent. In most of the others, the pylorus was found at operation so completely covered by the liver that it was beyond the reach of palpation Prompt surgical treatment was carried out in twenty-eight infants, one of whom died of massive pulmonary collapse The vomiting ceased promptly after the operation in sixty-five per cent of the cases, slight vomiting continued for a few days in twenty-three per cent, but severe vomiting continued on the average for five days in twelve per cent Two patients ultimately died of uremia, following hydronephrosis An older infant died of pneumonia and starvation because we failed to diagnose pyloric stenosis before the autopsy

Pylorospasm was observed in nineteen infants and in two older children We have taken as our criteria for the diagnosis of pylorospasm, projectile vomiting, gastric peristalsis, the absence of a palpable pyloric tumor, and the relief of symptoms by atropine in large enough dose, by sedatives, or by thick feedings Obviously, we may have included in the series several cases of pyloric stenosis Adequate visualization of the pyloric canal by x-ray would doubtless have improved our diagnosis The fact remains, however, that medical therapeutic measures alone failed to cure—or greatly relieve—the cases in which pyloric ste-

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

nosis was found at operation Among the infants, eleven were boys, eight were girls Vomiting began in six on the first day of life, in one, on the forty-second, the average day of onset was the thirteenth Atropine relieved ten patients, thickened feeding, five, a combination of both, fifteen patients Two patients died of other conditions, two were inadequately observed Ten patients were free of vomiting by four months, and twelve by eight months Nine became perfectly healthy Four had attacks of vomiting at long intervals, three were described as "nervous"

Duodenal obstruction was present in fourteen infants—eight girls and six boys The cause in eleven was hyperfixation by so-called congenital bands, or faults in migration and rotation of the intestine The duodenum was frequently twisted or kinked, in two of this type, internal hernias were found Two infants had occluding diaphragms within the duodenum, one had complete atresia of the third portion of the duodenum Constitutional defects were relatively frequent in cases of duodenal obstruction Other members of the families of three had congenital intestinal obstructions Two of

TABLE II—CONGENITAL OBSTRUCTIONS OF GASTROINTESTINAL TRACT OBSERVED IN A SERIES OF NINETY INFANTS WITH SEVERE VOMITING (CASES OF PYLORIC STENOSIS ARE OMITTED)

Case	Type of Obstruction	Other Significant Anomalies	Treatment	Outcome
1	Tracheoesophageal fistula.		Gastrostomy	Died, age 3½ months
2	Tracheoesophageal fistula.		Gastrostomy	Died, age 30 days
3	Stenosis of esophagus		Dilatation	Died, bronchopneumonia
4	Stenosis of esophagus	Cardiospasm.	Dilatation	Recovery
5	Stenosis of esophagus	Mental retardation	Dilatation at 8–10 years.	Improved
6	Atresia duodenum	Mongolian idiocy	Operation at 2 days.	Died pneumonia, 2 years
7	Diaphragm in duodenum	Alkalosis	Operation	Relief marked, slight vomiting 2 years
8	Diaphragm in duodenum	Cardiospasm Mongolian idiocy	Operation at 14 days.	Relief of vomiting, died, sepsis, 1 month
9	Cystocele duodenal membrane Rotation of duodenum	Cardiospasm. Mental retardation	Operation at 3 months	Relief
10	Hyperfixation duodenum at Treitz ligament	Hare lip. Cleft palate	Operation at 9 days	Died. Shock after operation on mouth at 25 days
11	Hyperfixation of duodenum		Operation at 35 days.	Relief
12	Hyperfixation and torsion of duodenum		Operation at 11 months	Relief
13	Hyperfixation and torsion of duodenum	Entire small intestine not rotated, and retroperitoneal. Alkalosis	Operation at 4 months	Relief
14	Hyperfixation and torsion of duodenum	Cardiospasm.	Operation at 15 days.	Relief
15	Multiple bands obstructing duodenum	Adhesions constricting ileum. Alkalosis	Operation at 4 months	Relief
16	Hyperfixation and angulation of duodenum	Cardiospasm.	Operation at 1 month	For 3 months, periods of vomiting, then relief
17	Rotation of duodenum, multiple obstructions	Redundant sigmoid. Hypospadias	Operations at 11 days, 2 months, 3 months	Relief partial
18	Hyperfixation duodenum	Cardiospasm. Hernia jejunum into lesser peritoneal cavities	Operation at 19 days.	Relief
19	Hyperfixation duodenum	Cardiospasm. Hypospadia.	Operations at 25 days, at 2 months	Relief
20*	Atresia jejunum	Pancreatitis.		Died, 7 days
21*	Atresia jejunum	Fetal peritonitis	Operation at 2 days.	Died, 14 days
22**	Internal diaphragm obstructing ileum	Impacted meconium	Operation at 2 days.	Died
23**	Atresia of large bowel	Impacted meconium	Operation	Died
24	Constriction of colon due to congenital bands	Mongolian idiot	Medical	Relief
25	Multiple congenital bands obstructing ileum		Operation at 15 months	Recovery from vomiting, died, scarlet fever 3 years
26	Volvulus due to malformation of mesentery		Operation at 6 months	Died
27	Hirschsprung's disease		Medical treatment.	Relief from treatment

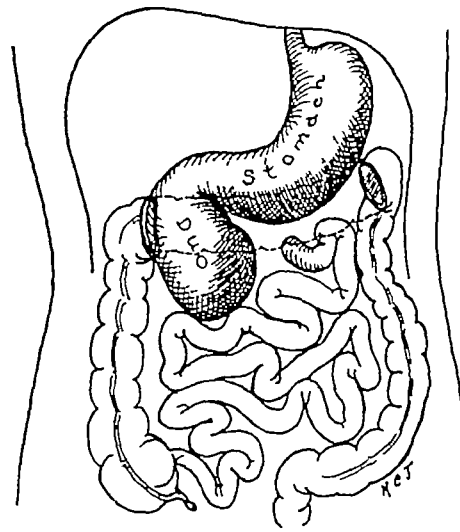

Fig 1 Atresia of duodenum Relief by operation

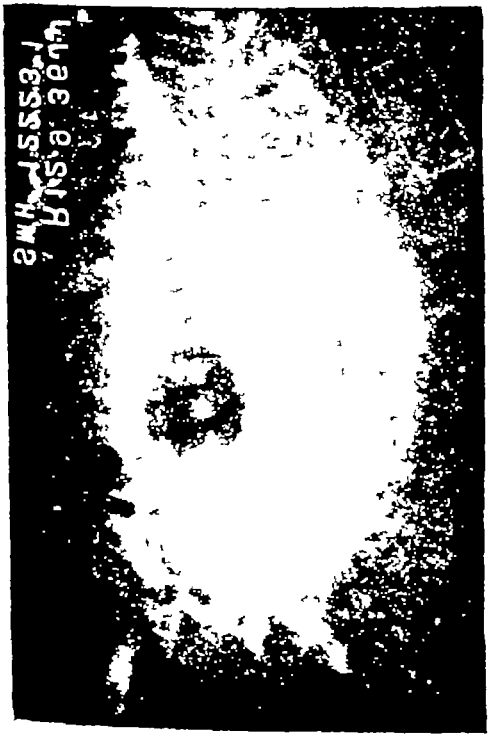
the infants were Mongolian idiots Hypospadias was present in two, cleft palate in one Two of the patients had redundant sigmoids Seven of them had demonstrable cardiospasm One patient was found to be retarded in mental development Another became a stammerer

The vomiting began early, on the first day of life in eleven, on the third, fifth, and ninth in the others All patients vomited with great frequency, and lost a large amount of material The vomitus often contained blood, in three patients, it contained bile The vomiting was "projectile" in ten In the seven patients with cardiospasm, the vomitus at times contained no acid or curds, a circumstance which at first caused great confusion in diagnosis In six patients, the vomiting increased steadily, in four, it was alarming from the first In four, the vomiting was intermittent—at irregular intervals

These latter patients—and some of the others—were treated for long periods of time by changes of formula In most of the cases of duodenal obstruction, fullness was observed in the epigastrium, due to distention of the stomach, in about half of the cases, gastric peristalsis was observed The x-ray plates in cases of partial duodenal obstruction were frequently misinterpreted as showing pyloric obstruction In several, the dilated duodenum was apparent As medical treatment relieved none of these patients, operation was performed in all Following operation, vomiting promptly ceased and did not return in five Severe vomiting continued in nine—for an average of five days, in seven of these infants, slight vomiting was observed from time to time In two, the vomiting steadily increased, a second operation was required in one, and a second and a third in the other, to relieve obstructions below the site of the first operation Six patients are known to have recovered completely, three had occasional vomiting for a year One of the Mongolian idiots —who had had atresia of the duodenum —died of pneumonia at the age of two years The other Mongolian idiot died of septicemia following a skin infection Another infant, relieved of vomiting after operation, died of pulmonary collapse following operation for cleft palate

It is our impression that duodenal obstruction of moderate degree may have been present in four other infants, whose symptoms were intermittent vomiting In fact, the x-ray examination indicated enlargement of the duodenum in three, but the vomiting, although considerable in amount from time to time, did not result in failure to gain, and gradually

stopped in all For this reason, operation was not indicated



Less frequent causes of severe vomiting in infancy Tracheoesophageal fistula occurred in two infants in the series, stenosis without fistula in three, cardiospasm without other evidence of obstruction in one, and cardiospasm with other obstructive lesions in ten The vomiting began early in each case. The vomitus was free of gastric juice. In the cases of fistula, vomiting, choking, and cyanosis occurred with the first attempt at giving water Great caution is necessary in administering radiopaque material to cases suspected of having esophageal obstructions, for the material is liable to enter the lung, barium sulfate should not be used, it is much safer to use skiodan or lipiodol, better yet, to attempt to pass a catheter through the esophagus into the stomach The prognosis of complete obstruction of the esophagus is absolutely bad, even with gastrostomy, because there is usually a communication between the stomach and the lung through the lower end of the esophagus Dr Merle Scott performed transection of the cardia in our cases, with prolongation of life Incomplete obstructions of the esophagus may require dilatation of the esophagus for long periods Cardiospasm associated with obstruction in the duodenum required only occasional feeding by tube

Severe vomiting in the first two weeks of life may be due to some of the causes already mentioned, or to injudicious feeding In five of our cases, the cause was not discovered, and the vomiting ceased abruptly in all

Congenital obstruction below the duodenum was observed in eight cases Two of these patients were cured by operations which relieved obstructions of the large bowel The obstructions in the others included atresias—often multiple—and fetal peritonitis Two infants in one family had internal bands obstructing the terminal ileum, and causing the retention of enormous quantities of meconium of a rubber-like consistency None of the six survived

Rumination was the sole cause of severe vomiting in three neurotic infants

Diagnosis The review of our cases shows that congenital obstruction of the

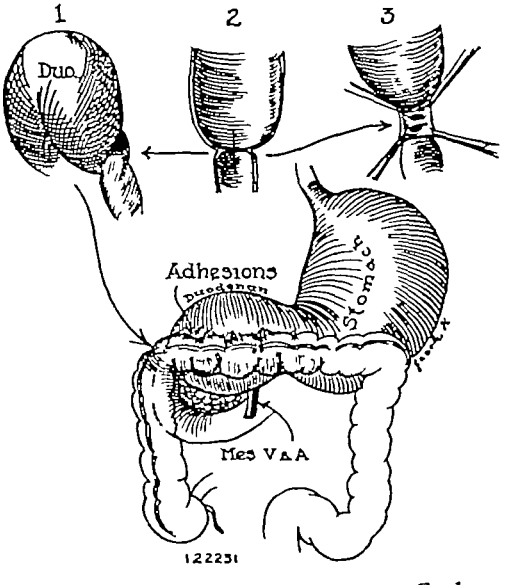


Fig 2 Diaphragm within duodenum. Cardiospasm Cure.

intestinal tract is a frequent cause of severe vomiting in infants, and should be suspected whenever the vomiting is not relieved by correction of errors in diet The majority of these infants cannot be cured without surgical treatment Exact diagnosis is important before operation The type of vomiting often gives most important diagnostic information Choking, cyanosis, and regurgitation through the mouth and nose immediately after

Fig 3 Duodenal obstruction due to construction by peritoneal bands Cardiospasm Operation—Cure.

feeding indicate that food has entered the trachea, and suggests tracheoesophageal fistula Vomiting of uncurdled milk, often with large amounts of mucus, indicates obstruction of the esophagus Vomiting which becomes forcible indicates obstruction at the pylorus or high in the duodenum Blood, usually changed in color by the action of gastric juice, may be found in the vomitus of infants with high intestinal obstruction, and does not necessarily indicate ulcer Bile in the vomitus indicates obstruction below the entrance of the bile-duct into the duodenum, but it must be remembered that in congenital lesions of the intestine, the bile-ducts may enter the duodenum at abnormal sites The stool in cases of complete obstruction resembles meconium, lanugo hairs are absent In partial obstruction, the stool may be small and constipated In cases suspected of esophageal obstruction, valuable information in regard to the site of the obstruction may be obtained by gently introducing a catheter into the esophagus In cases of complete obstruction of the esophagus, air may sometimes be demonstrated in the stomach, this sign, suggested by Dr W J Merle Scott, indicates a communication between the stomach and the trachea The x-ray gives valuable information in regard to the site of intestinal obstruction The clinician should insist upon being present while fluoroscopic examination is being made Observations should be made before the introduction of radiopaque material, otherwise, a foreign body may be overlooked, as in one case not in this series As a rule, x-ray examination is not required in cases of pyloric stenosis, but in cases of duodenal obstruction, it may show delayed emptying time of the stomach, enlargement of the first portion of the duodenum, narrowing below the site of a partial obstruction, and in certain cases, internal hernias Radiopaque material used as an enema may aid in the diagnosis of partial obstructions of the lower intestine

Prognosis The immediate prognosis in cases of severe vomiting depends upon (1) the state of nutrition of the patient and (2) the possibility of removing the cause of vomiting As a rule, the acute metabolic disturbances—such as dehydration, hypochloremia, alkalosis—yield readily to appropriate treatment but malnutrition of marked degree due to prolonged starvation can only be relieved after the vomiting has been stopped The outlook in tracheoesophageal fistula, and in multiple atresias of the bowel, is absolutely bad Obstructions at the pylorus due to spasm yield to medical treatment, undoubtedly, many cases of hypertrophic pyloric stenosis can be cured eventually by medical treatment alone It is our experience, however, that the mortality is lower, and that the cure is immediate by

operation in the hands of a skilled surgeon Stenosis of the esophagus requires dilatation which may have to be repeated often Uncomplicated cardiospasm in early infancy may sometimes be cured by means of feeding by stomach tube Duodenal obstruction, complete and partial, may be cured by operation We have been impressed by the fact that the patient with congenital obstructions of the gastrointestinal tract withstands operation well, even when the nutritional condition is poor, provided that the patient is suitably prepared for operation, and that no infection is present The remote prognosis depends in part upon the presence or absence of other anomalies, such as mongolism, mental retardation, and nervous instability Repeated vomiting in later childhood may follow that in infancy, we have not observed our patients long enough to know how frequently this may occur in the various types of congenital obstruction A partial answer can be given by examining the histories of twenty older children with recurrent vomiting These cases fall into two groups

1 Nine, in whom the attacks were accompanied by severe ketosis, and in whom no evidence could be found for intestinal obstructions Severe hypoglycemia was present in six. Migraine in one of the parents, and allergy or eye strain in the patient, were often present. The average age of onset was 4 3 years, the attacks usually ceased by the twelfth year, on the average, by the eighth year

2 Eleven children in whom the attacks were accompanied by moderate ketosis only, and in whom evidence was obtained of intermittent intestinal obstruction. (Table III)

The evidence was conclusive in four patients who were cured by operation, and was suggested by x-ray in seven The average age of onset was 2 1 years, but the onset occurred in only three during the first year of life No case formerly diagnosed as pylorospasm or pyloric stenosis was observed The evidence from the study of older children although not very extensive, suggests that severe vomiting in infancy may sometimes, but not often, be followed by recurrent vomiting in later childhood In all likelihood, cases of spasm of the cardia and pylorus, and possibly cases of milder duodenal obstruction recover spontaneously Children with severe obstruction in the first year are likely to succumb if they are not subjected to operation Obviously we cannot yet be certain that operation, even if apparently successful will assure a permanent cure in all forms of serious congenital obstruction

TABLE III—RECURRING VOMITING IN OLDER CHILDREN

Nine cases of Acetonemic Vomiting showed no evidence of anatomical obstruction.
Eleven cases showed evidence of anatomical obstruction

	Case	Sex	Site of Obstruction	Age—years Onset	Cure	Last Exam	Special treatment

Treatment of Severe Vomiting in Infants

From what has been said, it is obvious that surgical treatment is required in cases of severe organic obstruction But it is also obvious that medical treatment is essential in all cases We can outline here only a few of the more important medical measures The immediate problem is one of correcting the *results* of vomiting—dehydration, loss of chloride, and starvation Normal salt solution or Ringer's solution should be administered by subcutaneous injection in sufficient quantity to relieve dehydration, as shown by return of normal tissue turgor, and to replace

plasma chloride, as shown by the presence of chloride in the urine If the loss of chloride is very great, alkalosis with convulsions is likely to occur, in this case, magnesium sulfate or calcium gluconate should be injected into the muscle, and, in addition, normal salt solution should be injected beneath the skin Intravenous injection of glucose—ten per cent solution—is of immediate value in acute starvation Venoclysis is indicated in cases of acute anhydremia with symptoms of shock, and in children unable to retain any of the fluids given by mouth The transfusion of blood is of value in cases with severe malnutrition, anemia, or infection In cardiospasm, feeding by tube may not only meet the immediate requirement for food, but, in young infants, may relieve the cardiospasm In pyloric obstruction, not obviously due to hypertrophic stenosis, it is advisable to use atropine in full doses, feedings thickened with cereal, and sedatives, especially phenobarbital In our opinion, operation is the best method of treatment of pyloric stenosis Infants with severe vomiting due to obstruction below the pylorus must be treated by operation When operation is indicated, it should be carried out as soon as possible, delay results only in loss of weight and liability to infection In preparing the infant for operation, the loss of fluid and chloride must be restored After the operation, transfusion of small amounts of blood may be required The first fluid offered after operation should be water, diluted salt solution, or glucose If this is retained, small feedings of whey, human milk, or an appropriate milk formula may be used It is much safer to proceed slowly, for the infant at this time can withstand underfeeding better than it can withstand an intestinal upset, and the requirements for fluid can readily be met by infusions The full caloric requirement of the infant can usually not be offered before the seventh or tenth day We have found that whole milk and corn syrup mixtures are suitable The caloric requirements of greatly undernourished infants may be considerable Thick feeding has no advantage after operation

Summary

1 In a series of ninety cases of severe vomiting in infancy, congenital obstructions of the gastrointestinal tract were found in fifty-seven, or 63 5 per cent.

2 Forty-one of the patients with organic obstruction were relieved by operation, the relief was usually prompt in pyloric stenosis, but in duodenal obstruction, the relief was often delayed

3 Sixteen of the infants with organic obstruction died, five because operation could not correct the defect, four died immediately after operation, although the defect had been corrected, seven died a considerable time after operation, usually as a result of other congenital defects

4 The ultimate prognosis in the infants relieved of vomiting by operation is not known For this reason, a series of twenty cases of recurrent vomiting in older children was analyzed Congenital partial obstructions of the gastrointestinal tract was present in four, and probably present in seven None of these children had had pyloric obstruction in infancy In nine, no evidence for organic obstruction of the gastrointestinal tract was found

5 Adequate medical treatment of cases of severe vomiting in infancy is essential, particularly those requiring operation

6 In the treatment of congenital obstructions of the alimentary tract in infants, close cooperation between the pediatrician and the surgeon is essential

STRONG MEMORIAL HOSPITAL.

TRUTH WILL OUT

A clinic was once suing on a long overdue account and the *business head of the* clinic was giving the evidence "But I assure you," said the defending lawyer, "that many of these fees were made for visits that were entirely unnecessary, and that your partner continued these visits long after the patient was out of danger" "Indeed, no," indignantly replied the doctor, "I am quite certain that the patient was in very grave danger so long as my partner continued his visits"—*Medical Record*

"It is said that General Hugh Johnson has been employed as a radio commentator by the Bromo Quinine outfit to enlarge the demand by increasing headaches"—*Roentgen Economist*

TRAUMATIC SUBDURAL HEMATOMA

SIDNEY W GROSS, M D and THOMAS J O'KANE, M D, *New York City*
From the Department of Surgery, Morrisania City Hospital, Dr G E Milan, Director

In recent years several excellent contributions have been made to the study of subdural hematoma Many of these reports, however, have been published in neurological journals so that the subject has not had as much dissemination among general practitioners as its importance warrants

A subdural hematoma is a collection of clot, or the fluid resulting from the disintegration of a clot in the subdural space—a potential space between the arachnoid and inner surface of the dura This collection of clot or fluid is surrounded by an outer connective tissue membrane which is adherent to the dura, and an inner thin membrane of proliferated arachnoidal cells

Subdural hematomas are formed, when, following an injury to the skull, usually of a mild nature, a vessel entering the longitudinal sinus is torn These vessels are peculiarly susceptible to injury since they enter the longitudinal sinus at the right angles and are relatively unsupported by surrounding structures The pressure in the venous sinuses and the veins entering the sinuses is low, so bleeding occurs slowly and the appearance of symptoms after the initial trauma (which is often forgotten) is delayed for several days or weeks As the clot forms there is a proliferation of fibroblasts on the surface of the clot next to the dura, forming an outer membrane, while the inner membrane is formed from the arachnoid Thus the clot becomes encysted If the original encysted clot is small, the appearance of symptoms is delayed until this mass increases in size as fluid is drawn into the hemorrhagic cyst by osmosis Gardner[1] believes that as the molecules of hemoglobin forming the clot are broken down into simpler organic compounds, the osmotic tension is altered to favor the passage of fluid into the hematoma, forming a cyst-like structure containing a yellowish or greenish-yellow clear fluid Hematomas may produce symptoms within a few days after the injury In these cases a well-defined tents of the hematoma in the early cases is of the consistence and appearance of currant jelly

In the past eighteen months the authors have observed five cases of subdural hematoma which were operated upon at the Morrisania City Hospital During this period about seven hundred cases of head injury of sufficient severity to warrant hospitalization were seen

Case Reports

CASE 1 A S, colored, married, forty-eight years old, was admitted to the hospital on February 5, 1935 She was stuporous, confused, and a history could not be obtained. She was in extremely poor physical condition She answered questions when aroused but it was impossible to find out anything definite concerning her illness A subconjunctival hemorrhage was present in the right eye. Both eyes deviated spontaneously to the right. She had a right hemiparesis with a positive Babinski on the same side The left pupil was larger than the right and both reacted poorly to light The fundi showed blurring of the nasal disc margins The pulse was sixty and the membrane has already formed The conblood pressure 160/100 The next morning it was impossible to awaken the patient and her hemiparesis had become more marked A lumbar puncture yielded a clear fluid under slightly increased pressure containing ten lymphocytes and a slight increase in globulin The patient was taken to the operating room, and because of the right hemiparesis a trephine opening was made in the skull in the left temporal region The dura bulged but was not discolored When the dura was opened the brain was tense and did not pulsate, but was otherwise normal The patient was immediately turned over, the right side of the skull prepared and an opening made in the right temporal region The dura on this side was also tense and bluish When the dura was opened a large subdural hematoma was disclosed It was cystic and contained a large amount of yellowish fluid The patient regained consciousness on the table and it was necessary to give her ether to quiet her The

clot was removed On her return to the ward the patient improved rapidly and she was discharged three weeks after admission She has been back at work for some time and is entirely symptom-free

Comment No history was available at the time of the patient's admission An exploration was considered advisable because of the slow pulse and the progressing hemiplegia with a dilated pupil on the side opposite to the hemiplegia It is interesting that the hematoma was found on the side opposite the large pupil, and ipsolateral with the hemiplegia The usual localizing signs were, therefore, entirely misleading This case demonstrates the importance of exploring both sides when a hematoma is suspected and not found on the side first explored. When the patient recovered she told of having received several blows on the head during the five weeks preceeding her operation A blood Wassermann taken postoperatively was four-plus, though the spinal fluid serology was negative

CASE 2 M S, single, white, waiter, twenty-five years old was admitted on December 20, 1934, because of occipital headaches, vomiting, and failing vision On November 17, 1934, he was struck on the jaw during an altercation He was "knocked out" for a few minutes but he soon recovered completely and continued at work He remained well and worked to November 29, when a severe occipital headache suddenly appeared In a few days the headache was accompanied by vomiting These head pains increased in intensity and finally became almost intolerable He was admitted to another hospital where a diagnosis of "meningo-encephalitis" was made

On his admission to the Morrisania City Hospital no evidence of injury to his head was noted An x-ray of his skull was negative, the fundi showed bilateral severely choked discs with hemorrhages and exudate The visual fields showed no defects The neurological examination was normal except for a slight right central facial weakness The spinal fluid was clear and colorless with a pressure of 500 mm of water The patient was considered a brain tumor suspect and a ventriculogram was done to aid in localization of the lesion The ventriculogram showed a shift of the entire ventricular system towards the right The left lateral ventricle was depressed from above

A left parietal cranotomy was done When the dura was opened a large purplish mass was seen When this mass was incised a large amount of chocolate-colored fluid and degenerated clot was found The outer membrane of the hematoma was about 3/16" thick. The inner membrane was yellow in color and very thin A complete removal was done. Following the operation the patient made a rapid recovery and has since returned to work entirely symptom-free

Comment This patient presented several unusual features As often happens, the patient did not tell us of his injury until after the operation The high-grade choked discs without localizing signs led all observers to the diagnosis of a cerebral neoplasm The ventriculogram localized the lesion accurately, but its nature was not apparent until the dura was opened A complete removal of the hematoma was possible since a large flap had been made. Had a diagnosis of hematoma been suspected, clinically, it could have been satisfactorily treated through a much smaller opening in the skull

CASE 3 M B, white, male of forty-five, was admitted in coma on March 12, 1936 About twelve days previously he had been kicked in the head during a fight. For a few days he had a swelling in the left parietal region Following this injury the patient's behavior altered. He remained at home, and often spoke incoherently He gradually became increasingly drowsy, and soon began to complain of right frontal headaches On March 11, the patient's wife was unable to arouse him The patient was a chronic alcoholic. In 1930 he had a fractured skull, followed by headaches, insomnia, poor memory, and occasional convulsive seizures

On admission to the hospital the patient was deeply comatose with a pulse of fifty The optic discs were normal, there was a left facial, central in type Both upper extremities were spastic, the right more than the left The plantar responses were extensor, bilaterally Lumbar puncture yielded a clear colorless fluid under pressure of 180 mm of water

A diagnosis of subdural hematoma was made and an immediate operation was advised The consent for operation was withheld for twenty-four hours, during which time the patient became less stuporous for only short intervals following especially the administration of hypertonic glucose He had convulsive movements in the right upper extremity with turning of the head and eyes to the right The right pupil was larger than the left. Both reacted to light

On March 14 consent for operation was granted An opening was made in the skull in the left temporal region The procedure employed was similar to that used in subtemporal decompressions except that the

opening in the skull was somewhat higher A large subdural hematoma was disclosed It had a tough outer membrane which was adherent to the dura The hematoma was extensive and two to three cms thick. The hematoma was removed by irrigation and suction Following the operation the patient remained comatose and had frequent right-sided seizures The patient's condition remained poor, and fearing a hematoma on the opposite side had been overlooked, or that a new collection of blood had occurred on the left side, the patient was returned to the operating room the next day However, a hematoma was not found on the right side, nor had a new clot formed on the left The brain was markedly edematous however, and did not pulsate The patient expired on March 16, at 9 30 A M

Comment This patient had been comatose at home for a day before his admission to the hospital There was a further delay of twenty-four hours before consent for his operation was granted During this time the patient's pulse was always slow, ranging between forty-four and fifty most of the time. The extreme bradycardia was an important fact in arriving at a diagnosis of subdural hematoma rather than prolonged coma which sometimes follows a series of convulsive seizures The failure for the patient to recover in spite of the removal of the hematoma was no doubt due to the prolonged severe compression of the brain associated with irreversible damage to the medullary centers The power of the vital centers to recover diminishes rapidly with prolonged compression When a diagnosis of subdural hematoma is made, immediate operation is demanded

CASE 4 F D, male of forty-four, was admitted to the hospital on July 10, 1936 While at work as a roofer he suddenly became dizzy, had a severe headache, and collapsed Two weeks before admission, while intoxicated, he was struck on the head with unconsciousness for an unknown period of time The next morning he felt well and continued to work up to the time of admission to the hospital The patient recovered rapidly in the hospital and he was thought to have suffered a "heat stroke" He left the hospital at his own request on July 13

On July 16, headache, vomiting, and diarrhea suddenly appeared The next day he became drowsy and was readmitted to the hospital On examination the optic discs showed blurring of the margins, there was a left central facial weakness and the tendon reflexes in the left upper extremity were increased The pulse rate was forty and the blood pressure 140/80 The spinal fluid was clear and colorless with a pressure of 140 mm of water The patient became increasingly stuporous When roused he complained of severe headache

A diagnosis of subdural hematoma was made and an operation was done immediately under local anesthesia The usual right subtemporal decompression incision was employed, although the opening in the skull was made somewhat higher in position The dura was blue, and did not pulsate A dark brown membrane was present under the dura When this was opened considerable fluid and semi-fluid dark brown clot escaped The outer membrane of the hematoma and all the clot were removed The brain began to pulsate normally, and the patient became alert and free of headache almost as soon as the hematoma was opened The patient made a rapid, uneventful recovery and was discharged on August 8 with no complaints and no objective evidence of focal disease of the nervous system

Comment This patient was operated upon a few hours after a diagnosis of subdural hematoma was made Signs of severe compression of the brain had existed only twelve hours The early operative intervention undoubtedly accounts for the patient's speedy and complete recovery In this case the neurological signs were of localizing value, the hematoma occurring on the side opposite to the central facial weakness and the tendon hyperreflexia Bilateral exploration was planned, but since a marked improvement took place on the operating table as soon as the hematoma on the right side was evacuated, exploration of the left side was not considered necessary

CASE 5 C W, white, widow of 49, was admitted to the hospital on May 23, 1936 She fell and struck her head three days previously while intoxicated, and had been unconscious for a short undetermined period She seemed fairly well until three days later when she became confused and drowsy The stupor increased and on admission to the hospital it was extremely difficult to rouse her Her pulse was sixty-four and the blood pressure 162/110 She had a mild stiff neck. The pupils were equal but reacted sluggishly to light. The neurological status was otherwise normal A lumbar puncture yielded a xanthochromic fluid under a pressure of seventy mm of water On the second day of her admission she was irrational though less drowsy On May 27, the patient had a Jacksonian seizure involving the right side of the face the right upper and lower extremities When examined at 2 00 P M on this day she was stupor-

clot was removed On her return to the ward the patient improved rapidly and she was discharged three weeks after admission She has been back at work for some time and is entirely symptom-free

Comment No history was available at the time of the patient's admission An exploration was considered advisable because of the slow pulse and the progressing hemiplegia with a dilated pupil on the side opposite to the hemiplegia It is interesting that the hematoma was found on the side opposite the large pupil, and ipsolateral with the hemiplegia The usual localizing signs were, therefore, entirely misleading This case demonstrates the importance of exploring both sides when a hematoma is suspected and not found on the side first explored When the patient recovered she told of having received several blows on the head during the five weeks preceeding her operation A blood Wassermann taken postoperatively was four-plus, though the spinal fluid serology was negative

CASE 2 M S, single, white, waiter, twenty-five years old was admitted on December 20, 1934, because of occipital headaches, vomiting, and failing vision On November 17, 1934, he was struck on the jaw during an altercation He was "knocked out" for a few minutes but he soon recovered completely and continued at work He remained well and worked to November 29, when a severe occipital headache suddenly appeared In a few days the headache was accompanied by vomiting These head pains increased in intensity and finally became almost intolerable He was admitted to another hospital where a diagnosis of "meningo-encephalitis" was made

On his admission to the Morrisania City Hospital no evidence of injury to his head was noted An x-ray of his skull was negative, the fundi showed bilateral severely choked discs with hemorrhages and exudate The visual fields showed no defects The neurological examination was normal except for a slight right central facial weakness The spinal fluid was clear and colorless with a pressure of 500 mm of water The patient was considered a brain tumor suspect and a ventriculogram was done to aid in localization of the lesion The ventriculogram showed a shift of the entire ventricular system towards the right The left lateral ventricle was depressed from above

A left parietal cranotomy was done When the dura was opened a large purplish mass was seen When this mass was incised a large amount of chocolate-colored fluid and degenerated clot was found The outer membrane of the hematoma was about 3/16" thick The inner membrane was yellow in color and very thin A complete removal was done Following the operation the patient made a rapid recovery and has since returned to work entirely symptom-free

Comment This patient presented several unusual features As often happens, the patient did not tell us of his injury until after the operation The high-grade choked discs without localizing signs led all observers to the diagnosis of a cerebral neoplasm The ventriculogram localized the lesion accurately, but its nature was not apparent until the dura was opened. A complete removal of the hematoma was possible since a large flap had been made. Had a diagnosis of hematoma been suspected, clinically, it could have been satisfactorily treated through a much smaller opening in the skull

Comment This patient had been comatose at home for a day before his admission to the hospital There was a further delay of twenty-four hours before consent for his operation was granted During this time the patient's pulse was always slow, ranging between forty-four and fifty most of the time The extreme bradycardia was an important fact in arriving at a diagnosis of subdural hematoma rather than prolonged coma which sometimes follows a series of convulsive seizures The failure for the patient to recover in spite of the removal of the hematoma was no doubt due to the prolonged severe compression of the brain associated with irreversible damage to the medullary centers The power of the vital centers to recover diminishes rapidly with prolonged compression When a diagnosis of subdural hematoma is made, immediate operation is demanded.

CASE 4 F D, male of forty-four, was admitted to the hospital on July 10, 1936 While at work as a roofer he suddenly became dizzy, had a severe headache, and collapsed Two weeks before admission, while intoxicated, he was struck on the head with unconsciousness for an unknown period of time The next morning he felt well and continued to work up to the time of admission to the hospital The patient recovered rapidly in the hospital and he was thought to have suffered a "heat stroke" He left the hospital at his own request on July 13

On July 16, headache, vomiting, and diarrhea suddenly appeared The next day he became drowsy and was readmitted to the hospital On examination the optic discs showed blurring of the margins, there was a left central facial weakness and the tendon reflexes in the left upper extremity were increased. The pulse rate was forty and the blood pressure 140/80 The spinal fluid was clear and colorless with a pressure of 140 mm of water The patient became increasingly stuporous When roused he complained of severe headache

A diagnosis of subdural hematoma was made and an operation was done immediately under local anesthesia. The usual right subtemporal decompression incision was employed, although the opening in the skull was made somewhat higher in position The dura was blue, and did not pulsate A dark brown membrane was present under the dura When this was opened considerable fluid and semi-fluid dark brown clot escaped The outer membrane of the hematoma and all the clot were removed The brain began to pulsate normally, and the patient became alert and free of headache almost as soon as the hematoma was opened The patient made a rapid, uneventful recovery and was discharged on August 8 with no complaints and no objective evidence of focal disease of the nervous system

Comment This patient was operated upon a few hours after a diagnosis of subdural hematoma was made Signs of severe compression of the brain had existed only twelve hours The early operative intervention undoubtedly accounts for the patient's speedy and complete recovery In this case the neurological signs were of localizing value, the hematoma occurring on the side opposite to the central facial weakness and the tendon hyperreflexia Bilateral exploration was planned, but since a marked improvement took place on the operating table as soon as the hematoma on the right side was evacuated, exploration of the left side was not considered necessary

CASE 5 C W, white, widow of 49, was admitted to the hospital on May 23, 1936 She fell and struck her head three days previously while intoxicated, and had been unconscious for a short undetermined period She seemed fairly well until three days later when she became confused and drowsy The stupor increased and on admission to the hospital it was extremely difficult to rouse her Her pulse was sixty-four and the blood pressure 162/110 She had a mild stiff neck The pupils were equal but reacted sluggishly to light. The neurological status was otherwise normal A lumbar puncture yielded a xanthochromic fluid under a pressure of seventy mm of water On the second day of her admission she was irrational though less drowsy On May 27, the patient had a Jacksonian seizure involving the right side of the face the right upper and lower extremities When examined at 2 00 P M on this day she was stupor-

ous Moderate neck rigidity was present The pupils were equal The deep reflexes on the left side were increased with a positive Babinski on this side The patient improved slightly following the administration of hypertonic glucose However, by 5 00 A M the next morning she was deeply comatose

An exploration for a subdural hematoma was undertaken A linear fracture was disclosed in the right temporal region The dura appeared normal, the pia-arachnoid was edematous, but the brain otherwise was normal An opening was then made in the skull in the left temporal region The dura was tense, bluish, and did not pulsate The dura was opened and an extensive currant-jelly clot disclosed and removed

Following the operation the patient became somewhat more alert, but she developed rales in her chest, became cyanotic, and died twenty-four hours later

Comment This patient developed signs of cerebral compression three days after her injury Her physician at first attributed her stupor to alcoholism, but when she failed to rouse after several hours he suspected an intracranial injury The progressively increasing stupor with a slow pulse made diagnosis of subdural hematoma probable The right-sided convulsion pointed to the left hemisphere as the probable localization The increase in reflexes and Babinski on the left side along with x-ray evidence of a fracture on the right side led to an exploration on the right side When a hematoma was not found on the right, the left side was immediately explored and the suspected lesion discovered

Discussion

Several publications concerning this entity bear the title "Chronic Subdural Hematoma," following the lead of Trotter[2] who in 1914 reported four cases and discussed the relationship to pachymeningitis hemorrhagica interna A review of our case histories and those of other observers reveals that often only a few days may elapse from the injury to the development of symptoms, and yet at operation the findings which heretofore have been described in cases of "chronic" subdural hematoma are disclosed—a well-formed thick outer membrane and a thin arachnoidal inner membrane, with clot in various stages of disintegration intervening It is our belief that the rapidity with which symptoms appear depends primarily on the size of the initial hemorrhage, though there may be other, as yet unknown factors

Cases reported from neurosurgical clinics tend to have relatively long histories This may be explained by the fact that patients with intracranial lesions referred to neurosurgical clinics most often have choked discs and are brain tumor suspects Thus, the impression gained was that subdural hematomas were of necessity slow in evolution The experience in large city hospitals where many acute head injuries are admitted is at variance with that gained on a neurosurgical service In our series the average interval from the injury to the time of operation was about four weeks The shortest interval was eight days and the longest eleven weeks

The pulse rate was slow in four of five of our cases In one case it was as slow as forty We have found the pulse rate of great value in evaluating the indications for exploration in a case suspected of having a subdural hematoma A slow pulse with increasing stupor is almost an absolute indication for exploration Contrary to the observations of others,[3] the pupillary signs have not been of great value In two patients the clot was found on the side opposite the dilated pupil, whereas in the other three cases the pupils were equal

Pyramidal tract signs are notoriously misleading in patients with subdural hematomas In one patient with a marked right hemiparesis the hematoma covered the right hemisphere, whereas in only one case was the hematoma found contralateral to the side with tendon hyperreflexia

Convulsive movements were present in two cases and in both were on the side opposite to the hematoma Convulsions are relatively infrequent in the reported cases of subdural hematoma. The spinal fluid findings were not at all characteristic. In four cases the fluid was clear and colorless Only one had a xanthochromic fluid, and in only one was the pressure above 180 mm of water Only one patient had papilledema, two had blurring of the disc margins, and two had normal fundi

Four of the patients were very drowsy or comatose All these patients had very

slow pulse rates The diagnosis of subdural hematoma must be seriously considered in every patient with increasing stupor and bradycardia even in the absence of focal signs or pupillary disturbances

X-rays of the skull have usually been negative in cases of subdural hematoma Coleman[4] reported twenty-four cases, of which only two had x-ray evidence of fracture of the skull In our own series, only one case of five had a fracture of the skull

We believe an exploration should be done as soon as a subdural hematoma is suspected Delay may jeopardize the chances of recovery Patients who are operated upon after prolonged compression of the brain rarely recover Our two fatalities, we believe, may have been averted by earlier operation

Both sides of the head should be prepared An incision similar to that employed in a subtemporal decompression is made The dura is then inspected through a small opening in the skull In cases of subdural hematoma the dura is tense and has a bluish-green color If an abnormal dura is found the opening in the skull is enlarged to about the size of a half-dollar the dura is incised and the outer thick membrane of the hematoma is opened The contents of the hematoma may be fluid, or jelly-like, and can easily be removed by irrigation and suction A small rubber tube drain is placed to have its exit at the lower angle of the wound which is closed in layers with fine silk sutures If the hematoma is not found on the side first explored, or if a bilateral hematoma is suspected, the patient should immediately be turned over and the other side explored In favorable cases the patient most often regains consciousness on the operating table The drain is removed after twenty-four or forty-eight hours Since the brain has been compressed, and its volume is smaller than normal there is no point in restricting fluids, or using hypertonic solutions intravenously As a matter of fact, it has been our practice to give normal saline by vein either during or shortly after the operation

Summary

1 A subdural hematoma should be suspected in every patient who has suffered a head trauma, however trivial, who begins to complain of headache a few days to several weeks after the injury, and who has a slow pulse and disturbance in the state of consciousness

2 In patients admitted to the accident ward in coma where no history is obtainable, subdural hematoma should be included in the differential diagnosis, especially if the pulse is slow

3 When a diagnosis of a subdural hematoma is made, exploration should be done without delay according to the principles above outlined

DIABETES LECTURE COURSE

On January 20 at 4 P M, the New York Diabetes Association of the New York Tuberculosis and Health Association will open a series of six weekly lectures for physicians on "Modern Treatment of Diabetes Mellitus and Its Complications" These lectures have been endorsed by the New York Academy of Medicine and will be given in Room 20 of the Academy's building

There will be no registration or admission charge and all physicians and medical students are cordially invited to attend.

The program of the entire series is as follows

January 20—"Physiology of Carbohydrate Metabolism," William Chambers, Ph.D
January 27—"Dietetic Management of Diabetes," Herman O Mosenthal, M D
February 3—"Insulin and Protamine Insulin," James Ralph Scott, M.D
February 10—"The Treatment of Diabetic Ketosis," Dana W Atchley, M D
February 17—"Gangrene, Infection and the Management of the Surgical Diabetic," Beverly Chew Smith, M.D
February 24—"Cardiovascular Diseases and Diabetes," George Baehr, M D

BACILLUS ALCALIGENES INFECTIONS

L H GOLDBERG, M D, *Nyack*
From the Medical Division, Nyack Hospital

The bacillus fecalis Alcaligenes, ordinarily a saprophytic intestinal organism, had been isolated in the past as the causative agent in rare and peculiar manifestations of disease states Sloboziano and Nasta[1] describe a case of fetal peritonitis in bivitelline twins born at term Both succumbed to the disease—one three days and the other five days postpartum The mother had been well throughout the entire period of gestation The fluid obtained by paracentesis during the life of the twins yielded pure cultures of the Bacillus Alcaligenes Autopsy findings in the face of an absence of enteritis and pulmonary and pancreatic infarcts were sufficient for the investigators to conclude that the peritonitis was of a primary character

Stanisevskaya, Egger, and Nikolenko[2] report on thirty-six cases of B Alcaligenes infections during a typhoid epidemic in 1927 Insofar as in eighty per cent of the cases studied the B alcaligenes was isolated from the bloods of serologically proven typhoid and paratyphoid patients, and that in the remainder it was a parainfection in typhus, malaria, influenza, and questionable malaria the authors came to no definite conclusion They are of the opinion, however, that the B alcaligenes group may be responsible for some complications and may be agents which favor the development of infectious diseases

Morosoff,[3] apparently commenting further on this above group of cases, states that he is of the opinion that the B fecalis alcaligenes plays only a role of a secondary invader in typhoid infections Whether this is uniformly true for all cases cannot be stated

Anderson[4] describes two cases in which B alcaligenes recovered from the blood stream was the causative pathogen It is particularly noteworthy on two counts The first is that in both cases the clinical course was that of acute rheumatic polyarthritis The second is that under the assumption that the organism entered the blood stream through the intestinal tract, both cases recovered on the administration of tablespoon doses of one per cent mercurochrome

Krais, in a thesis presented to the University of Muenchen in 1913 discussed the Bacillus Fecalis Alcaligenes as an inciting organism of disease He reported a case of a nineteen year old nurse who suffered from lancinating pains during defecation, two to three mucous mixed formed stools daily, before admission to the hospital Her condition in the hospital followed a febrile course of an acute gastroenteritis with herpes labialis, tenderness generalized over entire abdomen and temperature ranging to 102-104°F rectally After about three weeks during which time she improved and the temperature dropped to normal by lysis, cultures from the blood on bouillon gave a growth which was proven to consist of members of the B alcaligenes group

Mason[5] describes a case of acute meningitis in which the invading organism was B fecalis alcaligenes The patient was a twenty year old girl with a meningocele six cm in diameter in the lumbosacral region Two days after admission to the hospital she began a course of illness characterized by definite signs of meningitis The leukocyte count varied from 8,000 to 14,000 with a predominance of neutrophiles She made an uneventful recovery and is well twenty months after her discharge from the hospital

The organism isolated in pure culture from the cerebrospinal fluid, proved to be of B fecalis alcaligenes group It could not be found either in the blood, stools, or urine of the patient

W Moir Brown[6] and Stewart review two cases by Gracey[7] from Malaya of proven hematologic infections, and both of which recovered They also review Anderson's cases and others reported in this paper Their conclusions seem to warrant the assumption that, although the morbidity in B alcaligenes infections is severe, the mortality rate is apparently low

Bacteriologically the organism had been known since 1889 when it was iso-

lated from spoiled beer by Petruschky In 1904 Altschuller reported a case of typhoid fever from the blood of which typhoid bacilli were recovered, and from the spleen of which the B fecalis alcaligenes was recovered At that time it was felt by workers that there existed some sort of mutation of the typhoid bacillus within the body to that of the B fecalis alcaligenes This had never been proven A later laboratory report comes from the New York State Department of Health Hazen and Mortholaro[8] present an "hitherto undescribed microorganism of the alcaligenes group" It was recovered from a blood specimen of a suspected clinically typhoid fever

The woman, age forty-one, suffered from chills, profuse sweats, extreme prostration, and abdominal distention. The temperature range was 99 to 104°F , leukocyte count, 13,500 with ninety-one per cent neutrophiles Undulant fever, Tularemia, B Abortus, and the Typhosus group were ruled out by the laboratory She died on the forty-sixth day of her illness

This particular organism differed from the B alcaligenes group generally in being nonmotile, in not possessing flagella, and in producing only a slight alkalinization of milk Yet it fulfilled the general requirements to be classified with the B alcaligenes group It was a gram-negative organism, it did not ferment carbohydrates, and it did not form acetyl-methyl-carbinol

The strain isolated from the case reported in this paper belonged to the general group of the B fecalis alcaligenes, and showed no such differences as in the above cultures, yet it appears that the two cases seemed to have run a similar course while the disease state lasted *

Comment

When the Bacillus Fecalis Alcaligenes does assume the role of that of pathogenic micro-organism to man, man's reaction to that particular organism is as varied as man is himself In one group the signs and symptoms are like those found in the variety of typhoid bacilli infections, in another it seems to have simulated acute rheumatic polyarthritis, in another primary peritonitis was the dominant syndrome, while in another it provoked a reaction like that of an acute gastroduodeno enteritis Having entered the spinal fluid, this organism caused the typical acute meningitis as reported by Mason

In attempting to arrive at a clinical picture which would tend to bring it out as a disease entity one is hard put The diagnosis will invariably have to be made on the laboratory's investigation of the blood culture There is one distinguishing characteristic that may be emphasized It is a different picture In the rheumatic expression it is quite some shades different from the large run of rheumatic fever one sees clinically In the typhoid expression it is likewise markedly different in shades from the general run of typhoid infections No matter what forms or expressions it simulates, it is different That difference encountered clinically should be the incentive to a careful hematological investigation In one of Anderson's cases blood cultures were positive only with the rise in temperature On the days when the temperature was normal the blood cultures were sterile

There is a strong probability that there is a serological variation of various strains of B fecalis alcaligenes Some authors feel that immune serum can agglutinate only its homologous strain However, the clinical cases so far reported tend to show that some strains are markedly pathogenic and fatal, while others are less so Surely the majority of the strains of that organism are definitely nonpathogenic.

The B fecalis alcaligenes infection is an accidental one at most The question is far from settled and until further cases are reported—cases which would appear more satisfactorily worked up than the ones in the literature at present—we will still be dealing with a vague, unclear clinical entity Speculations as to its portal of entry should be held in abeyance until the primary stage in the mechanism of such an infection is definitely established in the bacteriological laboratory Nevertheless, in the case reported by Mason and in the history of the case reported in this paper,

*This comparison is made upon the description of the clinical findings as reported by Hazen and Mortholaro [8]

BACILLUS ALCALIGENES INFECTIONS

L H Goldberg, M D, *Nyack*
From the Medical Division, Nyack Hospital

The bacillus fecalis Alcaligenes, ordinarily a saprophytic intestinal organism, had been isolated in the past as the causative agent in rare and peculiar manifestations of disease states Sloboziano and Nasta[1] describe a case of fetal peritonitis in bivitelline twins born at term Both succumbed to the disease—one three days and the other five days postpartum The mother had been well throughout the entire period of gestation The fluid obtained by paracentesis during the life of the twins yielded pure cultures of the Bacillus Alcaligenes Autopsy findings in the face of an absence of enteritis and pulmonary and pancreatic infarcts were sufficient for the investigators to conclude that the peritonitis was of a primary character

The organism isolated in pure culture from the cerebrospinal fluid, proved to be of B fecalis alcaligenes group It could not be found either in the blood, stools, or urine of the patient

W Moir Brown[6] and Stewart review two cases by Gracey[7] from Malaya of proven hematologic infections, and both of which recovered They also review Anderson's cases and others reported in this paper Their conclusions seem to warrant the assumption that, although the morbidity in B alcaligenes infections is severe, the mortality rate is apparently low

Bacteriologically the organism had been known since 1889 when it was iso-

it would appear that the organism entered the blood stream and the spinal fluid through a direct contact with the rectal and anal discharges

Case Report

A F, an Italian aged thirty-eight, called the writer to his home on July 19, 1934 He complained of headaches, nausea and vomiting, chills and fever, and pain about the lower lumbar region

He stated that about a month earlier he felt a pain at the coccygeal area whenever he sat on a chair This discomfort lasted but two days and until his day of illness he felt comparatively well On July 18 he returned to his room about 2 00 A M , he awoke on the morning of the nineteenth with chills and fever, nausea, and vomiting

His examination at that time revealed scattered rales over the entire right lower lobe At no time during the course of his illness was there any cough or any productive mucus No points of tenderness were elicited anywhere, his temperature was 102°F by mouth and his pulse, 100 No other pathology could be discovered He was admitted to the hospital the following day The course of his illness during his stay in the hospital is best illustrated by the accompanying temperature, pulse, and respiratory curves (Chart I) From the very beginning he refused his food, the nausea persisted and he vomited frequently Within forty-eight hours the nausea and vomiting ceased, but the temperature began to rise to precarious heights, followed by profuse sweats Ordinary antipyretics were without any effect upon the temperature. The water balance was maintained by intravenous glucose and saline drips and fluids by mouth Except for the chill, temperature, and sweat sequence, he remained fairly comfortable After three days he became very irritable and began to complain of migratory evanescent pains in the back of his neck, and over his sternum, and refused all fluids given to him He grew more and more apprehensive and uncooperative On July 25, the physical signs revealed a pulmonary infiltration in left base The x-ray showed this infiltration, but failed to reveal any pathology in the right lung Three days later, the x-ray reported negative findings in both lungs, although scattered rales could still be heard throughout the entire chest wall His chills lasted from five to thirty-five minutes He was constantly distended abdominally, and he became more and more moribund

On July 27, the metatarsophalangeal joint of his left big toe became red, tender, and swollen There was no culture made from this manifestly septic embolic phenomenon It improved somewhat, did not go on to suppuration and it was not disturbed

On July 30, he was given 200 c c of whole blood by a direct transfusion This had little or no effect upon him That night he began to show evidences of cerebrospinal irritation by twitchings of the arms and face His breathing became shallow and labored. He became irrational and sank into a semiconscious state on the morning of August first, and died that noon of cardiac collapse

One noticeable feature of the case was the marked alteration in the skin pigment As the disease progressed it turned from the usual swarthy color typical of the inhabitants about the Mediterranean basin, to a darker brown At his terminus his skin color resembled the faded brown of a shriveled autumn leaf

Laboratory Data

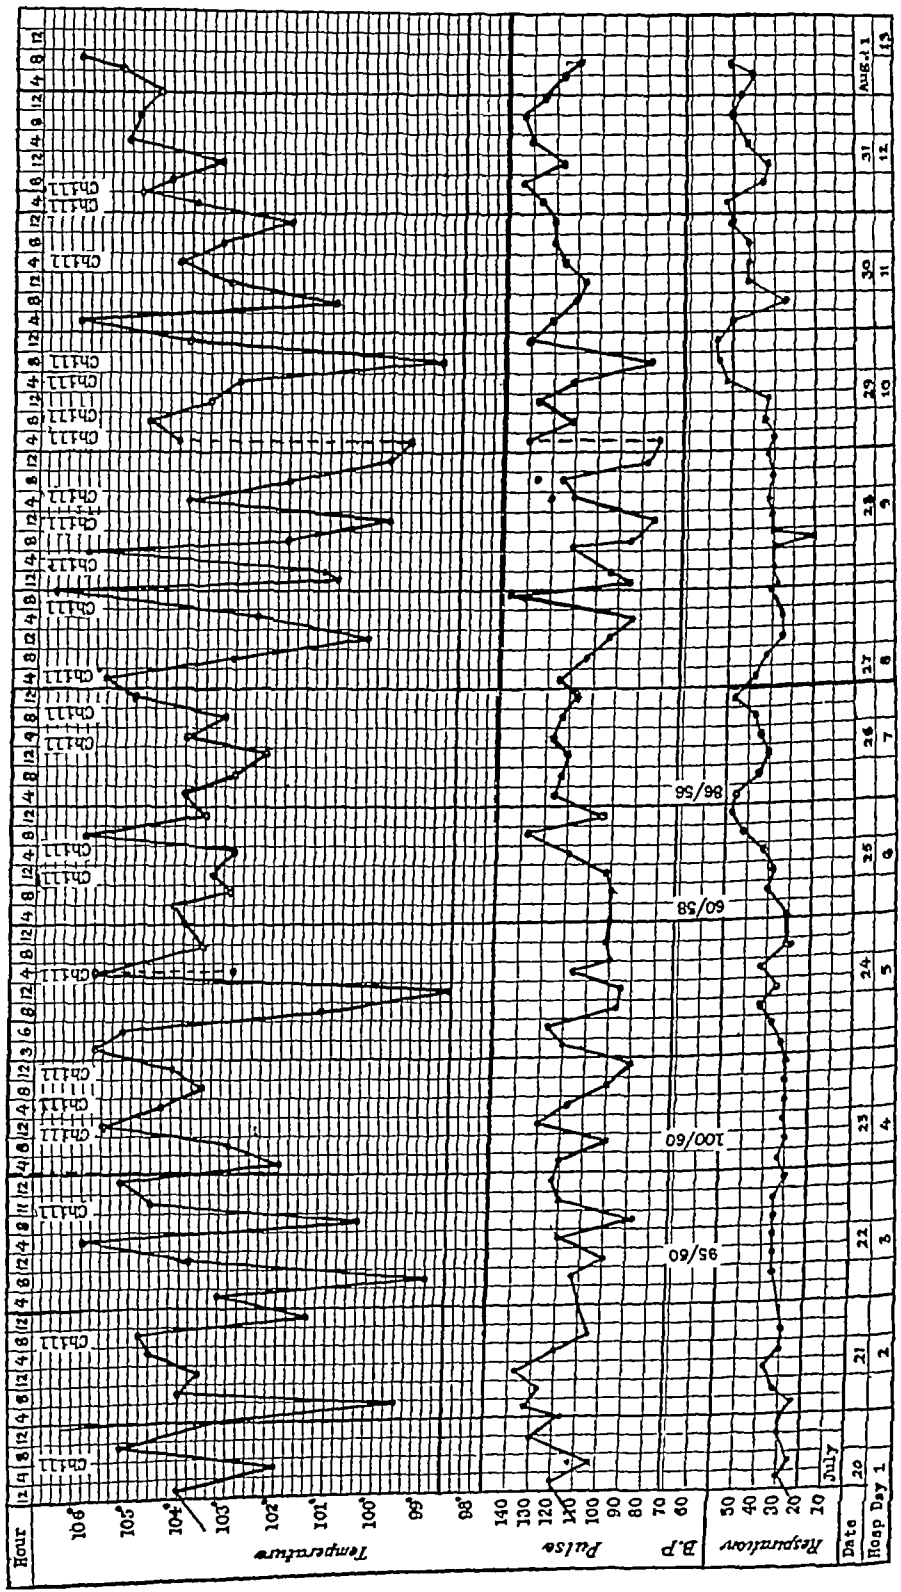
Stool Consistently negative for typhoid, paratyphoid, and B Dysenteriae

Agglutination tests Consistently negative for B Typhosus and B Abortus

Blood culture—I (July 20) Negative for ninety-six hours

Blood culture—II (July 22) Eighteen hours negative Forty-eight hours—many gram negative Bacilli Transferred to Russell's medium and Litmus Milk.

(July 26) Litmus milk alkali, Russell's Medium, no gas but slightly acid, Slant Alkali



Blood Culture—III (July 28) Twenty-four hours—many gram negative Bacilli Transferred to Russell's Medium

At this stage our laboratory organization became handicapped to a degree that we could not continue our investigation under our own roof We transferred our cultured material to the State Laboratories in New York City for further study Accordingly they reported to us on September 17, that the cultures submitted for identification resembled members of the B Alcaligenes group Further study of the organism proved them to be the typical B alcaligenes

Further laboratory data of significance are as follows

July 21 Urine—Faint trace albumin Indican, four plus Two to three granular

Preventive Medicine

By-Products of Periodic Health Examinations

CHARLES H GOODRICH, M D, *Brooklyn*

Presidential Address

There is no large group in the State who in the former decade worked more diligently for the development and popularizing of Periodic Health Examinations than our own. There is no group with greater interest and knowledge in this department. To consider its desirability today would be superfluous were it not for the fact that some new thoughts and idealisms might recreate former enthusiasm and lead in re-establishing leadership in this most essential department of Preventive Medicine

The main object of these annual or semi-annual audits is, of course, the preservation of Health This is accomplished by recording the normal and abnormal conditions found and giving instructions so that the abnormal may be eliminated before physical or mental handicaps ensue. Health has long been the subject of consideration and expression by wise men and women Today the people at large are more health conscious than ever before. Many philosophers and other nonmedical scholars have offered opinions regarding Health and a few of these may interest us as inspirational dicta, even though incomplete or inaccurate scientifically For all suggest that in this latter day, Periodic Health Examinations may develop a variety of values

An old Arabian proverb states "He who has health has hope, and he who has hope has everything"

Another suggests "For life is not to live—but to be well" (Martial)

Ameil says "In Health there is liberty! Health is the first of all the liberties"

We find that lay writers often emphasize the wisdom of corporeal care and development especially of muscular effort as Lytton remarks "Half our diseases come from neglect of the body in overwork of the brain" Wendell Phillips, the orator, thunders "Health lies in labor and there is no royal road to it but through toil" Once more it is said "From labor health—from health contentment springs" (Beattie) Sir William Temple concludes "The only way for a rich man to be healthy is by exercise and abstinence—to live as if he were poor" Dr Johnson offers "Health is so necessary to all the duties as well as the pleasures of life that the crime of squandering it is equal to the folly"

Carlyle stung us a bit when he wrote "The healthy know not of their health—but only the sick This is the physicians' aphorism and applicable in a far wider sense than he gives it." Perhaps he was suggesting Periodic Health Examinations! It remained for Voltaire to become even more suggestive in the remark that "The fate of a nation has often depended on the good or bad digestion of a Prime Minister"

Aside from their peculiar and impressive benefits to the individual examinees there are certain by-products which recommend these inventories to the mind of the earnest scientific physician

For instance, if we consider the growths of the breast, both male and female, we can acquire opportunity to study a large field Some years ago in one of our best Metropolitan hospitals a rule was established that whenever a woman was examined, whatever the reason or complaint, the breasts should be investigated. In the first seventeen hundred cases so examined twenty-one tumors were found—which had not been discovered by the patients All were removed Seven were found to be malignant—all apparently encapsulated, therefore early The balance were benign of varying types Seven lives were saved in the first group In the benign group those with adenomatous elements who might have escaped detection until malignant changes occurred, were also probably rescued from a measure of danger If we practiced Periodic Health Examinations consistently among all of our patients regardless of sex, pathologic studies of early breast tumors could be made on so large a scale as to give us hitherto unknown knowledge of incidence, of pathologic se-

Read at the Annual Meeting of the Second District Branch, Garden City, November 17, 1937

casts per field Occasional W B C *Blood Count*—W B C 27,400 Polys eighty-five per cent, Lymphocytes, Eleven per cent, Mononuclears, four per cent

July 23 Urine—Albumin and granular casts Many R B C W B C—9,000 white

It may be noted that all of our efforts were directed toward recovering and classifying the offending micro-organism We were clinically confident that the case presented unusual features of a definite bacteremia, and we could not overlook the similarity to an infection caused by a member of the colon group

Summary

A review of the literature appertaining to the clinical forms of B Alcaligenes infections is presented

A case is described and presented illustrating the unusual manifestations of a fatal B Alcaligenes Blood Stream infection

WHILE DINNER WAITS

"My woman wanted I should come
And get this bottle filled
If she has a spell and don't have some
In the house she thinks she's killed

"All right, Doc, just set it down
On the book an' then some day
When I'm a comin' overtown
I'll see't you get your pay"

* * *

"Dinner ready?" Yes, My Own,
I hear you calling me
Hang it! There goes the telephone!
Who is it? I might 's well see

Hello! Hello! Yes, Mrs Drake,
How are all the little ills?
Oh, I see Well, did you take
Six of the purple pills?

You took 'em and they made you worse?
Well, take six more Don't worry
If you don't improve we'll get a nurse.
Good bye I'm in a hurry

* * *

"Please-a, Mr Doc, — excusa me
You no hear-a de bell?
Please-a, Mr Doc, — you come-a see
My wife He sick like hell

"You gotta no dinner? Bye an' bye
You eat-a him, but please —
Before my wife he go and die —
You make-a him more ease"

—Paul B Brooks, M D

PATIENTS, NOT DISEASES, ARE TREATED

Sir Auckland Geddes, in an address delivered at the Bicentenary of the Royal Medical Society (reported in the *Edinburgh Medical Journal*, 44 366, 1937 and quoted in *Economics of Radiology*), said

Time and again, when, in various parts of the world, I have found myself ill or injured and confined to bed, I have been attended by doctors who never even found out that I had any medical training, in fact, they never found out anything about me at all They were concerned to treat "The Injury" or 'The Disease" and not me, the patient, they were, in short, dealing with a pure abstraction and thinking that they were being very scientific. The more I have seen of life and death, of pain and suffering, the more clearly I have realized that there is never in the real world outside the walls of the Medical School and teaching hospital "A Disease" to be treated, there is never "An Injury" to be dealt with, there is just a sick child, woman, man to be helped to get well In short, the real business of clinical medicine is not science It is, in the case of each sufferer, a personal relationship into which sincerity and medical knowledge are suffused by the physician, and trust and some dependence by the patient.

and cardiovascular disease and the definite responsibility of some focus for the combination

Recently in speaking of the prevention of various types of cardiovascular disease we concluded Considering the notorious incidence among physicians we might well begin by preventing these vicious killers in the medical students and hospital interns of today and in the young practitioners, by periodic examinations Let this be a part of their training—to make them prevention minded.

If we do this for each other and thus reduce the incidence among ourselves, publication of records may interest the people at large Thus through periodic health examinations and abiding by their indicated care we may prevent much of the now increasing cardiovascular disease.

An unusual opportunity to initiate the practice of Mental Hygiene occurs during a leisurely deliberate review of anatomical and physiological conditions at a periodic health examination While answering the questions propounded by the examiner the examinee will reveal much of the quality, color, attitude, and facility of mind which can form the basis of suggestion and influence greatly needed. Year by year the examiner can determine the disappearance of undesirable mental phases and the development of new and priceless powers, partly by elimination of physical handicaps, partly by suggestion so adroitly maneuvered as to avoid consciousness of management by the patient. This by-product alone is worth the price in time and effort. For the fate of the world may be dependent upon how and how much we develop the practice of mental hygiene. *We* must learn the role of emotions and conflicts in the production of *physical* symptoms and complaints The bulk of responsibility in prevention must be borne by parents, teachers, clergymen, physicians and hospital personnel (for sick bodies are usually crowned by sick minds), business executives, shop and other foremen, radio and cinema producers, authors, newspaper writers, publishers, and last but far from least all government officials, national, state and municipal who are elected to accomplish great good *for the people* If we except ten per cent of parents, many clergymen, twenty per cent of physicians, and a scattered hospital personnel, the bulk of these responsible people are not practicing mental hygiene but its antithesis Common attitudes toward mental illness are indifference, evasion, perplexity, or useless sometimes detrimental fussing

It is of almost emergency importance that the general practitioner interest himself in mental hygiene as an outstanding feature in Preventive Medicine His practical value to the community will be greatly enlarged if during health examinations he incidentally coaches the mind so that it can play the game of life with greater poise and elasticity

In many instances there is a wide gap in our knowledge of the facts, concerning some lesion, between the normal and the disease as we commonly first find it. This wide gap—of time or development of lesion—markedly lessens the continuity of our thoughts and abilities in considering a particular disease This interval, short or long, is an important temporal area In its confines, our knowledge and our ability to serve our patients may be so increased that the most valuable by-product of periodic health examinations would be this knowledge of the progressing pathologic processes and the steps between the normal and disease. The phases in which we discover tuberculosis is an outstanding example We find some early tuberculosis Now the question is, how early is it? If we get it much earlier by health examination there will be less mortality, less morbidity, less disability, and less likelihood of recrudescence. Moreover, we know more about *earlier* tuberculosis and its susceptibility to cure or arrest

Other wide gaps in our knowledge of the facts between the normal and diseases as we commonly first find them occur in various intra-abdominal lesions which give a history of long- or shortstanding constipation before they are brought up to a short turn by significant *pain* or a definite *emergency* If the *constipation* reported or discovered at the periodic health examination were *studied,* many of the preceding grades of disease would become familiar Examples are new-growths of the colon, new growths of the small intestine, new growths of the ampulla of Vater, diverticulosis, reduction in caliber of intestine or colon by constricting adhesions, uterine and ovarian growths causing pressure and widespread metastases, chronic appendicitis, chronic cholecystitis, and a number of other conditions of which

quence, and of the line of demarcation between probable success and futility of operative removal of the various grades of carcinoma Moreover, the possibility of the discovery of some of the elements in etiology of breast tumors might reasonably be expected

Nutritional problems, if studied with the aid of annual or semiannual examinations of apparently healthy persons, could be more frequently and fruitfully solved. In persons "undernourished" the cause would often be determined and promptly corrected or eliminated as in tuberculosis, hyperthyroidism, the various anemias, achlohydria, and other gastric functional disorders as well as unsuspected ulcer, constipation with copremia, the dystrophies and many other ills

Again we might learn of comparative incidence, habits of eating, habits of life, and many other facts which might lead to efficient public education ultimately preventing a goodly fraction of such conditions

Obesity, so proudly paraded by a supposedly physically prosperous group, could be largely accurately classified and, besides correcting the causes and preventing sequelae, we could determine more definitely how many *obese persons* become *diabetics* We know about what percentage of diabetics are previously obese, but we do not know what proportion of fat people become diabetics Again how many roly-polys are already diabetics of slight or greater degree? In other words how many of them have merely a slight or moderate deficiency of function in their islands of Langerhans, and can be controlled and guided for many years on a mixed diet with moderated use of carbohydrates without other treatment, because we reduce the excess of wear and tear upon these islands?

Mild hypothyroidism is probably present for years in many instances without correction During these years there is a degree of diffidence, low ambition, physical and mental deficiency which lessens learning, accomplishment, and satisfaction in life It would be an important gain if we could establish how many such cases there were in a thousand of obese persons Such knowledge and an incidental benefit to humanity can only be determined by generalized Periodic Health Examinations

We all know members of the third outstanding group of corpulenti, those universal enthusiasts about everything Often these are cases of so-called essential hypertension (when we first observe them), which is so frequently a factor in cardiovascular disease. In essential hypertension there is discoverable no gross basic lesion. Yet if the hypertension exists long enough fibrotic tissue alterations invariably take place in heart, arteries, brain, liver, and kidneys. These cases are mostly busy, keen male workers, who do everything "hard" especially physical or mental work, exercising, eating, drinking, smoking, and other indulgences The ratio of female cases increases as women lead similarly tense lives In these cases Periodic Examinations would not only help us to direct them into paths where the going would be safer and more graceful, but our records would ultimately divulge the relative importance of avoiding each of the excesses, which they are including in their regime For individually they would vary in the degree of their enthusiasms for *certain* excesses although indulging in most or all of them.

While preventing a modicum of early disability or death from cardiovascular disease, we could learn to specify and define more accurately the paths which humanity should avoid, as a basis of authoritative public education

The discovery of focal infections at Periodic Health audits may afford us finer chances of determining the *value* of early elimination of infected teeth, tonsils, gallbladder, bronchiectases, infective skin lesions, and similar centers

In many instances the patient is oblivious of the infection and of its effect until examined—whereas the sequelae evident later shows grosser development and sometimes irreducible structural changes A considerable period of such observations would provide records plainly demonstrating the degree of responsibility assignable to focal infections in the production of several serious conditions notably arthritis and hypertension with or without generalized cardiovascular disease Some hold that the focal infection is an etiological factor *sine qua non*—others that it is a very uncommon cause of either More accurate knowledge is desirable and we believe obtainable through a multitude of anticipatory analyses of conditions observed long before the generalized diffusion of infection or its products Also in this stage might well be demonstrated the inter-relation of arthritis

home from school for lunch he starts a commotion, hollering at the top of his voice, calling his mother all kinds of vile names Nothing that she prepares for his meal suits him The mother is becoming a nervous wreck, dreading the moment when he is home He gets such tempers and spells several times daily Our boy is physically well-developed, about 5 feet 8 inches tall and weighs 135 lbs but, his mentality is not developed, he is a problem and hard to handle

"Hoping that you will advise us what to do I thank you, and remain "

This letter preceded the visit of both parents and their boy to the clinic. The short description was correct, but one-sided It gave no idea of how the *parents* behaved Their answer to the boy's misconduct was to punish him severely In fact a vicious circle had developed so that it was difficult to tell who was the cause of the boy's violence and whether this was not the effect of *their* misbehavior

Subnormal individuals are often gentle, submissive, and debonair But those who are not may become ugly and sometimes swell the ranks of the criminals Mostly there is nothing to be done or the solution is internment in an institution

In this case kindness and an entirely new approach was of great help Not that the patient's intelligence made any progress That was out of the question But he soon became easier to manage and to get along with.

Doctors, Beware!

Except in very pronounced cases it is quite difficult to diagnose *mental retardation* and it is altogether a mistake to prognosticate *in the very young*

A girl of fourteen months was sent by a colleague because she was much behind and because of symptoms of a "mongolian type" She was not able to sit up, to stand up or to say anything But I did not dare to prophesy Her smile seemed to be a contrast to the rest of her behavior It showed some understanding I thought I had caught some signs of intelligence.

One year later there was much improvement without any treatment, which the parents had refused Four years later she was not entirely normal, but *superior* to the average child of the same age

A child of five Mentally *retarded*

Learned to walk early, but first talked at three

Restless, irritable, speaks fast, jumps from one thought to another Acts like a younger child Although he is spoiled and overprotected and has no initiative, prognosis is good because he is partly cooperative and shows much interest in things around him and in what he is told, even though he understands but imperfectly

The parents are instructed how to behave, to avoid oversolicitude, to allow him much freedom to work and do and see things, to help him only when it is absolutely necessary—all principles to be followed in the upbringing of the normal child as well

Two years later much improvement

Four years later, although somewhat duller than other children of his age, he is regarded as normal in school and among his friends and is making progress

---

AMERICAN PUBLIC HEALTH ASSOCIATION

The officers of the American Public Health Association announce that the 67th Annual Meeting will be held in Kansas City, Mo, October 25-28

Dr Edwin Henry Schorer, Director of the Kansas City Health Department, has been appointed Chairman of the Local Committee

He will be assisted by a large group of city and state officials and community leaders

A long list of affiliated organizations meet habitually with the American Public Health Association They include The American Association of School Physicians, The Association of Women in Public Health The Conference of State Laboratory Directors, The Conference of State Sanitary Engineers, The American Association of State Registration Executives, Delta Omega, and The International Society of Medical Health Officers

The attendance at the 67th Annual Meeting will exceed 3,000 professional public health workers from every State in the Union, Canada, Cuba, and Mexico

---

Patient "The newspapers should inform patients what to do until the arrival of the doctor"

Doctor "They had better inform the doctors how to live until the arrival of a patient."—*Medical Record*

constipation may be a leading symptom for months or years before pain or emergency symptoms jar the judgment of the patient into consulting a physician

We might cite a single example where our helplessness and powerlessness were especially disheartening A young, unmarried woman of thirty-one years consulted us for enlargment of the abdomen which she noticed three or four months before It had now become embarrassing and there was a little pain Examination showed that she had some mass in the lower abdomen and generalized collection of fluid within the peritoneal cavity Exploratory operation was arranged immediately and bilateral carcinomata of ovaries were discovered with metastases over bladder, coils of intestine, colon, practically every observable area of the peritoneum This lady gave a history of constipation covering a period of several years Had her case been studied at periodic health examinations she might have been saved Relief would have been undertaken at an entirely different stage than that in which it is usually offered Hence one of the most important by-products of periodic health examinations would be knowledge of those *silent stages* of destructive or crippling diseases concerning which, at the present time, we know little or nothing

A universal by-product of periodic health examinations for the *patients* is the disposal of thought, suspense, anxiety and worry concerning health until the next examination (excepting, of course, accidents and acute infections) This freedom is desirable for us all and can be secured in no other way

The most important by-product of periodic health examinations in the personal experience of the *practitioner* will be increased powers of observation For he will be looking for conditions hard to find in a field where normalcy pervades the scene. If he is to discern the tiny beginning with no proportions to speak of and little if any variation in color or function, his eye must be extraordinarily keen, his mind alert, and his ability to draw accurate conclusions from little evidences masterly His powers of observation will thus happily grow He will be a greater and a more useful physician

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Compelled to Steal

A young employee in a Federal Government office opened an envelope which he had no right to touch and removed some money—a small sum He was caught in the act and he confessed

Why did he do it? He was not poor Beside his salary, which was sufficient, he received weekly allowances from his father

But a month before another boy, in the same office, had done the same thing and, although the offender was promptly arrested, our patient felt a strong urge to imitate him and he succumbed to it Only an abnormal individual could behave that way

His lawyer could not help him much and the punishment was one year and a day in a Federal penitentiary, which, being more or less of a school for criminals, might have graduated him into full-fledged crime

But the mother remembered that when this young man was a small child and I saw him for some acute illness, I mentioned the fact that the boy was mentally subnormal, which she had not noticed I re-examined him now and, when called to Court before sentence was pronounced I testified or certified as to the boy's mental state, just in time to help him gain a respite of one year and a day under probation

Government employes, by the way, should be mentally and physically thoroughly examined before being given a job, especially one to which some responsibility is attached

Mind and Behavior

"I am writing to you, dear Doctor, to ask you to kindly give us advice regarding our son who is past fourteen years of age He is unruly and uncontrollable He is mentally deficient and attending an ungraded class Each and every day when he comes

malingering and chronic invalidism that European nations have found to be an inevitable concomitant of obligatory prepayment

With excessive demands for service, either rates must go up or benefits must be reduced As a rule, the latter is considered more expedient Even in our brief experience with group hospitalization, there has already been "a noticeable increase in the number of limitations in service contracts" The majority of plans disclaim liability if overcrowding born of war, epidemics or other public disasters makes it impossible for them to furnish the promised service Here again is a parallel with compulsory sickness insurance In periods of widespread unemployment or disease, precisely when the need is greatest, medical service under the insurance systems is necessarily degraded or curtailed

This is not to say that group hospitalization shares all the defects of compulsory sickness insurance and is as lacking in virtues In normal times at least and when properly administered, the former provides an easy means of payment for satisfactory institutional facilities Compulsory sickness insurance has always furnished inferior care at high cost

Patent Law and Ethics

The altruistic basis of the Principles of Medical Ethics is nowhere more evident than in the rulings governing medical patents In accordance with its ancient history of sacrifice for the public good, the profession forbids the selfish exploitation of medical discoveries by its members "It is unprofessional to receive remuneration from patents for surgical instruments or medicines"

Physicians have always considered it their duty to make their finds, however valuable, freely available to all mankind As medical research has grown more complicated and remedies more complex, however, there has developed the danger that unscrupulous individuals and organizations might exploit new discoveries for their selfish gain without regard for the purposes and ideals of the discoverers

To prevent this, there has been a growing tendency among physicians to patent their discoveries and then turn over the patent to a university or research organization to ensure its use in the public interest In this way the quality of the product can be protected, its manufacture standardized, and the price kept down

Perhaps the most notable example of this is the administration of the insulin patent by the University of Toronto As Dr Morris Fishbein avers in a recent article in the *J.A.M.A.*, without this "it is doubtful that a high quality, standardized product at a minimum price would have been made available nearly so soon

Moreover, there is no question but that inferior products in vast numbers would also have been offered for general use" At it is, quality has been maintained with a steady drop in price

Unfortunately, this arrangement has not always worked out so well Some patent-holding universities and foundations have hampered continued research by secretiveness and excessive jealousy of their legal rights with respect to other bona fide investigators

The control of medical patents is undoubtedly desirable to prevent unscrupulous exploitation of new discoveries by commercial interests The present method of transferring patents to individual universities and research organizations cannot, however, be considered wholly satisfactory The rivalries and non-cooperation engendered thereby lend weight to Dr Fishbein's proposal for a central, disinterested body to assume responsibility for the administration of all medical patents

By-Products of Periodic Health Examinations

Our President, continuing his campaign for the enhancement of Preventive Medicine, delivered a noteworthy address at Garden City on November 17, 1937,

EDITORIALS

Instructive Analogies

Business people who like to think in terms of mass production and large scale merchandising find it difficult to believe that private practice is cheaper than most organized medical service systems Yet evidence to this effect is constantly coming to light

"Overhead," in private medical practice, consumes no more than a third of the physician's gross income In group practice the American Medical Association has found that operating costs eat up forty to forty-two per cent of the total intake Even in universities with medical colleges "the cost of health services per student is not appreciably less than the cost for similar services in the private purchase of medical and hospital care"

The reasons for this are apparent Administrative expenses, high fixed charges for rent and plant maintenance, and an increased demand for unnecessary services more than nullify any economies made possible by joint purchasing

The situation is no different under medical insurance systems—merely somewhat worse As the Bureau of Economics of the American Medical Association observes in its survey of group hospitalization, "Insurance never lowers cost, it simply distributes the costs among a group of persons The expenses for the administrative machinery to effect such a distribution are also distributed along with the basic costs"

This would be insignificant if there were a proportionate rise in the quality of service, but such has never been the case Quantitative attacks on a host of unimportant maladies do not lower mortality or lengthen life—and a quantitative increase in services rendered is all that compulsory sickness insurance has ever accomplished

Advocates of the system in this country like to believe that Americans would react differently to the promise of benefits, that they would be less prone to magnify petty ailments in order to get a return on their payments The experience with group hospitalization fails to bear out this hope On the whole there has been a greater amount of hospitalization for minor ailments than had been expected "It was reported for one large plan that the subscribers were stricken with the desire to spend the week-end in a hospital" Another had to raise the rate for teachers "because they were inclined to take 'rest cures' during the summer vacations" Human nature is pretty much the same the world over, and there is no doubt that under compulsory sickness insurance this country would experience the same rise in hypochondria,

sulfanilamide The dosage which may cause such an aberration in the blood picture varies in different individuals Idiosyncracy to the drug may also play a part Furthermore, its chemical structure (p-aminobenzene-sulfonamide) in itself indicates that it is potentially capable of acting as a marrow poison

The patient who is receiving sulfanilamide requires the closest kind of observation The appearance of clinical signs of toxicity may often be averted by spectroscopic estimations of the blood for the detection of sulfhemoglobinemia and repeated blood counts for the study of the cellular elements Should immature red cells be noted, or a leukopenia appear, the therapy should be discontinued, at least temporarily, until the evidences of marrow poisoning have disappeared Where prolonged administration of sulfanilamide is contemplated, blood studies should be started with the onset of the treatment

CURRENT COMMENT

"HEALTH CAMPAIGNS ARE MAKING headway in many countries It is almost a crime nowadays not to be physically fit and the personal health of the individual is engaging the attention of several governments It is recognized that good health generally implies happiness, as it is certain that ill health is a main source of unhappiness Therefore it is obviously to the best interests of those who are chiefly responsible for the direction of a country that its people are as healthy as possible. Dictators are able to insist to a large extent upon the population making use of the facilities provided for gaining and maintaining the sound mind in the healthy body Democracies in this respect are in a less fortunate position They cannot compel, only advise, and it too frequently happens that advice is neither appreciated nor taken The result is that many disabilities which, if dealt with in time, might be prevented from going further, are neglected and may become a serious handicap"—Ideas which, because of their timeliness, cannot be presented too often The above comes from an editorial in *Medical Record* of December 15, 1937

"IF WE HAD JUST ONE GENERATION of properly born, adequately educated, healthy children, developed in character, we would have Utopia itself—even if we don't succeed with planned economy"—A succinct statement made recently by former President Herbert Hoover

"STATISTICAL EVIDENCE THAT THE health physical characteristics and social and economic backgrounds of children as well as their mental abilities have significant effect upon their rate of progress in the city (New York City) schools was presented in a survey made by the Board of Education Children who lagged behind in their school progress were generally those having poor health, small stature and most physical defects and those whose families had the lowest socio-economic status in the community Just the opposite conditions were true of pupils who advanced more rapidly than normal, conclusions were based upon case studies and statistical records covering 785 children in thirteen elementary schools in varied areas of the city "—The preceding is from a report in the *New York Herald Tribune* of December 19, telling of a study made by Eugene A Nifenecker, director of the bureau of reference, research and statistics of the Board of Education

"His research into children's physiques blasted the common notion that bright students are generally thin, frail and sickly while dull pupils are usually robust and overdeveloped physically

"He found instead that retarded boys and girls were lighter, shorter and less healthy than children whose educational progress was normal or rapid. The former also showed more sight and hearing defects and nutritional deficiencies and were generally less well behaved in their classrooms"

"THE VERY ABUNDANCE CREATED by science threatens periodically to ruin us because our social and economic situations are not equal to distributing it where it is needed," claimed Dr Gove Hambidge of the United States Department of Agriculture before the American Association for the Advancement of Science, meeting in Indianapolis

"Necessitous individuals," he said, "live lives of misery, necessitous nations sometimes seem to be on the way to smashing civilization This cannot be a matter of indifference to scientists, nor can they absolve themselves from their share of responsibility They, too, are part of the social organism, and *the fact that a man is a scientist is no guarantee that he may not be narrow, prejudiced, ignorant and stub-*

when he spoke before the Second District Branch Society

In summation of periodic health experiences, he points its advantages not only in detecting early lesions, but also in the accumulation of records which conceivably enough might clear unsolved etiologic factors Likewise from exercising his talent of observation, the examining physician will increase the penetration and power of his observations Finally, Dr Goodrich comments on the inclusion in the periodic health survey of the mental state, when evaluation the physical

The address is published elsewhere in this issue (page 127), and while all of us think we know all about the periodic health examination, we venture the prediction that all who read this address will find stimulating and thought-provoking suggestions so presented, that from the realignment of old observations new deductions are possible

Choline and Prostigmin for Gastric Hyperacidity

The pharmacological studies of the action of prostigmin have demonstrated that the parasympathetic stimulation induced is in reality the result of an inhibition of the esterase which inactivates acetylcholine That physotigmine and acetylcholine are synergists has been known for some time as the result of physiological experiments on muscle and nerve tissue Myerson, Rinkel, and Dameshek[1] investigated the action of these drugs on the gastric secretions

Following the use of acetylcholine or its derivatives, there was an increase in the amount of mucin produced and in the volume of the gastric juice Hydrochloric acid and pepsinogen, on the other hand, were markedly inhibited thereby greatly decreasing the acidity of the secretion A tonic effect on the entire gastrointestinal tract was also evident These results were also obtained with the use of prostigmin but to a lesser degree than noted with the choline group When combined in small doses, however, a maximum alkalizing effect was obtained due to the synergistic action of the two

The action of atropin in connection with the combined use of acetylcholine and prostigmin is of interest Where atropin is administered after the combined therapy has been started, only the amount of gastric secretion is diminished but the chemical alterations induced by the synergists is not changed Where, however, atropin has already been given the induced alkalinity is diminished to a considerable extent

In translating these findings into clinical medicine, they offer a means for the treatment of hyperacidity with or without an associated ulcer The authors themselves favor the administration of these drugs by the method of iontophoresis since by this means an increased secretion of mucin and a moderate alkalinity can be maintained for a long time

1 Myerson, Rinkel and Dameshek *New Eng J*

Agranulocytosis From Sulfanilamide

The introduction of a new therapeutic measure always calls for extreme caution during the early period of its use and until such time as its effects and side effects are fully known and understood Particularly is this true of a chemical which possesses the mass sterilizing properties exhibited by sulfanilamide We have heretofore commented upon many of the untoward reactions which accompany the administration of sulfanilamide Recently still another toxic effect from the use of this drug has been reported[1]

In one instance a complete agranulocytosis was noted and in three others there was distinct evidence of abnormal activity of the bone-marrow associated with anemia Erythropoiesis and leukopoiesis may both be interfered with by

1 Jennings G H and Southwell Sander, G *Lancet* 2 898 1937

City, in his letter captioned, "Pneumonia Serum Treatment Warning" He has voiced a warning incontestably sound, but there are other warnings, I think, that should be heard if the bugle call to action is to come to the practitioner with all its notes correctly proportioned and sounding clear and true and full

One part of the call by itself might possibly be misconstrued For instance, might not Dr Maddox's letter be interpreted as throwing more doubt on the efficacy of serum than is justified?

To pin one's faith on serum to the exclusion of good nursing and feeding, to the exclusion of full attention to the individual's physical make-up—and indeed personality needs—to the exclusion of "sustaining measures," would be, as Dr Maddox says, deplorable. So, also, would be failure to use oxygen where anoxemia is a factor of great moment. On the other hand, it would be most unfortunate—and I believe equally so—if, in a Type I case proven insensitive to horse serum, a chance of cure were to be lost by withholding serum Should not a note be in the call, a new note in an old call, to "use serum when called for"? I think so, and to me it should be as strong and as long a note as that of Dr Maddox stimulating the sense of caution. Indeed, I consider it justifiable to suggest that this new note be of such tone-color as to arouse hope and enthusiasm for cures never before possible

Speaking as one who sits on the Advisory Committees on Pneumonia Control of both State and City Departments of Health as from the State and County Medical Societies, I can assure Dr Maddox that very great care has been taken to do several things that bear on the points he has made. The danger of producing in the public mind overconfidence in the value of serum has been deliberately avoided as much as possible by emphasizing to the press the points that it is not useful in all cases and that it is not a certain remedy Also there was issued to the profession of the State as a pronouncement of the program preceding full public information a State Department of Health Circular No 20, "The Clinical Aspects of Pneumococcus Pneumonia," which described all means of treatment with use of serum as but one of the procedures now accepted Following that came the "Hand-book on Nursing Care of Pneumonia" which emphasized the value of nursing and sustaining measures With these facts in mind I do not believe either the public or the profession will fall into the error—at least, not to any great extent—of regarding antipneumococcus serum as a panacea which can replace time-honored methods of management.

Treatment of pneumonia has always been full of dangers It has today, though new hopes exist, even more dangers The dangers of delay in diagnosis, of incorrect typing, of sensitivity of patient, of overshadowing of other care by serum therapy, of failure to regard the disease as an emergency, all these dangers have been added It is quite a challenge

In conclusion, I submit the notion that the newly composed bugle call, which I dared to use as a simile, might well convey all these dangers and at the same time accent the emergency feature, the hope and enthusiasm serum therapy has roused and at the same time, just as strong and long the fine old note of proper general management. Thus, I think, the physician can be best aided to exercise his finest judgment while stepping lively in his attack

A Help to the Mute—Additional

22 W 74 St.
New York City

To the Editor

Kindly add the following paragraph to my letter of November 23, 1937

"When necessary, and in order to avoid any ambiguity, the end of a word is marked by strong sniff"

MAURICE SCIAKY

December 28, 1937

(The original letter appeared in the December 15, 1937 issue of the JOURNAL, page 2114)

The following story was told by Professor Nobl of the Policlinic in Vienna. An old Viennese professor was about to give his daughter in marriage to a young dermatologist. When asked what dowry he was bestowing with his daughter, the old professor replied "My boy, I can give you no money but I will give you two *psoriasis* patients"—*Medical Record*

Patient "and about my heart"
Doctor "Don't worry, it will hold out as long as you live."—*Medical Record*

"I don't like the looks of your husband," said the doctor "Neither do I," the wife replied, "but he's good to his children"—*Colorado Medicine*

born in fields outside his own specialty" (Italics ours)—Fuller excerpts from Dr Hambidge's speech, including the above, can be found in *The New York Times* of December 29

"'LAST YEAR THE INSURANCE PRACTITIONERS prescribed 60 million bottles of medicine, the largest number on record It is immaterial to my present argument whether this ocean of medicine did more good than harm, or whether it was prescribed necessarily or unnecessarily, but it is obvious that those persons who received these bottles of medicine either were sick or thought they were Based upon the amount of medicine sold, 1936 was the most unhealthy year which has occurred in the history of mankind Based upon the more exact methods which we use in vital statistics it was the healthiest.'

"Dr Dunstan Brewer, Medical Officer of Health, Swindon, England, in his latest annual report claims that the amount of serious disease in the population has dropped enormously during the present century, roughly about 50 per cent, while from the reports of the insurance commissioners we find that sickness has steadily increased."—The foregoing item and quotation from Dr Brewer's report come from the Medical Economics Abstracts department in the *Journal of the American Medical Association* for January 1, 1938

Pneumonia Serum Treatment Warning

115 E 61 St.
New York City

To the Editor

In view of attempted control of pneumonia largely by serum treatment it seems appropriate to precede the attempt by a note of warning against overconfidence in this line or method of treatment.

Nothing to date has been found that has reduced the mortality rate of pneumonia I say this boldly and advisedly

If improved serums can accomplish what is desired in the treatment of this dread disease it will be a great boom to humanity It is fortunate that so much money has been provided to insure obtaining the correct serum for each individual case. That is indeed an important factor The danger lies in the tendency of overenthusiastic dependence and sole reliance on the serum *per se* That is to be deplored and must be guarded, empirical treatment avoided.

If there is any value or virtue in long service, observation, and experience, allow me to revert through the long years of practice as far back as 1892 when grip and pneumonia were rife throughout the land The mortality rate was high Coal tar derivatives were very much in evidence in the treatment of pneumonia Antipyrine and acetanilid were very generally used Being greatly perturbed over the use of these drugs because I doubted their efficacy but felt they were doing much harm, I wrote a paper on a compilation and tabulation of thirty-eight cases of lobar pneumonia I had recently treated, and read it before the West Virginia Medical Society This was afterward published in the *Medical News* (Philadelphia) Aside from antagonizing and discouraging the use of the coal tar derivatives, particular stress was laid on management of the patient Good nursing and feeding were of paramount importance to maintain cardiac integrity As Weir Mitchell aptly said in one of his poems, "It's the man that's sick."

I appeal especially to young men in hospitals and in private practice to heed the warning that sustaining measures in conjunction with correct serum are all important. Last year the mortality rate in New York City was astoundingly high Let us hope that can and will be averted this coming season

ALBERT S MADDOX, M D

Other Pneumonia Treatment Warnings

2 E 103 St
New York City

To the Editor

I count it a privilege to have the opportunity to respond to the note of caution sounded by Dr A S Maddox, veteran of forty-five years of practice in New York

the need of same, and after consultation with the local medical profession in the area affected"

6 That in the allocation of public funds existing private institutions should be utilized to the largest possible extent and receive support as long as their service is in accord with the above proposals

"a That so far as the allocation of funds is concerned for these institutions, they should not be on a pro rata population basis, but should be limited strictly by the needs of given institutions in specified localities, and the allocation should have the approval of the medical profession in the locality in which the institutions are located"

"b That in the section of existing institutions to which public funds may be allocated their rating and their needs shall be measured by the standards of the Council of Medical Education and Hospitals of the American Medical Association, and that no public funds should be made available to existing institutions against and contrary to the majority opinion of the medical profession in the locality in which they exist"

7 That the investigation and planning of the measures proposed and their ultimate direction should be assigned to experts

"a It is recommended that the various subdivisions of the American Medical Association, namely, its national state and county components furnish to the Government, upon request, lists of experts in their communities to carry out their principles and proposals"

"b We regard the word "expert" to mean a man especially qualified by experience in his specific field The nominations of these "experts" should be by units of organized medicine. The nominations and recommendations by organized medicine should be given preferential consideration by Government in making its selection"

8 That the adequate administration and supervision of the health functions of the Government, as implied in the above Proposals, necessitate in our opinion a functional consolidation of all federal health and medical activities, under a separate department.

* * *

We, who subscribe to the above principles, proposals and recommendations held the view that compulsory health insurance does not offer a satisfactory solution on the basis of these principles and proposals and repeat our objections to its enactment in this country

Your Committee recommends the adoption by the House of Delegates of the above and *further recommends* to the House of Delegates that it authorize the creation of a Committee to confer with government agencies and other organized medical groups so that differences in conception, definition of terms and applicability of principles and procedures may be ironed out in conference This committee shall function for matters concerning the State of New York

We further recommend that the House of Delegates of the American Medical Association be asked by our Delegates to create a similar committee to act nationally

Arthur W Booth, *Chairman*	Elmira
Edward E. Haley	Buffalo
Samuel J Kopetzky	New York
Thomas A McGoldrick	Brooklyn

Floyd S Winslow (ex-officio)	Rochester
Peter Irving (ex-officio)	New York

THE SPEAKER Referred to Reference Committee B

Report of Reference Committee B on report of Special Committee to consider provision of Medical Care

DR. MCGOLDRICK Your Reference Committee endorses the report of the special committee to consider the provision of medical care The principles and proposals therein laid down should afford a good working basis towards the accomplishments in mind. Your reference committee will especially emphasize the proposal that the first necessary step towards the realization of the principles given is to minimize the risk of illness by increasing preventative efforts through the extension of public health service, federal, state, and local

And that the extension of federal, state, and local preventive health measures is approved provided it meets the needs of a given situation in the opinion of the medical profession in the locality affected

And provided that it integrates to the greatest possible extent the private practitioner of medicine in the development of preventive health service.

And that in the allocation of funds for any purpose in any localities the approval of the local medical profession be required The reference committee approves and emphasizes the principles that the problem of economic needs and the problem of providing medical care are not identical and should be approached separately

Your reference committee endorses and approves the proposal that the adequate administration and supervision of the health functions of the government as implied in the report of the special committee necessitates functional consolidation of all federal health and medical activities under a separate department.

And that the head of such department should be a doctor of medicine having the approval of the medical profession of the United States

Your reference committee recommends that a committee be appointed by the president of the Medical Society of the State of New York to formulate the principles and problems for a state health policy

For the establishment of a working definition of the term "adequate medical care"

And for the purposes of conferring with the government agencies and other organized medical groups so that differences in conception of definition of terms and applicability of principles and procedures may be ironed out in conference. This committee shall function for needs concerning the State of New York

It further recommends that the Medical Society of the State of New York urge the House of Delegates of the American Medical Association to create a group which shall formulate

Society Activities

Repeated inquiries have been made concerning the action taken May 24, 1937 by the House of Delegates of this State Society on what has been called "Principles and Proposals" Many of these questions betray a misunderstanding of the action, and it is, therefore, considered advisable to republish the pertinent portions of the minutes which originally appeared in the JOURNAL of July 1, 1937

PETER IRVING, M D, *Secretary*

• • •

National Public Health Policy

THE SPEAKER The chair recognizes Dr Booth For your information, gentlemen, this is a special committee appointed by President Winslow to make certain recommendations The Committee has met a number of times and Dr Booth as chairman of the Committee, is again reporting

DR. BOOTH, *Elmira* The Special Committee appointed by President Winslow to consider Provision of Medical Care begs to submit the following report

Principles

1 That the health of the people is a direct concern of the Government, and a national health policy, directed toward all groups of the population, should be formulated

"a In the formulation of such policy the opinions and suggestions of organized medicine should be given preference."

"b We recommend in line with the above principle that the Medical Society of the State of New York appoint a group to formulate the principles and proposals for a State Health Policy, and we also recommend that the Medical Society of the State of New York urge the House of Delegates of the American Medical Association to create a group which shall formulate the principles and proposals of a National Health policy to be submitted to the Government."

2 That adequate medical care is an essential element of public health, and local state and federal governments need to supplement present efforts of the medical profession in providing it.

"a. We recommend to the Medical Society of the State of New York that a Committee approved by the Council present a definition of the term "adequate medical care" for adoption by the House of Delegates, which shall be a "yard stick" in its use for all purposes connected with matters dealing with medical care, etc., henceforth."

"b That the House of Delegates of the Medical Society of the State of New York recommend to the House of Delegates of the American Medical Association the establishment of a working definition of the term "adequate medical care", suitable for the purpose of discussing national legislation and social legislation.

3 That the problem of economic need and the problem of providing adequate medical care are not identical and may require different approaches for their solution.

Your Committee understands principle No 3 to imply the following

"That the problem of providing the individual with the means for securing medical care—that is the economic needs—and the problem of distributing medical services are not identical, that these problems of economic needs should be approached separately from those of distributing medical services to the people."

Proposals

1 That the first necessary steps toward the realization of the above principles is to minimize the risk of illness by increasing preventive efforts through extension of public health services, federal, state and local.

"That the extension of federal, state and local preventive health measures is approved provided it meets the needs of a given situation in the opinion of the medical profession in the locality affected, and provided it integrates to the greatest possible extent the private practitioner of medicine in the development of preventive health service"

2 That an immediate problem is provision of adequate medical care for the medically indigent, the cost to be met from public funds. (This is in line with the provisions of the Booth Report of 1933)

3 That public funds should be made available for the support of medical education and for studies, investigations and procedures for raising the standards of medical practice. If this is not provided for, the provision of adequate medical care may prove impossible.

4 That public funds should be available for medical research as essential for high standards of practice in both preventive and curative medicine.

5 That public funds should be made available to hospitals that render service to the medically indigent and for laboratory diagnostic and consultative services.

With the provision—

That these consultative and laboratory diagnostic services shall be established only in regions where the medical profession approves

in official position in Washington, and the attention of constituent state medical associations was especially called to the action of the Board, as follows

"Recognizing that committees of the Senate and of the House of Representatives of the United States government and a special committee appointed by the President are at this time concerning themselves with the reorganization of government activities with a view to greater efficiency and economy, and recognizing also that the President, in his opening address to Congress, indicated that he would shortly present to the Congress recommendations for such reorganization of government activities in the executive branches, and recognizing moreover the great desirability that all activities of the federal government having to do with the promotion of health and the prevention of disease might with advantage be consolidated in one department and under one head, the Board of Trustees of the American Medical Association would recommend that such health activities as now exist be so consolidated in a single department which would not, however, be subservient to any charitable, conservatory or other governmental interest. It has been repeatedly said that public health work is the first problem of the state. It is the opinion of the Board of Trustees that health activities of the government, except those concerned with the military establishments, should not be subservient to any other departmental interests This reorganization and consolidation of medical departments need not, under present circumstances, involve any expansion or extension of governmental health activities but should serve actually to consolidate and thus eliminate such duplications as exist It is also the view of the Board of Trustees that the supervision and direction of such medical or health department should be in the hands of a competently trained physician, experienced in executive administration"

Since the House of Delegates during this session has already approved this action of the Board of Trustees, your reference committee deems it unnecessary to submit for your consideration that portion of the resolutions which deals with this subject

Your reference committee recognizes that certain principles stated in the resolutions presented by Dr Kopetzky have been considered by the House of Delegates on previous occasions and are matters of record These include, for example, the recognition of the primary importance of public health, the opposition to compulsory sickness insurance and the separation of the problem on economic need and the distribution of medical service.

The Board of Trustees has given careful consideration to the extension of medical service to the indigent, as indicated in the following statement, which was contained in the report of the Board of Trustees as printed in the Handbook and which was approved by this House during its session June 8, 1937

"In the past, the medical profession has always been willing to give of its utmost for the care of those unable to pay The available evidence indicates that today throughout the United States the indigent are being given a high quality of medical care and medical service. Nevertheless, the advances of medical science have created situations in which a group of the population neither wholly indigent nor competent financially find themselves under some circumstances unable to meet the costs of unusual medical procedures The Board of Trustees of the American Medical Association points out the willingness of the medical profession to do its utmost today, as in the past, to provide adequate medical service for all those unable to pay either in whole or in part Members of the medical profession, locally and in the various states, are ready and willing to consider with other agencies ways and means of meeting the problems of providing medical service and diagnostic laboratory facilities for all requiring such service and not able to meet the full cost thereof These are problems for local and state consideration primarily rather than problems of federal responsibility The willingness of the medical profession to adjust its services so as to provide adequate medical care for all the people does not constitute in any sense of the word an endorsement of health insurance, either voluntary or compulsory, as a means of meeting the situation"

The American Medical Association is cognizant of the medical needs of the people of the United States and is genuinely interested in all plans for providing and distributing medical care. The records, reports, source material and experience of the Association are of great value. They are at the service of agencies contemplating the development and operation of plans for medical care. These factual data, source material and experience are readily available for use in promoting and protecting the health of the American people.

Your reference committee recommends that the bureaus, councils and committees of the Association continue their studies of the need for and the methods of distributing medical care, to the end that the American Medical Association shall continue to do everything possible to promote and to protect the health of the American people.

The American Medical Association reaffirms its willingness on receipt of direct request to cooperate with any governmental or other qualified agency and to make available the information, observations and results of investigation together with any facilities of the Association

With respect to proposals for a National Department of Health, your reference committee refers to the report of the Board of Trustees in the Handbook, page 107, which has just been read.

Your reference committee believes this fully covers the subject

Respectfully submitted.

T A McGoldrick, Chairman
E F Cody
E H Cary
J H Fitzgibbon
J H Cannon

On motions, duly seconded and carried, the report of the reference committee was adopted section by section and as a whole

the principles and problems of a medical health policy to be submitted to the government.

And that the American Medical Association establish a working definition of the term "adequate medical care" suitable for the purposes of discussing medical and social legislation.

I move the adoption of this report.

(Motion seconded and carried.)

In accord with these instructions there was appointed by the President, with the approval of the Council, on June 17, 1937, a committee "On Matters Pertaining to Medical Care," charged with the following duties

1 To formulate the principles and problems for a State health policy

2 To establish a working definition of the term "adequate medical care"

3 To confer with government agencies and other organized groups so that differences in conception of definition of terms and applicability of principles and procedures may be ironed out

The Committee was directed to "function for needs concerning the State of New York" The personnel is Walter W Mott, M D, *Chairman*, Frederick M Miller, Sr, M D, David B Jewett, M D, James A Miller, M D, Charles D Post, M D, Louis A VanKleeck, M D, John E Wattenberg, M D, Homer L Nelms, M D, and William L Russell, M D

Advisory Committee Charles Gordon Heyd, M D, Frederick E Sondern, M D, Arthur W Booth, M D, Thomas A McGoldrick, M D, and Bertran W Gifford, M D

Already, after considerable preparatory study of the many different phases of the matter by the individual members, the Committee has had two discussion meetings, and in collaboration with the Council, is progressing steadily toward its objectives A final report will reach the next meeting of the House of Delegates on May 9, 1938

* * *

Also, as instructed, a resolution was introduced by the New York Delegation in the House of Delegates of the American Medical Association on June 7, 1937, as follows

Resolutions on the Development of a National Health Program

Dr Samuel J Kopetzky, New York, presented the following resolutions, which were referred to the Reference Committee on Executive Session

WHEREAS, The house of delegates of the Medical Society of the State of New York in annual session at Rochester, 1937, adopted certain resolutions which carried instruction to its delegates to the House of Delegates of the American Medical Association, and

WHEREAS, These resolutions concern the following principles and proposals anent the development of a national health program and the special circumstances under which the delivery of a high quality medical care to the American people may be evolved under conditions within the framework of adopted policy of the American Medical Association, and

WHEREAS, These principles and proposals are as follows

(Here followed exactly the same phraseology as presented in the New York Booth Committee report—see page 138)

Resolved, That the House of Delegates of the American Medical Association endorses the principles, proposals and recommendations just cited, and be it further

Resolved, That the House of Delegates authorize the formation of a committee which shall, in comformity to the above, formulate a national health policy for submission to the government, and further be empowered to confer with government agencies and also with any other medical groups so that differences in conception, definition of terms and applicability of principles and procedures may be ironed out in conference regarding those matters in the above principles and proposals which are of national scope and to the end that they may be enacted.

The course of this resolution is shown in the action on the Reference Committee's Report at Atlantic City on June 8, 1937

Report of Reference Committee on Executive Session

Dr Thomas A. McGoldrick Chairman, presented the following report

Your reference committee has carefully considered the Resolutions on the Development of a National Health Program, introduced by Dr Samuel J Kopetzky in behalf of the New York delegation, and has held hearings at which the details of the principles and proposals were freely discussed.

The Board of Trustees has already reported to this House of Delegates its considered opinion pertaining to the reorganization in one consolidated department, of the activities of the federal government having to do with the promotion of health and prevention of disease Copies of this statement, as printed in *The Journal* [*A M A*] and in the Handbook of the House of Delegates were transmitted to the President of the United States and to others

Yerushalmy himself was surprised when he discovered that the father's age apparently influences the survival of his offspring The influence followed closely that already found to be exercised by the mother's age Perhaps it is due to the fact that young women usually marry young men? But no! "When age of mother is held constant the variation of neonatal mortality with age of father is very marked. the optimum age of father for first and second births is 25-29"

This interesting paper has not yet been published, but of course it will be. Requests for reprints may be addressed to Dr Jacob Yerushalmy at the New York State Department of Health or to the editorial office of this JOURNAL.

SERUM IN PNEUMONIA

That the physicians of the State may have concrete examples of different phases of antipneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of antipneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Cases 10 and 11

Reports from the records of Dr George B Van Doren, Watertown, and Dr Joseph Kriegler, Lackawanna

"D D, a forty-eight year old white male adult was perfectly well until February 12, 1937 when he had an onset of a shaking chill followed by fever, prostration, and a cough productive of mucopurulent sputum The patient felt very anxious about his condition, and on the day following the onset of his illness, February 13, he called his physician who had him admitted to Mercy Hospital, Watertown.

"On admission the patient was extremely ill with a temperature of 103°, pulse of 96, and respirations of twenty-eight Physical examination of the chest revealed slight dullness and moist rales over the entire right side anteriorly and posteriorly with a few rales heard over the upper portion of the left side of the chest A diagnosis of bronchopneumonia was made and the sputum was immediately typed Pneumococcus type I was found and the patient was tested for serum sensitivity At 5 P M on the day of admission, the second day of illness, the first dose of forty c c (50,000 units) of type I antipneumococcus serum was given intravenously 'Directly after the first dose of serum the patient's condition began to improve.' At 1 A M on the morning of the third day, February 14, another dose of forty c.c. (50,000 units) and at 10 A M twenty c.c (25,000 units) were given The patient's temperature fell constantly by lysis and became normal on the morning of the fifth day, February 16 At the same time the patient's general condition continued to improve, while pulse and respirations gradually fell to normal

"From that time convalescence was uneventful and on February 23, the patient was discharged from the hospital, at which time the cough and expectoration had completely disappeared and physical examination of the chest was negative"

* * *

"Y S, a fifty-three year old male adult felt perfectly well except for a slight unproductive cough for two days duration, until April 3, 1937 when he had an onset of severe shaking chill followed by fever and difficulty in breathing On that day the patient's physician found signs of patchy pulmonary involvement, and a diagnosis of bronchopneumonia was made. The patient was immediately hospitalized. There was difficulty in obtaining a satisfactory specimen of sputum for typing until April 5, when a type I pneumococcus was recovered During that interval the patient had become progressively worse so that at the time serum was started (April 5) on the third day of the disease, the patient was in very poor condition There was marked delirium, a severe grade of abdominal distension, signs of diffuse bilateral patchy pulmonary involvement, and the patient had to be catheterized at regular intervals The temperature was 103 8, pulse 104, and respiration thirty Serum therapy was started at 3 P M on the same day One hundred thousand units of type I antipneumococcus serum were given during the following twelve hours The patient improved rapidly, and the following morning, April 6, the fourth day of the

New York State Department of Health

The department was represented at Atlantic City on December 28, when the American Statistical Association held its ninety-ninth annual meeting, by Jacob Yerushalmy, Ph D of the division of Maternity, Infancy, and Child Hygiene

Dr Yerushalmy presented a paper on neonatal deaths and has used material supplied by hundreds of New York physicians during 1936 to distill by statistical procedure conclusions of great interest to biology, sociology, and preventive medicine His study is symbolical of the progress which may be won by cooperation between clinical observers in private practice and state employees like ourselves Previous studies on neonatal mortality have been made mostly by obstetricians with a strictly limited series of cases and their conclusions have been subject always to the limitations which statistics must suffer when they operate upon a small number of observations

Dr Yerushalmy has had the advantage of the data obtained from 82,138 birth certificates and 2,566 certificates of death for babies less than four weeks old, all relating to events in 1936 He must be given credit for originality in combining the information from both the death certificate and the birth certificate on a single punch-card This procedure has made possible the mechanical sorting and tabulation of data from this very large experience Accompanying is one of the tables obtained.

Frequency of Premature Births, and Neonatal Mortality for Full-Term and Premature Infants by Order of Birth New York State (Exclusive of New York City), 1936

Order of Birth	Frequency of Premature Births*	Neonatal Mortality Rates*		
		Premature Births	Full-Term Births	Full Term Single and Legitimate Births
1	49 2	329 4	16 8	16 5
2	37 9	389 6	11 6	11 3
3	36 1	393 9	12 6	12 1
4	37 6	403 7	15 0	14 7
5	36 0	524 7	20 0	19 0
6 & 7	51 5	481 2	16 5	15 9
8 & 9	46 1	490 6	18 2	16 4
10 & over	49 8	644 4	24 4	22 0
Total	42 9	389 0	15 2	14 7

* Per 1 000 live births in each specified group

Notice in this table (a) the very great difference in neonatal mortality between full-term and premature infants (a striking justification of the current campaign by Dr Julius Hess), (b) the higher risk both of prematurity and of neonatal death suffered by first babies (but premature first babies seem to suffer no extra risk!), (c) the increasing risk both of prematurity and of neonatal death with multiparity

Neonatal mortality has not decreased in New York State or elsewhere as rapidly as has infant mortality In this state, exclusive of New York City, there has been in the last twenty years a reduction of sixty-six per cent in the death rate of infants aged one month to one year and only thirty-six per cent in neonatal mortality More than half of these neonatal deaths are of infants prematurely born More than half of them occur within twenty-four hours of birth Improvement of the extrauterine environment cannot be expected greatly to modify their fate In seeking to reduce this mortality we look, therefore, for significant factors in the health of the mother as well as to improvements in obstetrical technique We suspect that too many and too frequent pregnancies are harmful Dr Yerushalmy's statistics confirm this suspicion and add the information that too great a spacing of pregnancies is also deleterious We suspect that older mothers may be less successful mothers Dr Yerushalmy tells us that this is so not only because older mothers have borne several children but also because of their age whether they have borne children or not. Dr Yerushalmy isolates (statistically speaking) a group of mothers who begin bearing children at a very early age and who, with exceptional fertility, continue to give birth at short intervals The group is responsible for a relatively high proportion of neonatal deaths and demands more than ordinary exercise of antenatal care

We look, as I have written, for significant factors in the health of the mother But most of us would not have looked so carefully at the health of the father Dr

Yerushalmy himself was surprised when he discovered that the father's age apparently influences the survival of his offspring The influence followed closely that already found to be exercised by the mother's age Perhaps it is due to the fact that young women usually marry young men? But no! "When age of mother is held constant the variation of neonatal mortality with age of father is very marked the optimum age of father for first and second births is 25-29"

This interesting paper has not yet been published, but of course it will be Requests for reprints may be addressed to Dr Jacob Yerushalmy at the New York State Department of Health or to the editorial office of this JOURNAL.

SERUM IN PNEUMONIA

That the physicians of the State may have concrete examples of different phases of antipneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of antipneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Cases 10 and 11

Reports from the records of Dr George B Van Doren, Watertown, and Dr Joseph Kriegler, Lackawanna.

"D D, a forty-eight year old white male adult was perfectly well until February 12, 1937 when he had an onset of a shaking chill followed by fever, prostration, and a cough productive of mucopurulent sputum The patient felt very anxious about his condition, and on the day following the onset of his illness, February 13, he called his physician who had him admitted to Mercy Hospital, Watertown

"On admission the patient was extremely ill with a temperature of 103°, pulse of 96, and respirations of twenty-eight Physical examination of the chest revealed slight dullness and moist rales over the entire right side anteriorly and posteriorly with a few rales heard over the upper portion of the left side of the chest A diagnosis of bronchopneumonia was made and the sputum was immediately typed. Pneumococcus type I was found and the patient was tested for serum sensitivity At 5 P M on the day of admission, the second day of illness, the first dose of forty c.c. (50,000 units) of type I antipneumococcus serum was given intravenously 'Directly after the first dose of serum the patient's condition began to improve' At 1 A M on the morning of the third day, February 14, another dose of forty c.c (50,000 units) and at 10 A M twenty c.c. (25,000 units) were given The patient's temperature fell constantly by lysis and became normal on the morning of the fifth day, February 16 At the same time the patient's general condition continued to improve, while pulse and respirations gradually fell to normal

"From that time convalescence was uneventful and on February 23, the patient was discharged from the hospital, at which time the cough and expectoration had completely disappeared and physical examination of the chest was negative."

* * *

"Y S, a fifty-three year old male adult felt perfectly well except for a slight unproductive cough for two days duration, until April 3, 1937 when he had an onset of severe shaking chill followed by fever and difficulty in breathing On that day the patient's physician found signs of patchy pulmonary involvement, and a diagnosis of bronchopneumonia was made The patient was immediately hospitalized There was difficulty in obtaining a satisfactory specimen of sputum for typing until April 5, when a type I pneumococcus was recovered During that interval the patient had become progressively worse so that at the time serum was started (April 5) on the third day of the disease, the patient was in very poor condition There was marked delirium, a severe grade of abdominal distension, signs of diffuse bilateral patchy pulmonary involvement, and the patient had to be catheterized at regular intervals The temperature was 103 8, pulse 104, and respiration thirty Serum therapy was started at 3 P M on the same day One hundred thousand units of type I antipneumococcus serum were given during the following twelve hours The patient improved rapidly, and the following morning, April 6, the fourth day of the

disease, the temperature was 97, pulse 80, respiration eighteen, and general condition was good. The mental symptoms and abdominal distension rapidly disappeared, convalescence was uneventful, and patient was discharged well on April 23"

The above cases are examples of the value of specific antipneumococcus serum in the treatment of bronchopneumonia caused by type I pneumococcus They illustrate the fallacy of the disappearing but still prevalent misconception that serum is only of value in the treatment of lobar pneumonia

The traditional distinction between lobar and bronchopneumonia is important as far as the niceties of accurate anatomical physical diagnosis are concerned However, the etiological diagnosis is much more important since the intelligent treatment of the patient depends upon it Furthermore, it is often very difficult and at times impossible by either physical examination or chest plate to ascertain the anatomical conformation of the lesion Indeed, on pathological examination, one not infrequently finds both types of anatomical lesions due to the same microorganisms in the same patient

While it is true that pneumococci of the "treatable types" (I, II, V, VII, and VIII) are found more commonly in lobar pneumonia, these microorganisms are more frequently found as the etiological agents of bronchopneumonia than is commonly realized It is steadily becoming more widely recognized that in every case of pneumonia, irrespective of its anatomical form, a sputum specimen should immediately be sent to the laboratory for bacteriological study, and if a treatable type is recorded, serum should be administered in the usual manner

MEDICAL EDUCATION

The following course on "The Treatment of Common Diseases" was arranged by Dr Clayton W Greene for the Columbia County Medical Society All lectures start promptly at 8 45 P M and are given at the Hudson City Hospital in Hudson

December 20 "Measures for the Relief of Distress Following Meals" by Dr A H Aaron

January 10 "Treatment of Edema" by Dr N G Russell

January 24 "What Can we do for Angina Pectoris and Coronary Occlusion" by Dr C W Greene.

February 7 "Dyspnea and Its Treatment" by Dr Elmer H Heath

February 21 "Modern Methods in the Treatment of Anemia" by Dr F D Leopold

March 7 "Diagnosis and Treatment of Unconscious States" by Dr Edward A. Sharp

A NEW WAITING ROOM RACKET

Two men, in their early thirties, entered the waiting room of a New York doctor The one wearing a chauffeur's cap introduced the other as his cousin, explaining that he drove a truck for a contracting banqueteer, and that as they needed help, he had gotten his cousin a job However, his boss, before putting him to work, required a certificate for food handling, so he wanted his cousin examined

They went into the doctor's examining room, according to the story in the *Roentgen Economist*, and the cousin removed all his clothing for examination, the man who had been wearing the chauffeur's cap kindly assisting in the removal During the examination, while the examinee still undressed, the man who had been wearing the cap muttered something about a truck, and started for the door, the examinee calling for him to wait a minute.

With the information to the doctor that he would be right back, the man with the cap stepped out, apparently to make a hurried return The examinee was trying to get his pants on, and implored the doctor to stop him, to call the police, "He has picked my pocket" Of course, the man with the cap was lost in the street.

It seems the man with the chauffeur's cap had approached the other, saying that he needed a good man on the truck, that he could give him the job if his references were good Liking him, to help him, he decided to tell his employer they were cousins He went to the telephone and supposedly got permission to put his cousin to work if he got a doctor's certificate

Giving the examinee the opinion he was taking him to his own physician, he had picked his pockets, during the examination, getting $13, and leaving the victim naked

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

SCHENECTADY COUNTY WOMAN'S Auxiliary will have been organized one year this January and will celebrate its anniversary at a dinner

Dr Chas A. Goodrich on January 4th attended a joint meeting of Cayuga, Madison, Jefferson and Onondaga Auxiliaries held in Syracuse Dr William A. Groat, President Elect, was introduced by Dr Goodrich and discussed his paper

Cayuga County held its December annual meeting at City Hospital Mrs Harry Bull presided A large representative group attended. The new officers elected are President, Mrs Raymond Johnson First Vice President, Mrs G C Sincerbeaux. Second Vice President, Mrs Bernard Cullen Treasurer, Mrs L B Sisson Recording Secretary, Mrs L J Iacovino Corresponding Secretary, Mrs M L Seccomb

The meeting was addressed by Dr G B Adams, Director of the Cayuga County Laboratory, who gave an informal talk about his life in the south He told of his work in connection with the Rockefeller Foundation in fighting the "hookworm" in the deep south, and related many interesting things which happened during his professorship in Emory College at Atlanta, Ga

* * *

With the arrival of the new year we all look back upon the achievements of the one just passed. We, of the Woman's Auxiliary to the Medical Society of the State of New York, feel proud of our growth and the work we have done It might be well at such a time to review our history briefly from our beginning

In Albany, at the 1935 Annual Meeting of the Medical Society of the State of New York, Dr Arthur J Bedell appointed Mrs John L Bauer as the Organizing President for the Woman's Auxiliary to the Medical Society of the State of New York. This appointment was confirmed by Dr Frederic E. Sondern, his successor

In 1933, the Auxiliary to the Medical Society of Queens was founded, and the year 1935 brought in two new counties Albany County was organized with Mrs R. A. Lawrence as President and Kings County with Mrs John L Bauer as President.

Organization work was undertaken by writing each of the fifty-eight county Medical Societies that had no Auxiliaries and twenty-three were personally contacted

The first to respond was Cayuga County on January 16, 1936, Mrs H. S Bull as President. Nassau came next on January 21, and Mrs Albert M Bell was elected President Onondaga County followed on February 12 with Mrs Francis R Irving, President.

Albany County had by this time disbanded

A meeting was called of the five County Auxiliaries and on March 11, 1936 the State Auxiliary was formed Mrs John L Bauer was elected President and Mrs Francis R. Irving, President-Elect. The A.M A Convention was held at Kansas City at which the President read the report of New York State

On August 4, Suffolk County formed an Auxiliary with Mrs H Barnhardt, President. Rockland County organized November 4, 1936 with Mrs S W S Toms, President

At the February executive board meeting held at the home of the President, the Organizing Chairman reported Orange County Auxiliary, December 14, Mrs J Emerson Noll, President, also Schenectady County Auxiliary, January 14, Mrs Herman Galster, President.

On December 10, Madison was organized, Mrs Robert L Crockett, President, Saratoga, December 12, Mrs G Scott Towne, President, and Columbia County Auxiliary April 1937, Mrs Henry Galster, President.

The Second Annual Convention of the State Auxiliary was held at Rochester, May 24–26, 1936 Reports were read by the officers and Presidents of the County Auxiliaries Mrs Francis Irving took office as president and Mrs Daniel Swan, President-Elect.

The Woman's Auxiliary to the A M.A Convention was held at Atlantic City, June 7–11, 1937 The President, Mrs Francis Irving read the report for the State A membership of over 900 was reported

The Second Executive Board meeting for

disease, the temperature was 97, pulse 80, respiration eighteen, and general condition was good. The mental symptoms and abdominal distension rapidly disappeared, convalescence was uneventful, and patient was discharged well on April 23"

The above cases are examples of the value of specific antipneumococcus serum in the treatment of bronchopneumonia caused by type I pneumococcus They illustrate the fallacy of the disappearing but still prevalent misconception that serum is only of value in the treatment of lobar pneumonia

The traditional distinction between lobar and bronchopneumonia is important as far as the niceties of accurate anatomical physical diagnosis are concerned However, the etiological diagnosis is much more important since the intelligent treatment of the patient depends upon it Furthermore, it is often very difficult and at times impossible by either physical examination or chest plate to ascertain the anatomical conformation of the lesion Indeed, on pathological examination, one not infrequently finds both types of anatomical lesions due to the same microorganisms in the same patient.

Medical News

Albany County

THE ANNUAL DINNER OF THE Albany County Medical Society was held at the DeWitt Clinton on Dec. 8 After the dinner the doctors heard "The Whole Story of Clinical Research in a Nutshell," by Dr Reginald Fitz of Boston University, with lantern slides

THE ANNUAL LUNCHEON MEETING of the Visiting Nurses Association and the Public Health Committee of the Albany County Medical Society was held at Trinity M E Church, Jan 11

The guest speaker was Dr Henry F Vaughn, commissioner of health of Detroit, and his subject, "New Developments in Preventive Medicine" He emphasized tuberculosis and syphilis control

Broome County

AT THE ANNUAL MEETING of the Broome County Medical Society held December 14 the following Officers, Chairmen of Committees, Censors, Delegates, and Compensation Board were elected

Officers

President	Chas L. Pope, Binghamton
Vice-President	Chas M Allaben, Binghamton
Secretary	R. C Bates, Binghamton
Asst. Secretary	M H Williams Binghamton
Treasurer	E. R. Dickson Binghamton
Asst. Treasurer	E M. Jones, Endicott

Chairman of Committees

Economics	H. I Johnston, Binghamton
Legislation	C. J Longstreet, Binghamton
Library and History	S B Blakely, Binghamton
Membership	C. H Berlinghof, Binghamton
Milk Committee	P H Shaw, Binghamton
Public Relations	B A Buell, Binghamton
Public Health	G S Lape, Binghamton

Censors

S B Blakely — F M Dyer
J J Cunningham — S D Molyneaux
Chas D Squires

Delegates

S M. Allerton — G C. Vogt
C. H Berlinghof — R. J McMahon

Compensation Board

Wm. H. Hobbs — G W Danton
Chas. D Squires

Delegates

S M. Allerton — C H Berlinghof

Alternate Delegates

G C Vogt — R J McMahon

Dr Arthur Cummings District State Health Officer, discussed the "General Aspects of Health Administration" The paper was discussed by Drs C J Longstreet, W J Farrell, and Mark Welch —*Reported by Victor W Bergstrom, M.D , Secretary*

Cayuga County

AT THE ANNUAL MEETING of the Medical Society of the County of Cayuga, held December 16, the following officers were elected for 1938

Officers

President	Lillian A Treat, Auburn
Vice-President	William R. Johnson Cato
Secretary	Stephen J Karpenski, Auburn
Treasurer	William A. Tucker Auburn

Delegate to the State Society Convention
Harry S Bull
Alternate Delegate
Raymond C Almy

Delegate to the Seventh District Branch
Alfred K Bates
Alternate Delegate
Walter B Wilson

—Reported by S J Karpenski, M D , Secretary

Chautauqua County

DR. C E HALLENBECK of Dunkirk was elected president of the Chautauqua County Medical society at the annual meeting held in Hotel Jamestown on Dec 15

Forty-five members from all parts of the county were present for the dinner and the business session which followed.

Other officers chosen were

1st Vice-President	D W Buckmaster Jamestown
2nd Vice-President	Harry E. Wheelock, Fredonia
Secretary	Edgar Bieber, Dunkirk
Treasurer	F J Pfisterer, Dunkirk

Censor
Van S Laughlin

Delegate to State Society (2 years)
D W Buckmaster

The principal speaker was Dr Ramsdell Gurney of the Buffalo General hospital staff who discussed "Present Day Treatment of Pneumonia"

An address on "School Health" was delivered by Dr William P Brown, specialist for the state department of education, division of health and physical education.

Chenango County

DR NORMAN C LYSTER of Norwich was elected president of the Chenango County Medical Society at the annual meeting on Dec. 14 at the Norwich Club

Other officers named were

1937 was held September 28 at the summer home of Mrs John L Bauer in Bayport Plans were started for the Annual Convention which will be held at the Waldorf-Astoria.

The President and Mrs John L Buettner, State Chairman of Organization, report Jefferson County organized on November 11, 1937, with Mrs Harlow Farmer, President

CANCER CONTROL

The Women's Field Army, which is the educational arm of the American Society for the Control of Cancer, is already actively engaged on its winter campaign culminating in a drive for enlistments in the Army to fight cancer at one dollar a year during the month of April Although this drive represents the climax of the campaign the Army carries on an active educational program throughout the year

Physicians are frequently asked to lend their aid by speaking before groups of women—or men—on the recognition of early or suspicious signs of the disease In this connection we suggest to our readers that the officers of the Women's Field Army have merited the full support of the medical profession in their sane, well-organized effort to bring within reach of the people of this state a knowledge of the early signs of cancer sufficient to enable them to recognize the possible significance of conditions which should bring them promptly to the consulting room of a reputable physician The people need, too, the assurance from the physician that an encouraging and ever increasing number of cases can be permanently cured if discovered in time

At present far too many persons, on the discovery of an apparently trifling condition which suggests to them the possibility of cancer conceal their suspicions until—if the trouble prove to be indeed malignant—all hope of permanent cure has passed

Others are led to consult some irregular practitioner attracted by his boast that he "never uses a knife" It is only an intelligent understanding of the nature and behavior of the disease that can protect people from acceptance of such misleading statements

In each one of the forty-one state organizations of the Women's Field Army the plan of campaign, as well as the expenditure of seventy per cent of all moneys collected, is carried on with the advice and under the direction of an Executive Committee, the nucleus of which is the Cancer Committee of the State Medical Society if the Society has such a committee Otherwise medical guidance is afforded by a group of physicians selected because of especial interest in the problems of cancer, from among the members of the State or County Medical Society

The organization of the Army itself consists of a line of officers ranging from the state (or city) Commander down through regional Captains, community Lieutenants, and local Sergeants, to the soldiers in the field The actual work of securing enlistments, of arranging for educational talks or exhibits, the distribution of literature, etc, is done under the immediate direction of the Sergeants

At every step in which medical guidance has been needed the Army has turned to the organized profession for leadership There is every reason, therefore, why the medical profession should lend its fullest support and all possible aid to this worthy endeavor to place the results of recent research in the hands of those who can most directly profit by the newer knowledge of cancer, thereby helping to lessen the wastage of useful lives through unnecessary deaths from cancer

The Commander of the Women's Field Army in this State is Miss Harriet W Mayer, 169 No Fulton Ave, Mount Vernon and the Chairman of the Executive Committee is Dr Louis C Kress, 113 High St, Buffalo

---

One of the sanatorium physicians received a telephone call from another member of the staff, who invited him to make a fourth at bridge

"Going out, dear?" asked his wife sympathetically

"I'm afraid so" was the grave reply "It's a very serious matter There are three doctors there already"—*Colorado Medicine*

The Patient "Doctor, I snore so loudly I wake myself up"

The Doctor "That's easy to overcome Sleep in the next room"—*Colorado Medicine*

of Hitlerism He explained he was too busy masticating food after a twenty-four hour fast. The Chair read a telegram of regret from Dr Stephen A. Graczyk, and a poem by Dr Julius Richter, both of whom were out of the city Arrangements are under way for the formation of another class

Fulton County

Dr. Homer H. Oaksford was elected president of the Medical Society of Fulton County at the annual meeting on Dec. 16 He succeeds Dr Claude Bledsoe Others elected are

Vice-President	John A Shannon, Johnstown
Secretary	Louis Tremante Gloversville
Treasurer	J D Vedder, Johnstown

Censors

Woodward Shaw William J Kennedy
Sidney J Colton

Delegate to the State Convention

D S C Clemans

Alternate Delegate

D Claude Bledsoe

Genesee County

The annual meeting of the Genesee County Medical Society was held on December 17, at the Hotel Richmond, Batavia The following officers were elected

Officers

President	W C Swasey, Batavia
Vice-President	G H Knoll, Le Roy
Secretary Treasurer	P J Di Natale, Batavia

Delegate to the State Society

P J Di Natale (two years)

—Reported by P J DiNatale, M D , Secy

Herkimer County

Dr. James F Gallo, of Herkimer, was elected president of the Medical Society of the County of Herkimer at the annual meeting and dinner at the Mayfair Grill, on Dec. 14

Other officers named are

Officers

First Vice-President	George A Burgin, Little Falls
Second Vice-President	George J Frank, Frankfort
Third Vice-President	Harry W Vickers Little Falls
Secretary	Fred C. Sabin Little Falls

Jefferson County

The regular meeting of the Medical Society of Jefferson county was held on Dec. 9 at the Black River Valley club

Dr W J Merle Scott, associate professor of surgery at the Strong Memorial hospital, Rochester spoke on "The Peptic Ulcer Problem" Dr Robert J Mearin, recently assistant physician in charge of the insulin therapy clinic at Creedmore State hospital spoke on "Insulin Therapy in Dementia Precox to Date"

Kings County

For the first time in fifteen years, the Kings County Medical Society rejected a regular candidate for president at the annual elections on Dec 21 and chose an independent candidate, Dr Philip I Nash, chief surgeon of the Coney Island Hospital

Dr Nash received 937 votes and Dr Robert F Barber, chief surgeon of the Polhemus Memorial Clinic of the Long Island College Hospital, who was selected by caucus as the regulate candidate, received 669 The selection of Dr Nash, says the New York *Times* was hailed by his supporters as a victory for the younger and more liberal wing of the society over the conservative element

The elections, held in the MacNaughton Auditorium, were for the selection of officers for 1939, the society's rules requiring that officers be chosen a year ahead of their terms Dr John B D'Albora will be president in 1938, succeeding Dr Thomas A McGoldrick, chief surgeon of the Police Department.

Dr Nash was put up for the presidency by the liberal element in the society according to the press, and in his campaign for election he said he had been accused of communism, a charge that he denied He said he favored the establishment of a central registry bureau through which the indigent sick could be referred to the various dispensaries

Also he advocated that the society spend sufficient money for adequate social service investigators to exclude from dispensaries all except those who are unable to pay for the services of a private physician Further he favored the establishment by the society of a plan for old age and sick insurance.

The presidency was the only office on which the members of the society had a choice of candidates, the rest of the regular ticket being unopposed.

Other officers elected for 1939 were

Officers

Vice-President	Joseph Raphael, Brooklyn
Secretary	Thomas B Wood, Brooklyn
Associate Secretary	Benjamin M Bernstein Brooklyn
Treasurer	Maurice J Dattelbaum Brooklyn
Associate Treasurer	Arthur C Holzman Brooklyn
Directing Librarian	Jacques C Rushmore, Brooklyn
Associate Directing Librarian	Edwin P Maynard, Jr Brooklyn

Trustees

Augustus Harris Alexander L. Louria
Thomas A. McGoldrick

Officers

Vice President — D U Gould, Sherburne
Secretary and Treasurer — John H Stewart, Norwich

Censor

Carl D Meacham (three years)

Delegate to the State Association Meeting

W H Mason

Cortland County

THE MEDICAL SOCIETY OF the County of Cortland elected these officers at the December meeting

Officers

President — Wm A. Shay, Cortland
Vice President — Robert Carpenter, Cortland
Treasurer — Bert R Parsons, Cortland
Secretary — Daniel R. Reilly, Cortland

Censors

John E Wattenberg — Merle R. French
Chas D Ver Nooy — Claude E Chapin
Arthur M Loope

—Reported by Orton E White, M D, Secretary

SERVICES OF A CITY PHYSICIAN in Cortland are to be discontinued and indigent patients will be given a choice of doctors, it was announced at the meeting In the past it has been necessary for patients on relief rolls to call the city physician in case of illness but the change, announced by Mayor George C Marsted and City Welfare Commissioner Thomas Walsh will give relief families an opportunity to have a family doctor

Erie County

AT THE ANNUAL MEETING of the Medical Society of the County of Erie on December 20, the following physicians were elected to office

Officers

President — Harry C Guess, Buffalo
First Vice President — Carlton E. Wertz Buffalo
Second Vice-President — Herbert E. Wells Buffalo
Secretary — Louise W Beamis Buffalo
Treasurer — Caryl A Koch, Orchard Park

Censors

Charles W Bethune — Francis E. Fronczak
Francis J Butlak — Michael A Sullivan
Abram L Weil

Chairmen of Committees

Legislation — James L. Gallagher
Public Health — Nelson W Strohm
Economics — L. Franklin Anderson
Membership — Allen R. Long

Delegates for 1938–1939

Albert A Gartner — John T Donovan
Herbert H Bauckus — Joseph C. O Gorman

Alternate Delegates

Alfred H Noehren — Stephen L. Walczak
Edward J Lyons — Samuel Varco

—Reported by Louise W Beamis, M D, Secretary

SPEAKING OVER STATION WEBR December 9, Dr John T Donovan, President of the County Society, called attention to the widespread sale of salacious books and magazines and its evil effects upon the mental and physical health of the youth of the community A diseased brain leads to a diseased body, he said, and hastens tuberculosis and a train of other diseases He commended the Buffalo *Evening News* in its campaign to halt the nefarious traffic which, he said, is comparable to the illicit traffic in narcotic drugs He urged mothers' clubs, parent-teacher organizations and other bodies to back up the police in the enforcement of laws prohibiting the distribution and sale of obscene publications, in the interests of health

THE TENTH AND FINAL MEETING of the 1937 course of instruction in public speaking, sponsored by Dr Harry C Guess, Chairman of the County Society's Educational Committee, was held the night of December 9 Twenty-one members of the class, despite the inclement weather, braved the blizzard to pay tribute to their instructor, Stanley D Travis, Professor of English at the University of Buffalo, and in holiday spirit tendered him a dinner in appreciation of his success in speeding them along the road to silver-tongued oratory

Highlights in impromptu talks at the dinner, on topics assigned by the toastmaster, was a discourse on the distinction between prickle and tickle in the scientific administration of electrotherapy, by Dr Tamara von Friesen, whose lifework is dedicated to the alleviation of human ills by physical therapy Dr Archibald S Dean, State Director of Health, and an authority on the science and art of producing twins, described, with due apologies to papa Dionne, the technic necessary to engineer a little slam His procedure was not disputed by Dr Guess, also the father of twins Dr Lee Anderson, song leader, refused to depart from his cherished topic, and told how pleasantly nurse anesthetists can fall asleep in the midst of an operation Dr C L Suess of Lancaster (U B 1903) related his experience in a case of obstetrics delayed one month beyond the allotted time Finally, the stethoscope disclosed the cause of the delay—twins—engaged in polite conversation "You go first Alphonse—No after you, Gaston" Dr Samuel Varco, master of ceremonies, took time out from his advocacy of the extension of Prospect avenue to Niagara street, contrary to the views of Dr Horace Muscato, to demonstrate the science of belly breathing as an aid to fluency of speech Dr Arthur Weinman asked to be excused from a discussion

Officers

Vice-President Nicholas L. Ardan, Niagara Falls
Secretary Treasurer Forrest Barry, Lockport

Censors

Theodore Mueller Roy Wixson
R R. B Fitzgerald

Delegates to State Medical Society Convention

Richard H Sherwood Guy S Philbrick

Dr George presided at the meeting which followed a subscription dinner at which the two speakers of the evening were guests of honor

The speakers were Dr Frederic Elliott, chairman of the economics committee of the New York State Medical society, and Dr David J Kaliski, director of the state association's committee on Workmen's Compensation

Onondaga County

AT THE ONE HUNDRED AND THIRTY-FIRST annual meeting of the Onondaga Medical Society on Dec 7 in Syracuse at the University Club, Dr Oliver W H. Mitchell was elected president. Reports on several current health and medical problems were given by chairmen of the various standing committees

Other officers elected were

Officers

Vice President Leon E. Sutton, Syracuse
Secretary Dwight V Needham Syracuse
Treasurer James F Cahill, Syracuse

Delegate to the State Society

John J Buettner

Censors

P K. Menzies Wardner D Ayer

Delegates to the Fifth District Conference

Raymond J Piert George L Wright

ELECTION OF OFFICERS AND annual reports of officers and committees featured the annual meeting of the Syracuse Academy of Medicine on Dec 21 at the University Club

Speakers were Dean Herman G Weiskotten on "Trends in Medical Education", Dr Lee A. Hadley with a case report on the Schuller Christian disease, Dr Robert D Johnson on "Oesophageal Dilation Accompanying Cardiospasm", and Dr Frederick N Marty on "Malarial Infection Following Transfusion" Dr Edward J Wynkoop discussed Dr Hadley's case report.

Orange County

AT THE ANNUAL MEETING of the Medical Society of the County of Orange on Dec. 18, the following were elected

Officers

President Harry F Pohlmann, Middletown
Vice President Harold F Morrison, Tuxedo
Secretary Treasurer E. C Waterbury, Newburgh

Censors

E G Cuddeback Roswell L Schmitt
Walter G Hirsemann Daniel I O'Leary

Delegate to State Society for 1938–39

Moses A. Stivers

Alternate Delegate for 1938–39

James C. Donovan

DR. JESSE G M BULLOWA, attending physician at Harlem and Willard Parker Hospitals addressed the Rockaway Medical Society on Dec. 16, in the Inwood Country Club on "Pneumonias" Dr Louis A. Sarrow presided The talk was illustrated with both lantern slides and motion pictures The society will hold its fifteenth anniversary dinner-dance on Jan. 22, in Henri's Lynbrook. Dr A. S Tepper is chairman. Assisting him are Doctors I M. Siegel, Edward Richter, A Vivona, Samuel Dillon, and William Werner

THE QUEENSBORO CHAMBER OF COM-

The following program was given at the scientific session

"Fever Therapy with Special Reference to Gonococcal Infection" (Illustrated with colored motion pictures) Addresses were by Charles M Carpenter, M D, and Stafford L Warren, M D

PRELIMINARY PLANS FOR THE canvassing of Brooklyn industrial establishments to ascertain the health facilities now provided for factory workers in the borough are under consideration by the public health committee of the Brooklyn Chamber of Commerce

The survey is designed to assist in the establishment of adequate health facilities for employees in Brooklyn's 4,490 factories

Dr Alfred E Shipley has been chosen to head a subcommittee in charge of the project. At present head of the Department of Preventive Medicine and Community Health at the Long Island College of Medicine, Dr Shipley, was until recently, Deputy Commissioner of Hospitals for New York City

In outlining the plans for the survey Dr Shipley announced that the canvass would have two functions First, it would seek to determine what is being done now for workers in Brooklyn industries in the way of medical examinations, treatment for injuries suffered at work and illness whether suffered at work or elsewhere, also to find out what establishments cannot afford treatment for workers and what can afford it, but have failed to provide the treatment

The second purpose will be the devising of a health service plan for workers that will provide examinations, treatment and advice as to the establishment of healthful working conditions at a cost within the reach of even the least prosperous companies

THE WILLIAMSBURG MEDICAL SOCIETY met on Jan 10 at the Jewish Hospital The program "The Roentgen Diagnosis of Pulmonary Tuberculosis," Henry K Taylor, M D Discussion by Gilbert Alexander, M D "Radiation Therapy for Non-Malignant Conditions," I Seth Hirsch, M D "The Radio-Curability of Cancer," Maurice Lenz, M D Discussion by M G Wasch and W E. Howes

The Urological section met on Jan 11 at 1313 Bedford Ave and heard a paper on "A Urological Clinic," by J Dellinger Barney, M D, Boston

THE EAST NEW YORK Medical Society met on January 3, in the Temple Auditorium The following addresses were given "Diagnosis and Treatment of Congenital Syphilis," Thurman B Givan, M.D, "Tertiary Cutaneous Syphilis, Including Treatment," Isadore Rosen, M D

Montgomery County

THE FOLLOWING WERE ELECTED to office for 1938 at the annual meeting of the Medical Society of the County of Montgomery

Officers

President	Edward A. Bogdan Amsterdam
Vice-President	Henry C. Young Hagaman
Treasurer	S L. Homrighouse, Amsterdam
Secretary	W R. Pierce, Amsterdam

Censors

R. C Simpson W H. Seward
William R. Rathbun

State Delegate
H M Hicks

Alternate Delegate
P J Fitzgibbons

Delegate to Fourth District Branch
E C LaPorte

New York County

DR. SAMUEL Z LEVINE, Professor of Pediatrics at Cornell University Medical College, will speak on "Recent Advances in Common Diseases of Children" at the New York Academy of Medicine at 4 30 on January 21

DR HOWARD C TAYLOR, JR, Associate Professor of Gynecology and Obstetrics at the New York University Medical School, will lecture on "Endocrine Therapy in Gynecology" at the New York Academy of Medicine at 4 30 on January 28

DR JAMES J WALSH, Extension Professor, Fordham University, will speak on "Medicine in the Middle Ages" at the New York Academy of Medicine on Jan 27 at 8 15 P M

DR JAMES RALPH SCOTT will lecture on "Insulin and Protamine Insulin" at the New York Academy of Medicine on Feb 3 at 4 P M

Niagara County

DR D VINCENT LEONE, of Niagara Falls, was chosen president of the Niagara County Medical Society at the annual meeting on Dec. 14

Other officers elected were

Hospital News

Golden Age of New York City Public Hospitals

No city in the world, probably, has ever known such an era of municipal hospital building as the city of New York is experiencing at the present time A wizard at figures could amaze us by telling how high the money being spent would stack up if piled in columns of coins that we all know would never stand up that way, or how many miles would be carpeted by it in dollar bills when we know that our eager and alert populace would see it as a "wishing carpet," and realize on it as fast as it was laid

However, a mere glimpse of the letter sent by Hospital Commissioner Goldwater to Mr Kenneth Dayton, Director of the Budget, on December 7, is enough to fire the imagination. The Commissioner is asking for some money (or *some* money) to spend in nine months, from April 1 to December 31, and it foots up to the tidy sum of over $60,000,000 He admits himself that it is a "rather formidable list." He arranges it thus

Out Patient Department Projects	$3,250,000
Urgent Relief and Expansion Projects	5,620,000
Relief and Expansion Projects	348,527
Renovations	808,000
New Buildings, other than Out Patient Buildings	33,950,000
Projects authorized in 1937 Capital Outlay Budget for which partial appropriations only have been made—Appropriations needed to complete—For construction	13,002,000
For furnishings	1,721,000
Projects authorized prior to April 1, 1937—Appropriations needed to complete—For construction	894,100
For furnishings	1,258,000

Of course the reasons for the city's huge hospital expansion have all been gone over before, and approved, so Dr Goldwater merely reiterates

"Once more let me say that 'the program submitted reflects a serious desire on the part of the Department to substitute safe for unsafe buildings, to escape from the annoyances of obsolescence which has progressed almost to the point of dilapidation, to follow the needs of shifting and growing populations, to recognize by appropriate action a growing tendency on the part of the masses to rely on municipal hospitals for services which are beyond their economic reach, to the adoption of reasonable standards of dispensary care which are accepted as normal by voluntary institutions, to advance into the neglected field of venereal disease, and in general, to provide suitable and adequate institutional medical service for the dependent and semi-dependent sick'"

Those interested may like to see how the millions are allotted to various projects This table tells

New Projects of Major Importance Included in the Capital Outlay Budget

Department of Hospitals—1938

OUT-PATIENT DEPARTMENTS	
Coney Island Hospital	$400,000
Cumberland Hospital	400,000
Lincoln Hospital	400,000
Bellevue Hospital	100,000
Harlem Hospital	750,000
Queens General Hospital	300,000
Kings County Hospital	750,000
Morrisania Hospital	150,000
GENERAL HOSPITALS	
New General Hospital for Queens (600 beds)	$4,500,000
New General Hospital for Brownsville-East New York Section of Brooklyn (600 beds)	4,500,000
Coney Island Hospital, addition (200 beds)	1,000,000
Cumberland Hospital, Brooklyn, addition (200 beds), Nurses' Home, Staff House, Laundry and Power Plant	2 875,000
SPECIAL HOSPITALS	
Bronx Hospital (500 beds), for tuberculosis patients, with wing for contagious diseases	4,000,000
Neponsit Beach Hospital, tuberculosis addition, 200 patients	1,200,000
Kings County Hospital, Centre for tuberculosis patients (500 beds)	3,000,000
New Cancer Hospital, Welfare Island (450 beds)	2,400,000
Brooklyn Hospital for Venereal diseases (500 beds)	2,500,000
Municipal Sanatorium, Otisville, N Y (400 beds), to replace old buildings and shacks	2,250,000
Sea View Hospital, to replace shacks (350 beds)	1,400,000

merce will aid the Queensboro Tuberculosis and Health Association in the fight against tuberculosis by urging industry to make use of the association's rapid x-ray process in diagnosing the disease, according to an announcement by Dr H. P Mencken, chairman of the chamber's public health committee

"The association," Dr Mencken said, "is doing splendid work in Queens, particularly among youths of school age As yet, however, not a great deal has been done in industry We feel that the chamber can be of great assistance in that respect."

Rensselaer County

The following officers of the Medical Society of the County of Rensselaer were elected December 14

Officers

President	Hugh V Foley, Troy
Vice-President	William T Shields, Jr, Troy
Secretary	Leo S Weinstein, Troy
Treasurer	John F Russell, Troy

Censors

William Trotter — Chas W Hamm

Delegates

Stephen H Curtis — John D Carroll

Alternate Delegates

George E. Smith — Clement J Handron

—Reported by Leo S Weinstein, M D, Secretary

Dr. Charles H Goodrich, president of the New York State Medical Society, and Dr Howard F Root of Deaconess Hospital, Boston, were the speakers at the annual dinner meeting of the Rensselaer County Medical Society on Dec 15 in the Crystal Ballroom of The Hendrick Hudson at Troy

Dr Root spoke on "Endocrinology," and Dr Goodrich on "Preventive Medicine"

Dr. Leo Frank Adt, eye specialist formerly on the staff of the Troy Hospital, died Dec 3 in Albany after a ten-day illness from pneumonia He was seventy-one and had practiced in the Troy area for fifty years, having also served on the staffs of the Albany Hospital and St Peter's Hospital in Albany

Richmond County

Dr. Frederick M Schwerd, chief surgeon of Richmond Memorial Hospital, Dreyfus Foundation, was unanimously elected president of the Richmond County Medical Society at the Staten Island Club, St George, on Dec. 8

Also elected were

Officers

Vice-President	Herbert Cochrane, New Brighton
Secretary	John K. Lucey, Stapleton
Treasurer	Curtis J Becker, New Brighton

Delegates to the State Convention

Arthur S Driscoll — Stanley C. Pettit

Alternate Delegates

Elseth Marcus — Erna Enderle

Ulster County

Dr Eugene F Galvin, of Rosendale, was elected president of the Medical Society of the County of Ulster at the annual meeting in Kingston on Dec 15

Besides Dr Galvin, other officers named for the coming year are

Officers

Vice President	Harold Rakov, Kingston
Treasurer	B Van Gaasbeek, Kingston
Secretary	C L. Gannon, Kingston

Censors

J F Larkin — F H Voss
John B Krom — Saul Ritchie
Virgil DeWitt

Delegate to the State Society Convention

F W Holcomb

Alternate Delegate

C L. Gannon

Delegate to the Third District Branch Meeting

Frank Holcomb

Alternate Delegate

K. H LeFevre

Dr F H Voss, retiring president, urged compensation for doctors attending hospitalized relief cases The movement for compensation for doctors where relief clients are hospitalized was also reported by Dr L E Sanford, chairman of the Public Health and Public Relations committee, who pointed out that hospital expenses are paid by the towns or cities in these cases but doctors are asked to give their services

Westchester County

Elmon L Vernier, public school director of health and physical education delivered a paper on the relationship of physicians to the school physical education program, to the New Rochelle Medical Society, on Dec 13 at New Rochelle Hospital

Dr Charles Ogilvy, physician, voluntarily assisting the school system physical corrective program, also spoke

Stress was placed on the student sickness or physical activity "excuses," by Mr Vernier It is hoped to devise a standardized "physical recommendation" report on students for all physicians

Sea View Hospital, to replace shacks (350 beds)	1,400,000

MISCELLANEOUS ITEMS

Bellevue Hospital, New Nurses' Home and Central School for Nurses	2,500,000
Kings County Hospital, Laboratory and Morgue	300,000
Home for Dependents, Welfare Island (600 beds), to replace old buildings	1,500,000

Preliminary blueprints of the proposed Triborough Tuberculosis Hospital to be constructed at Parsons boulevard, between Eighty-second drive and Goethals avenue, Flushing-Hillcrest, have been approved by the Municipal Art Commission

Uncertainty still exists regarding the type of coloring to be used on exterior work, reported Dr Everett Peterson, assistant secretary, but a mere outline serves to indicate the scope of the planning

The institution will have a bed capacity of 531, with room for ninety-two patients on typical floors from the third to the seventh inclusive The second floor will have rooms for fluoroscopy, radiography and metabolism work, while on the eighth floor will be space for a pneumothorax laboratory, solarium and roofs

Incidental renovations to the Queens General Hospital outlined under the same appropriation will cover enlargements of the mortuary building and extension of the laundry

Improvements

THE ELI WHITE MEMORIAL Building, a new $1,500,000 structure for the nurses of St Luke's Hospital, in New York City was opened formally on Dec 16 With nurses as guides, several hundred guests inspected the fourteen-story building that extends from Amsterdam Avenue and West 114th Street to West 115th Street.

Built to house some 300 nurses, the building is equipped with a waiting and smoking room for men visitors and a kitchenette-breakfast room on each of the bedroom floors

The first floor includes lobbies, reception rooms and the auditorium, the second, the dining room and the third floor the classrooms and laboratories Living quarters are provided in the fourth to the tenth floors The upper floors are devoted to a sick bay and recreation rooms

MANY ALTERATIONS ARE PLANNED at the Oneida County Hospital, Dr Robert L Bartlett, superintendent, revealed in his annual report submitted to the Board of Managers in December

Principal among these is the changing of Davies Pavilion, used for many years as a contagious hospital, into quarters for male employes Rooms will be provided for twelve men on the second floor and the first floor will be converted into apartments for the medical staff

This building was constructed twenty-six years ago for administration offices It will be necessary to remove a wide front stairway and provide additional bath and lavatory facilities

Ward A will be converted into a contagious pavilion, there being six rooms available for various types of contagious diseases and a separate entrance on the west side of the building will be constructed The maternity section will occupy the space formerly used for office purposes and an adjoining small ward will be used for children

RENOVATION OF THE DIET laboratory at United Hospital, Portchester, formerly used by the student nurses, into a large, modern emergency room, will be completed about the middle of January

The cost is estimated at $2,500 The funds will be supplied by the Second Twig It was through the generosity of this group that more adequate quarters for the interns were established this year on the top floor of the main building

The present emergency room will be transformed into a lounge for attending physicians That change will leave the present doctors' room to be used as a much needed waiting room for the x-ray department.

Because of the increase in deep therapy treatments, changes in that department will also have to be made in the near future, according to Superintendent Wright Either an additional unit must be installed or one of the existing units will have to be replaced with one capable of much greater speed Lack of adequate space is the main obstacle to the first proposal

The radiographic equipment is also in

need of renovation Expenditure of at least $20,000 will be required in the next year in order to maintain the x-ray department on a higher plane, Mr Wright said

ADDRESSING THE HERKIMER COUNTY Board of Supervisors on December 10, Supervisor Daniel F Strobel resumed his advocacy of the erection of a hospital at the Herkimer County Home, contending that in forty years the county would save a million and a half dollars

Mr Strobel said figures show the county is paying $115 more per day for hospitalization of welfare patients than if it had its own hospital

Mr Strobel said he did not know how much a hospital at the County Home would cost. It might be $70,000 Even then, he stated, the county would save enough in two years to pay for the hospital and after the two years the savings would pile up

• • •

BROOKLYN WOMEN ARE rallying to the support of the campaign for the Swedish Hospital of that borough and, through social functions scheduled for the Winter season, anticipate raising a large part of the $250,000 needed to modernize the recently acquired six-story apartment building on Bedford Avenue Justice William F Hagarty of the Appellate Division of the Supreme Court is chairman of the current campaign

Events

MORE THAN 1,000 PERSONS attended the fifteenth anniversary dinner of Israel Zion Hospital on December 12, at the Hotel St. George, Brooklyn, paying $100 a couple to help defray the cost of the eight-story addition which the hospital is building at Forty-ninth Street and Tenth Avenue, Brooklyn

Speakers included Fred Kronish, president of the Bensonhurst National Bank, chairman of the dinner committee, and Morris A Goodman, president of the hospital Governor Herbert H Lehman sent a message congratulating the hospital on its work

At a meeting of the hospital's trustees earlier in the day, Boris Fingerhood, superintendent, stressed the importance of completing the addition as soon as possible He said that the hospital's present average bed occupancy was eighty-seven per cent—among the highest of any institution in the state.

The addition, expected to be ready for occupancy early this year, will make Israel Zion Hospital the second largest Jewish institution of its kind in the country The addition will increase the hospital's present capacity of 450 beds by 220 The hospital occupies both sides of the Tenth Avenue block from Forty-eighth to Forty-ninth Streets, Brooklyn

THE METHODIST EPISCOPAL HOSPITAL of Brooklyn celebrated fifty years of service with a dinner for the board of managers in the administration building on December 15 Five of the first patients were present.

The institution, known as "Mother of Methodist Hospitals," was dedicated on Dec. 15, 1887, at a time when there were six other hospitals in the old City of Brooklyn Originally the patients were tended by thirteen physicians, three interns and ten nurses Today there are 106 staff physicians, four resident doctors, fourteen interns, 200 graduate and student nurses and 100 more on call

THE NURSES' ALUMNAE ASSOCIATION of the Amsterdam City Hospital will hold a dance on Feb 11

AN ENTERTAINMENT of unusual interest both to children and their elders was arranged for the Christmas season as a benefit for the New York Orthopedic Dispensary and Hospital On the afternoon of December 30 Debussy's children's ballet, "La Boite a Joujoux," was presented by a cast of talented children in the grand ballroom of the Waldorf-Astoria. The ballet was staged and directed by Annette Van Dyke and the musical accompaniment was provided by George Barrere and the Barrere Little Symphony Orchestra The children comprising the cast were assembled through the cooperation and interest of leading dancing teachers in the city

LORENZ J BROSNAN, ESQ
Counsel, Medical Society of the State of New York

Incorrect Diagnosis as Malpractice

A case recently decided in one of the Western States is an excellent example of the manner in which a malpractice action against a physician can fail to succeed where error in diagnosis, and subsequent suffering is shown *

The case was one which arose from a hip injury sustained by one M a married man, when he fell from a ladder Dr R was shortly called to see him, and found him already in bed. Upon examination he gave it as his opinion that M was suffering from torn ligaments and strained muscles His advice to the patient was rest and quiet in bed. No x-rays were ordered by Dr R

The patient did in fact remain in bed for a little over a month during which time he did not request Dr R to call to attend him following the one visit, nor did any other physician care for him during this period. However, as a sort of substitute for calling Dr R to actually attend the patient, M's wife visited Dr R.'s office on several occasions during that time, and sought his advice She was told by the doctor to allow her husband to remain in bed, and to let nature take its course in bringing about recovery On one of such visits by the wife, Dr R directed her to rub and massage the affected area. During all of this time the patient suffered considerable pain

Finally, another physician was called to attend the patient, a Dr B, who specialized in bone and joint surgery He immediately had an x-ray picture taken, which showed an impacted fracture of the hip He performed an open operation and the patient's recovery after the operation was satisfactory

At this point M instituted a malpractice action against Dr R. charging him with negligent and unskillful treatment, which he claimed caused him extensive injuries Upon the trial of the case the principal witness of the plaintiff was Dr B who qualified and testified as an expert. In the course of his testimony he stated that there are probably about twenty-five methods of treating a dislocated or broken hip He described as one method, a usual method and one quite commonly resorted to, that of merely allowing the patient to rest quietly in bed, to permit the bones to knit of their own accord by nature's healing processes It was conceded that the defendant's diagnosis was wrong, but that such treatment was in substance what Dr R prescribed Dr B further testified that the operation which he had performed was the unusual rather than the usual form of treatment, and that the method he had used was resorted to to accelerate the healing time, when the patient wants to get back to work more quickly than the average case. The specialist also gave as his opinion that it was not unusual for patients with fractured hips to remain in bed for up to nine months, and that operations such as the one he had performed could be readily performed a year after the accident

Upon such evidence the trial court granted defendant's application for a dismissal of the action thereby ruling that no cause of action had been made out for submission to the jury The plaintiff took an appeal to the highest court of the state from the judgment in favor of Dr R.

The Appellate Court affirmed the ruling appealed from and in the course of the opinion of affirmance said

> It appears that the negligence upon which plaintiff's case rested consisted of the failure to properly diagnose the case which included the failure to immediately x-ray the injury We do not hold that such could not constitute negligence, in a proper case, but we do hold that it does not constitute actionable negligence unless it is shown that plaintiff was injured in some manner by such erroneous diagnosis There is no such evidence here. Admitting, for the sake of reasoning, that the diagnosis was incorrect, or even that it was negligently incorrect, the evidence reveals that nevertheless the defendant prescribed a treatment, which was proper under the circumstances and entirely fitting to that true condition of plaintiff which a correct diagnosis would have revealed. There is no evidence in this record that proper care would have required a different method of treatment if the correct diagnosis had been made in the beginning
>
> It is true that there is abundant evidence of plaintiff's suffering, but it is not shown to have resulted from the treatment instead of the injury, nor is there any evidence that under some other form of treatment the suffering would have been alleviated or that the operation should have been performed sooner
>
> We do not overlook the fact that the de-

* McBridge v Roy 58 Pac. (2) 886

Newsy Notes

A City of the Sick

FOURTEEN GALLONS of tincture of iodine, 48,000 aspirin tablets, 380 eight-ounce cans of ether, 875 one-dose ampoules of salvarsan a month, more than 400 x-ray pictures a day, from thirty to thirty-five operations, about twenty of them major ones, 5,000 or more visitors on a visiting day, 2,000 pounds of bread, 3,630 quarts of milk, 360 dozen eggs and 450 pounds of butter for 10,000 meals a day

These are random statistics given in the New York *Sun* to afford an idea of the supplies used and services rendered by only one of the hospitals here, which have a total population surpassing that of many a flourishing town in the United States On a full day there may be close to 50,000 persons in hospital beds within the city of New York.

It is Kings County Hospital, set in thirteen acres of ground fronting on Clarkson avenue in Brooklyn, which uses the fourteen gallons of iodine every month, and "The County," as it is familiarly called, is the largest hospital in the city, and has been since the opening of three new main buildings in 1932 Bellevue had been larger before that.

The basis for thus reckoning size is bed capacity, and this is a figure which fluctuates as additions are made, or old buildings razed to make way for new On one recent day, the County reported 2,825 beds as against 2,431 at Bellevue, but soon 750 more will be added to the Brooklyn figure. The old main building, part of it dating back to 1831, is coming down, and a 750-bed hospital for sufferers from chronic diseases will replace it.

A FIELD TEST in December, in which 110 young women from four Brooklyn hospitals participated, completed their course at the Brooklyn Botanic Garden In the field test the students were required to recognize and name at sight any of the fifty or more medicinal plants they had been studying at the Garden

Such plants as the licorice, glycyrrhiza glabra, the wild cherry, prunus serotina, peppermint, mentha piperita, wintergreen, gaultheria procumbens, ephedra, ephedra distachya, juniper, juniperus communis, olive, olea europaea, eucalyptus, coffee, aloes, and others growing in the plantations and conservatories of the garden are included in this list.

FIVE HOSPITALS HAVE BEEN ADDED to the group participating in the 3-cent-a-day-plan for hospital care in the Capital District, at Albany

E. R Evans, executive director of the Associated Hospital Service, announced that Mary McClellan Hospital at Cambridge, Saratoga Hospital, Nathan Littauer Hospital at Gloversville, Glens Falls Hospital, and St. Mary's Hospital at Amsterdam have joined the original ten hospitals in the plan Fourteen new groups of employed persons have joined the plan, Mr Evans said. More than 9,000 are enrolled

At the Helm

THE FOLLOWING HOSPITAL OFFICIALS HAVE BEEN CHOSEN

Dr Max M Simon, to be chief of staff of St Francis Hospital at Poughkeepsie

Mrs Richmond F Meyer, to be president of the Vassar Brothers Hospital Association at Poughkeepsie

Dr Henry J Vier, to be chief of staff of St. Agnes Hospital at White Plains

Miss Isabel T Goss, to be president of the Mercy Hospital Guild at Auburn

Dr John E Daugherty, superintendent of the Jamaica Hospital, Jamaica, Queens, died in that hospital on Dec. 13 after collapsing of a paralytic stroke while addressing a regional conference of Lions Club officers in the Hotel Franklin, Jamaica. He was sixty-one years old Dr Daugherty was vice president of the club In the World War, Dr Daugherty, with the rank of lieutenant colonel, had charge of Base Hospital 97, in France, and later organized hospitals at Kelly Field, Texas, and Camp Dodge, Iowa. From 1920 to 1930 he was executive director of the Jewish Hospital in Brooklyn In September, 1933, he succeeded Dr Hayward Cleveland as medical superintendent of the Jamaica Hospital

Across the Desk

Babies via the Grist Mill

BRITISH DOCTORS HAVE BEEN discussing the relation between brown bread (retaining the wheat-germ) and human fertility, and it has reached a point where some physicians are asking that the Ministry of Health, the Medical Research Council, or some other authoritative body issue a precise statement telling how brown bread can be made in such a way that the vitamins are not removed

While awaiting such a statement, an English physician tells in the *British Medical Journal* of some interesting results of "rough and ready methods we have used here for some years past" He is Dr Lionel James Picton, of Holmes Chapel, and the first case he describes was "a lady with one little girl miscarried in her second pregnancy and a rather prolonged sterile interval followed" Anxious for a male baby, she sought advice

Dr Picton thought of wheat-germ oil, sometimes used, then, it was suggested, why not the germ itself? So he approached a firm of millers, who were at once interested, and "we received it 24 hours after the rollers had stripped it from the grain" It was mixed with whole meal and yeast, and the bread was baked "Well, the baby arrived in due course (by luck a boy), and when, after a further prolonged sterile interval, the bread was resumed, in 15 to 20 weeks pregnancy was again reported "The product has become so popular in that district that it is known as "fertility bread" The essential condition, we are told, "is that the baking shall at once follow the grinding" Dr Picton's letter, too long to quote here, is in *The British Medical Journal* of Nov 6, p 938, and is well worth reading Among other things he gives an apetizing recipe for "wheaten cakes" made of the fertility flour Patients who cannot get fresh-ground whole wheat meal can buy a small home grinder, or use an old coffee-grinder

America to Blame

Of course America is to blame "The introduction of the steel roller mill from America in 1872 was the beginning of the end" "Think of it!" he exclaims "The first operation of that mill strips the grain of its coat and shirt (bran and aleurone layers) and of its purse of money (the embryo and germ) and leaves the poor white body naked. White flour results without a single + sign to its name in the vitamin schedule What wonder that we spend millions on patent aperients!" Since that date appendicitis began to take its rise, and the birth-rate began to fall—"here is a factor which, though subtle, may well be fundamental"

Population enthusiasts who wish to work up a sentiment for a higher birth-rate may find inspiration here for a new hymn—"In this wheat by and by"

Zeus Calls Lady Nicotine to Task

EVERYBODY SEEMS TO ADMIT that the smoke of the tobacco leaf has undesirable things in it, but the consumption of tobacco rises higher and higher every year Lady Nicotine, like some others of her sex, is talked about a lot, but the men find her fascinating for all that What to do? A scientific article in these pages a couple of years ago (Nov 15, 1935) by Herman Sharlit, M D, of New York City, mentioned among the constituents of tobacco smoke such things as "carbon monoxide, ammonia, prussic acid, acetic acid, aldehydes including acrolein, the alkaloid nicotine and pyrrol, pyridine and other heterocyclic nitrogenous bases (generally grouped under the term 'tars')"

Dr Sharlit has been interested in tobacco smoke chemistry about a dozen years, and after canvassing various efforts to render smoking harmless, he concludes that "there remains a simpler yet perfect approach to a solution—filtration of the smoke." He summed up his views in this paragraph

"The medical profession, if it is to con-

fendant prescribed rubbing and massaging, in addition to the rest and quiet. There is no evidence that this was improper For all we know, from the face of the record, it may have been one of those "probably twenty-five different ways by various men who have their own particular way of doing things," as testified by the plaintiff's expert. There was no evidence that any of those ways are wrong If we should hold as a matter of judicial knowledge that rubbing and massage are opposed to rest and quiet, the fact remains that although rest and quiet are one of the recognized treatments, rubbing and massage were not shown to have been unrecognized or improper

Plaintiff complains bitterly of the hardship of proof in malpractice cases This is a situation which if true, we are powerless to remedy Basically, there is little, if any, difference, between the rules of negligence as applied in malpractice cases and as applied to other cases In any kind of negligence case, the burden is upon the plaintiff to establish his injury, and that the injury resulted from the negligence of the defendant in failing to observe the particular degree of care required in the premises The degree of care required of a physician or surgeon in the treatment of his patient is that degree of care which is ordinary under the circumstances of the particular case. He is not an insurer, nor affords any guaranty of cure unless it is so represented by him For the reason that the course he should pursue, in many cases, and in the light of foresight, is purely a matter of opinion in which some of his professional brethern will agree and some disagree, he is not held responsible for an error in judgment unless that error is so great as to constitute negligence Negligence may consist of an error in judgment, or cause it, or grow from it, but an error in judgment is not necessarily negligence

But however all of that may be, the plaintiff in the instant case failed to offer any evidence tending to prove that any of his suffering was attributable to any act or omission of the defendant. On the contrary, he made it affirmatively appear that the treatment rendered was in the exercise of due care according to medical practice and experience. The custom and usage are not necessarily determinative of whether proper care was used, but they help considerably on the question in any event, and by whatever method of proof it should have been attempted the burden of proof was upon the plaintiff to establish the alleged negligence and his resultant injury, failing in which, it was the duty of the trial court to sustain the demurrer

Injury Following Intravenous Injection

A physician who specialized in surgery was called to the home of a woman thirty years of age where he found her in bed complaining of abdominal pains He examined her and diagnosed her condition as acute appendicitis Immediately, the doctor sent her to a hospital where the same day under general anesthesia he performed a routine operation for the correction of what proved to be a condition of acute gangrenous appendicitis The wound was closed without drains and the patient was returned to her room Shortly thereafter the surgeon decided that the patient needed intravenous injections of glucose and saline solution. He directed one of the resident physicians on the staff of the hospital to administer to her such solution Sometime later he observed her in her room and found that his orders had been carried out and that the patient's left arm was strapped to a board and in extension and that the needle apparently was properly set and the solution flowing The needle in connection with the administration of the intravenous solution remained in position for a number of hours. When the surgeon next saw the patient the following day, she complained of pain in the arm and examination showed moderate swelling at the site where the resident physician had inserted the needle It was found that the patient had difficulty in moving the thumb of her left hand The patient remained in the hospital for nine days and during that time the surgeon supervised her general treatment which included the application of dressings to her arm At the time of her discharge, the swelling which had been near the region of the left elbow joint had gone down but the patient still had inability to internally rotate her left thumb The doctor never saw the patient thereafter

Sometime later a malpractice action was instituted against the surgeon by the plaintiff in which the charge was made that the defendant had negligently conducted himself in the care of the case particularly with reference to the administration of the intravenous injection so as to cause a permanent paralysis affecting the entire left arm, hand and fingers A physical examination of the plaintiff was made prior to the trial and it appeared that the patient complained of numbness in her fingers and thumb and lack of the full use of the same The opinion of the examining physician was that the plaintiff would eventually have a complete recovery and regain full use of her arm and fingers He did, however, conclude that the condition was neuritis of the left median nerve probably due to pressure and ischemia affecting the left median nerve

The case came on for trial before a Court without a jury and at the conclusion of all the testimony the Court directed a verdict in favor of the defendant physician thereby holding that the plaintiff had failed to establish a cause of action against the defendant and exonerated him of all charges of malpractice

EXTREME ACCU

in Prescription Labeling

When a Liggett registered pharmacist compounds your prescription, your mind can be completely at rest Not only is the prescription compounded with extreme care, but it is checked and double checked before it is given to your patient The labeling is done with extreme accuracy For your own protection, and the protection of your patients, urge them to have their prescriptions compounded at a Liggett Drug Store

Liggett's

THE REXALL DRUG STORES

cern itself in the matter at all, should take the following position regarding cigarettes Tobacco smoke cannot be considered harmless The manufacturers of tobacco products are to be encouraged in their efforts to modify the art in behalf of a more harmless smoke, but, however good the achievement, the introduction of a filtering material into the smoke stream will effect a still safer smoke The profession should assist in the production of a consumers' psychology sympathetic to the introduction of filters into cigarettes"

"Hair of the Dog Cures the Bite"

What brings the subject up at this time is the appearance of a cigarette filter-holder that seems built on the underlying principle of the homeopathic school of medicine, "like cures like" Before the days of homeopathy this thought was expressed in more vulgar patois—"the hair of the dog will cure the bite" Our science of sera and viruses is also founded, in a way, on the idea that like cures like, and when the proposition comes along to filter, or cure, one cigarette with another cigarette, it is worth notice Here the bespectacled Ph D's have been working in the laboratories for years to find some very, very scientific substance to filter the nicotine, tar, and other fearsome and unpleasant elements out of cigarette smoke, and all the time every one of them had in his pocket the very thing for it—a cigarette

Here, too, maybe, is the reason why those deadly drops of nicotine in the cigars and cigarettes have not keeled us all over and strewn the streets with handsome corpses Perhaps every cigar and cigarette has acted as its own filter, and some of the nicotine, etc, of the first half has been intercepted by the last half, so that when it is pretty well burnt down the accumulation begins to taste strong and it is tossed away That idea has often been advanced The new filter is simply a holder made of specially prepared aluminum with a scientifically designed bit The aluminum tubing is long enough to take an ordinary cigarette, and with a space inside to hold another cigarette through which the smoke must pass The aluminum is said to be an especially efficient conductor of heat, cooling the smoke and causing the hot vapors to condense and deposit the undesirable elements in the second cigarette

For some reason the device is called "Zeus" Just why is not revealed Zeus of course, was the ruler of the gods and goddesses and a very capable fellow in many ways, so he probably would be equal to the task here

The old, carefree ways of the gods on Mount Olympus are no more, and it appears that Zeus was put to long, severe tests in a research lab, to see what he could do Large, impressive tables of figures tell all about it, but in a nutshell, or on the point of a brasstack, as it were, Zeus absorbs up to seventy to ninety per cent of the nicotine and tars of the cigarettes he filters

---

THE DOCTOR'S SOUL

That a doctor's soul is as important for his success in medicine as are his mental attainments, was the reminder given medical students by Dr Henry Asbury Christian, professor of the theory and practice of physics at Harvard University Medical School, speaking at the dedication of Syracuse University's new College of Medicine building on Nov 22

Taking as his topic "The Fruition of the Clinician," Dr Christian addressed himself directly to the medical students present at the dedication and blazed for them the path to success as clinicians He interpreted the work of a clinician, by implication, as concerning the investigation of disease in a living subject rather than in controlled experiment.

Speaking first of the young medical student's technical training, Dr Christian then declared

"Do not gather from what I have said that medicine and its practice is all a matter of mind. Much, too, of its success lies in the soul The medical man should be an exemplar in his community of the worthy life. His dealings all must be upright and honest, his habits free from criticism

"He will need the support of a true religion A simple faith in God and His ways should emanate from all true physicians If he believes not, this will be impossible The believing physician often can bring into perfection a cure not otherwise attainable There is no place in the profession of medicine for the agnostic, the atheist."

Unlike Other Shaving Devices

PACKARD LEKTRO-SHAVER

is MORE than a modified hair-clipper

IT SHEARS!

● Only Packard Lektro-Shaver shears instead of clips—with the smooth, round head. Let's see about *shearing* first Other shavers *break* off the beard by forcing an upper plate across each whisker as it is held momentarily rigid against a stationary lower plate But Packard shaves with a *shearing* stroke. Its head is shaped like a round comb Your whiskers spring up between the teeth Then a patented shearing element moves diagonally across them in a *twisting* motion and shears them away with a sliding stroke—the kind a master barber would use *..15,000 times a minute.*

. . . and it has a Smooth, Round Head

That exclusive round head is important too—for what is smoother than round? It eliminates the sharp edges found on other electric shavers It gives a skin-close shave every time—safely—sailing right over facial blemishes without harm—yet never missing a hair And you need not hold the Packard at any special, precise shaving angle to get results. So finely calibrated is its entire business end that the lightest touch does the job Get a Packard Lektro-Shaver for yourself *today*

PROVED DEFINITELY LESS IRRITATING...

Cigarettes made by the ordinary method of manufacture produce an irritation of the nose and throat that is noticeably absent when smoking Philip Morris.

Scientific research* shows that cigarettes in which diethylene glycol is used, are definitely less irritating—a major improvement in cigarettes.

In Philip Morris diethylene glycol is used exclusively as the hygroscopic agent.

THE DRINK THAT FEEDS NURSING MOTHERS AND PREGNANT WOMEN

The special food aid which Cocomalt brings during lactation and pregnancy has found favor with physicians everywhere Precision manufacture and purity-sealed cans insure that a measured amount of Calcium, Phosphorus, Vitamin D, Iron and other food essentials is delivered in each ounce-serving of Cocomalt

Thus, since each ounce-serving of Cocomalt has been *fortified* with 15 gram of Calcium, 16 gram of Phosphorus, an 8-oz glass of Cocomalt and milk actually provides 39 gram of Calcium, 33 gram of Phosphorus And, helping insure that the system can utilize these food-minerals, each ounce of Cocomalt also contains 134 U S P Units of Vitamin D, derived from natural oils and biologically tested for potency

	1 Ounce of Cocomalt adds	1 Glass of Milk (8 Liquid Ozs.) contains	Thus, 1 Glass of Cocomalt and milk contains
†IRON	0 005 GRAM	*TRACE	0.005 GRAM
†VITAMIN D	134 U S.P UNITS	*SMALL AMOUNT; VARIABLE	134 U S.P UNITS
†CALCIUM	0 15 GRAM	0.24 GRAM	0.39 GRAM

INSTITUTIONS SPECIALIZING IN TREATMENTS

The Dietary Importance

The important part played by food in restoring vitality, so essential to recovery, is emphasized by the Brunswick Home, Amityville, L I

Every physician knows that proper diet in nervous disorders is a prescribed ritual in the established therapy for such cases whether the age is six or sixty As diabetics and special diet cases are also cared for at this institution, its facilities are unusually adequate for treating patients requiring more than ordinary attention in feeding

An example of the ends to which the Brunswick Home has gone in providing requisite diets is illustrated in the fact that each building has its own dining room, kitchen and serving pantry All food is prepared and served under the direction of a graduate dietitian and her assistants All orders for special diets, prescribed by the patient's own physician, are carefully followed, and individual tray service to rooms, when desired or necessary, carries no additional charge.

The facilities of kitchens and dining rooms are sufficient for feeding five hundred persons without impairing the individual dietary attention In addition to the skilled dietitians for preparing menus of a variety of dishes served in an attractive form, only chefs who have mastered all branches of their art are employed at the Brunswick Home

But the care exercised in the provision of equipment and skill of the staff would be of little value if the food itself was not of finest quality To assure this, the Home maintains its own 52-acre farm upon which is grown all the seasonable vegetables used in the kitchens Great care is also evident in the selection of meats and other foods not supplied by the institution's own farm facilities, and a modern dairy nearby supplies day-fresh milk and cream

Perhaps much of the success enjoyed by the Brunswick Home in its fifty-one years as a specialized institution, can be credited to the importance placed on feeding its patients

1 teaspoon	15 cals
1 tablespoon	60 cals

The final test of the adequacy of a feeding is the response on the part of the infant It is frequently necessary to give a milk mixture of a considerably higher caloric value than anticipated

The giving of food of too low a caloric value to meet the infant's needs is usually the chief cause of failure in infant feeding The energy requirements may be met by Karo added to the type of formula indicated.

For further information, write
CORN PRODUCTS SALES COMPANY
Dept. NMI, 17 Battery Place, New York, N Y

★ Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively

KNOX CLINICAL NOTES

ONE OF A SERIES OF CORRESPONDENCE EXCHANGES WITH PHYSICIANS ABOUT KNOX GELATINE

The Glycine Content of KNOX GELATINE

A physician writes, "Pertaining to Glycine—glycocoll NH_2CH_2COOH—gelatine contains large amounts of Glycine I feed a great deal of Knox Gelatine to patients suffering from fatigability—'muscle exhaustion'—with very good results in conjunction with the administration of 15 to 30 grams of Glycine given daily Glycine is rather expensive to patients—about eight dollars per pound I wish to know the percentage of Glycine in your best grade Knox Gelatine so I may substitute more liberal feedings of Knox Gelatine and cut the pure Glycine dosage down to a lower and more economical level"

The KNOX GELATINE LABORATORY *Replied as Follows:*

Thank you, Doctor! You are right about Knox Gelatine Increasing amounts of it are being fed in asthenic conditions Knox Gelatine contains 25% of amino-acetic acid (Glycine) Goodly amounts can be fed in soups, broths, and other recipes to supply amounts of Glycine in this palatable gelatine form which is so economical Perhaps the simplest way to feed it is as follows have the patient dissolve the contents of one of the envelopes from the Knox Gelatine package in a little warm water and then fill the glass with cold fruit juice It is a palatable drink which gives the patient about seven grams of pure gelatine As many as 4 envelopes can be taken at one time, as often as needed during the day

Why you should insist on Knox Sparkling Gelatine

Because Knox Gelatine is 85% protein in an easily digestible form—because it contains absolutely no sugar or other substances to cause gas or fermentation, Knox Gelatine should not be confused with factory-flavored, sugar-laden dessert powders. Knox is 100% pure U S P. gelatine Knox Gelatine has been successfully used in the dietary of convalescents, anorexic, tubercular, diebetic, colitic, and aged patients

KNOX SPARKLING GELATINE

IS PURE GELATINE—NO SUGAR

Travel and Resorts

FLORIDA

Text of Mr R S Voigt's Radio Talk over Station WNEW, Dec 8, 1937

(*Moore*) Good Evening Ladies and Gentlemen I know of no better theme to describe the subject of tonight's talk than these lines "May Sunshine Light Your Way, and Time Mark Only Pleasant Memories" You guessed it . It's Florida A good place to visit and, as many find it, an equally good place to establish a home with palms, sunshine, and flowers to make life both pleasant and comfortable For those who have been there, Florida speaks for itself But for the benefit of those who have had merely to visualize it, I have invited as guest speaker for this evening, Mr R. S Voigt, General Eastern Passenger Agent, for the Atlantic Coast Line Railroad, who will tell us something about this lovely land Mr Voigt, why do you suppose almost everyone yearns at sometime or another to go to Florida?

R. S Voigt
General Eastern Passenger Agent of Atlantic Coast Line R. R

(*Voigt*) Well, Mr Moore, I would say because it offers so much to seekers after rest, relaxation and the thrill of outdoor life, as well as an escape from the rigors of winter ice and snow

(*Moore*) Yes, I'll grant that it has many advantages, but will you tell us what are some of those advantages?

(*Voigt*) Indeed, I'll be glad to First, it offers freedom from extremes of heat and cold which makes it a place where one can follow happily a more healthful and pleasant mode of living Its winter climate is the finest in the world with the Atlantic Ocean on the east and the Gulf of Mexico washing the western shores of this peninsular The days of sunshine are longer and the nights much shorter than in the north

(*Moore*) But why do you suppose each year more people go to Florida to establish either a winter or, in many cases, a permanent home?

(*Voigt*) I would say, largely because there you find in summer not only the same unusual winter environments, but also comfort in cooling sea breezes Of course, in the winter you also have absence of fuel bills in addition to wholesome outdoor diversions rather than costly indoor amusements Then, there's the abundance of locally grown fruits and vegetables, as well as other economies made possible by favorable natural conditions All of these tend to reduce the cost of living In other words, your dollar buys relatively more in year around comfort and enjoyment in Florida than elsewhere.

(*Moore*) Does it make much difference where you live in Florida?

(*Voigt*) Not a great deal It's suited to almost everybody Whether one chooses to live in hotel, apartment, boarding house, or rent or build a home it is sure to prove beneficial and delightful Even North Florida, you know, is south of Southern California.

(*Moore*) How about the children?

(*Voigt*) Florida is a real Paradise for boys and girls Between school hours, boating sailing picknicking hunts for strange seashells, flowers and birds all offer endless interest to the youngster Incidentally, most public schools in Florida offer free tuition to the children of winter visitors

(*Moore*) But to be more specific, if you were visiting Florida for the first time, where would you go to the east coast, the West Coast or to the central part of the State?

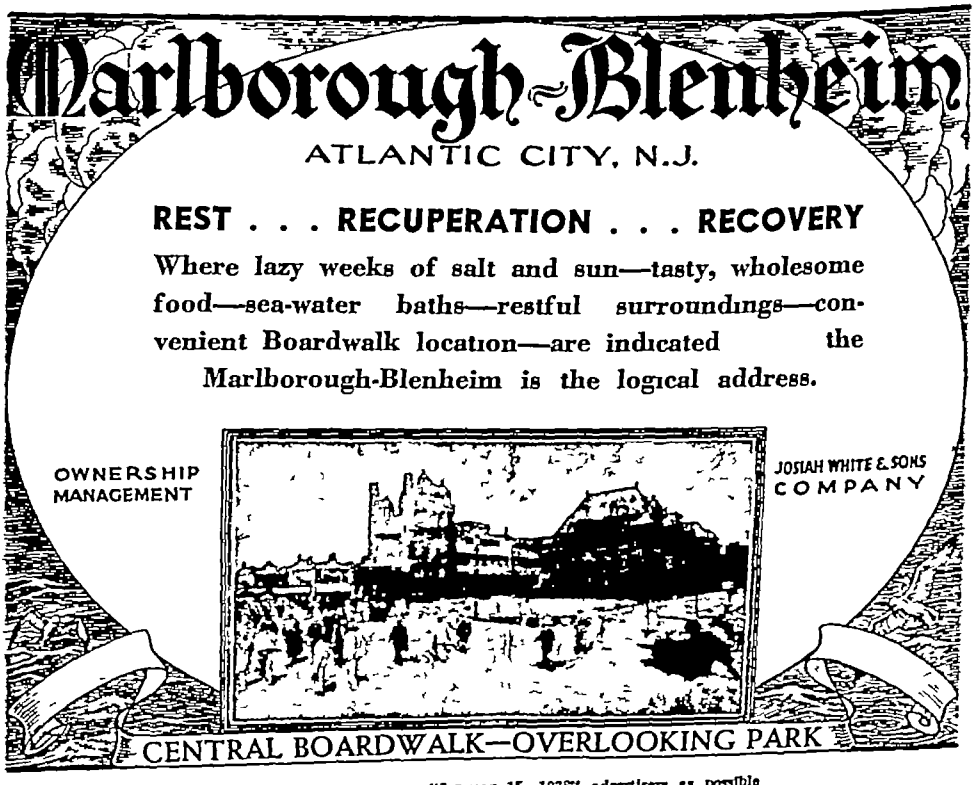
(*Voigt*) That's a moot question, Mr Moore. Of course, the entire State is attractive. It all depends The West Coast, adjacent to the always delightful Gulf of Mexico, has much to offer It is preferred by many who seek a less strenuous life and who spend the entire winter

at its resorts Then, too, Central Florida, while it does not offer ocean bathing, abounds in natural beauty, fascinating exotic flowers and places of historical interest On the East Coast, there is life and gayety at some of the world's outstanding resorts, especially at Palm Beach, Miami and Miami Beach

(*Moore*) You certainly paint an alluring picture, especially for those who have never visited Florida, but what about the famous places of interest there Will you mention a few?

(*Voigt*) Well there is Ravine Gardens at Palatka with its 250,000 rare tropical plants, shrubs and trees, including over 100,000 azaleas of every out-of-door variety found in the world

Cypress Gardens at Winter Haven are a marvel of natural and developed beauty Thousands of Gardenias grow wild there, as well as countless rare plants from the Far East and the South Sea Islands At Clearwater is an authentic Japanese Garden of unusual interest and beauty



But there are many other places, such as Rainbow Springs with its clear, hill-bordered basin of air-clear water, and glass-bottom boats for viewing colored fish and rich aquacultural life. Here, too, is found the only scenic waterfall in Florida Then, there is Silver Springs, one of the greatest natural wonders in the entire world Leesburg has lovely Venetian Gardens, landscaped islands, canals, etc. Near Sebring is Highland's Hammock with its 2,000 acres of primeval tropical beauty South of Vero Beach is McKee Jungle, another unworldly tropical beauty spot. The latest developed point of interest is Marine Land, on the ocean 16 miles south of St. Augustine, with its unique aquarium. Here deep-sea fish and animals may be viewed through port holes from an enclosed pavilion.

(*Moore*) And not forgetting, of course, St. Augustine itself

(*Voigt*) Certainly not. For it is one of the most interesting places in the entire South It is not only a quaint city, but famed as the oldest in the United States Its stories of past and Old World origin speak for themselves in the medieval, moat-surrounded castle of San Marcos Nearby stands the old city gateway, reminder of the time when St. Augustine was a walled town From the Plaza with its cathedral lead narrow streets with bits of old garden wall and an occasional overhanging balcony

(*Moore*) And then there's Daytona Beach

(*Voigt*) Yes, it occupies a wide area on the mainland and peninsular shores of the Halifax River Moss-hung oaks, magnolias and palmettos lend generous shade to wide residential streets Down the coast is Palm Beach Across from it, on the mainland, lies West Palm Beach Everything there conveys an impression of luxury, beauty and magnificence Not the

least of its charm is due to the profusion of graceful cocoanut palms from which it derives its name. Palatial homes and estates line its palm-shaded drives Yachts ride at anchor on Lake Worth, while to the East a jade-green surf breaks gently on its beaches

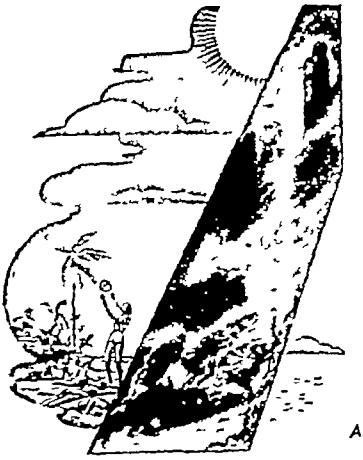
(*Moore*) What about Miami, Mr Voigt?

(*Voigt*) On the shores of Bay Biscayne, Miami and its suburbs are a Paradise of tropical vegetation, red-tiled roofs, many-hued stucco and stone buildings in architectural styles adapted from the Mediterranean Coasts Cocoanut and Royal Palms, exotic flowers and shrubs give the city an almost foreign aspect. Miami has an average winter temperature of 71 degrees

(*Moore*) What has Florida to offer in the way of sports and other diversions?

(*Voigt*) Florida has more than 3500 miles of sea coast and 35,000 inland lakes and tropical rivers, all thronged by sun-tanned people from every part of America. Its golf courses, palm-bordered and flower-scented, are always green and inviting They challenge your best game And, of course, Florida deep-sea and fresh-water fishing is unmatched anywhere. As a matter of fact, Florida never has dull moments for anyone, even to horse-racing fans, for at Hialeah and Tropical Park at Miami the silks of all the well-known stables flash past the finishing post to the roar of thousands of voices

(*Moore*) You have certainly created a Florida appetite with your descriptions Mr Voigt, but how do you ever handle all the traffic the travel demands?



(*Voigt*) True, it is no easy job, but our facilities are adequate for we have been developing them for a great many years For example, our Florida Special, known as the Aristocrat of Winter Trains, celebrates its 51st birthday on January 2nd next

(*Moore*) By the way, that is the train that is graced with a hostess, isn't it?

(*Voigt*) Yes, the equipment of each section of this train includes a specially designed full-length recreation car with a hostess presiding over its entertainment a decided novelty en route An Hawaiian Orchestra furnishes music and, of course, there is dancing and games In a word, one's holiday begins the moment he steps into this car

(*Moore*) That sounds intriguing But what are the social requirements of such a hostess?

(*Voigt*) For that information, I can best refer you to our Mrs Gertrude Kemp, Supervisor of Hostesses, who is with us in the studio and can best answer your question

(*Moore*) All right, Mrs Kemp, will you tell us what qualifications are required in a hostess on the Florida Special?

(*Mrs Kemp*) First, we seek those of pleasing address and personality, preferably of good family Age is not always important, although I would say that most of our hostesses are between 25 and 35 years of age. Naturally, they must have engaging manners and be activated by a desire, as well as possess the ability, to make the passengers' trip enjoyable

(*Moore*) How much of a staff have you?

(*Mrs Kemp*) So far, we have been successful in developing a staff of some 30 or 40 who measure up to our standard of requirements.

(*Moore*) That's interesting I suppose all of them are attractive?

(*Mrs Kemp*) Yes, indeed Come and see for yourself

(*Moore*) You've answered the question perfectly When may I go down?

(*Mrs Kemp*) Well, on January 2nd, the train's birthday, is the first trip of the season and we shall be delighted to have you with us

(*Moore*) Thank you, Mrs Kemp, for your information, and invitation Mr Voigt, one more question Of course, you have other facilities beyond the Florida Special?

(*Voigt*) Yes, indeed, we have a fine fleet of fast through daily trains eight from Chicago and the West and six from New York and the East.

(*Moore*) Do you recommend taking an automobile to Florida?

(*Voigt*) Yes, by all means But it's a ticklish job to drive all the way from the North because winter roads may be found covered with ice until well down in Dixie It's so much easier to ship your car, which can be done without red tape The cost is only 4c a mile, if two passengers go by train in Pullmans, or three passengers in coaches

We "Prescribe" . . . . WINTER SPORTS at

THE THAYER—WEST POINT

On the U. S. Military Reservation at West Point, N. Y.

Ski, Snowshoe Skate, enjoy the snow fun in the nearby hills and at Bear Mountain Park and come back to the warmth, good food, friendly service and colorful military atmosphere of this Treadway Inn.

A wonderful place for CONVENTIONS—exceptional facilities for groups of 100 to 400 Cocktail Grill.

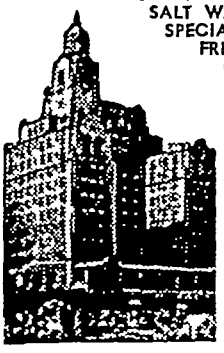
from Latin American countries

The Association is an international organization with chapters in this country and 21 other nations of the Western Hemisphere, established to promote interchange of medical knowledge and research and to improve friendly relations

Two scholarships will be given by the Association to Cuban medical students who have completed their internship They will be chosen by the faculty of the University of Havana The scholarships consist of 18 months resident internship in an American hospital where room and board will be provided free Each student is permitted to study any particular branch of medicine he desires The scholarships carry with them an allowance of $50 a month per student and transportation to and from home. The scholarships to be awarded were donated to the Association by Mrs Paul Moore, of Morristown, N J, and Dr William Sharpe, of New York.



Medical sessions and clinics will be held at all ports of call, as well as on shipboard. The greater part of the program, however, will be given during the five days spent in Havana.

The program is divided into 18 Sections

Great Western

AMERICAN WINES

When a patient requires a superior champagne during convalescence specify "Great Western"

Produced since 1860 in the Finger Lakes region of New York, from grapes grown under soil and climatic conditions matching those of the great wine-producing regions of France, Great Western wines have been well recognized by the medical profession

All Great Western Champagnes are made by the old French method of secondary fermentation in the bottle They thus possess the optimum carbon dioxide content Yet Great Western sells at a most reasonable price

GREAT WESTERN WINES

Vermouth Dry and Sweet

Champagnes Dry, Medium and Sweet The American champagne that won medals in Paris, Brussels and Vienna

Still wines (under 14% alcohol) Sauterne Rhine, Claret, still Burgundy

Still wines (18% alcohol) Sherry Port, Tokay, Sweet Catawba Muscatel

PLEASANT VALLEY WINE COMPANY

Rheims, N Y

of Hemorrhagic Ulcer of Stomach or Duodenem", Dr Joseph J Eller, New York—"Cosmetic Results in Treatment of Skin Tumors", Dr James Ewing, New York—"Traumatic Origin of Brain Tumors", Dr Lee M Hurd, New York—"Sinus Operations" (with colored movies), Dr Fred H Albee, New York—"Surgical Restoration of Motion in Bony Stiff Joints"

President Roosevelt, Secretary of State Cordell Hull and Dr Leo S Rowe, Director General of the Pan American Union, endorsed the purposes of the Association and its Cruise. President Roosevelt said

"The significance of the exchange of medical and scientific information between our twenty-one neighboring nations can scarcely be overestimated. Indeed, the Pan American Medical Association represents an all-America's team battling against disease and extending the benefits of modern science and preventive medicine. I have been familiar for several years with the activities of the Association. I am especially interested at this time to learn of your seventh annual medical Cruise Congress to Havana and other countries in the West Indies this winter and wish it every success for it is important not only in its sympathetic purpose but in promoting understanding and cooperation among all peoples in the Western Hemisphere."

Secretary Hull's endorsement was as follows

"I need hardly assure you of my interest in the activities of private organizations such as yours which have for their purpose the interchange of ideas and the promotion of friendly relations between the scientific and professional men of the American Republics Your organization, in bringing together each year prominent and reputable physicians and scientists from the various American Republics, with the resultant interchange of scientific knowledge, is contributing to the improvement of cultural relations, the importance of which was recognized at the recent Buenos Aires Conference I believe that an interchange of scientific information should be encouraged in every appropriate manner and I am happy to find that the Credo of your organization emphasizes this important activity The Department is always interested in being informed of every serious and responsible effort to promote better inter-American relations and I appreciate your courtesy in writing me about your contemplated Seventh Cruise Congress I trust that the forthcoming cruise may be instrumental in contributing toward fulfillment of the purposes for which the Association has been organized."

Dr Rowe said

"Permit me to extend to you and to the officers of the Pan American Medical Association cordial congratulations on the service rendered in establishing closer relations between the members of the medical profession throughout the Americas You are thereby performing not only a scientific service but are also strengthening the cultural ties binding the nations of the Western World to one another Let me wish you the fullest measure of success in this fine undertaking, and assure you that it will always be a pleasure to be of any possible service in furthering the purposes which you have in view

TWELVE OF THE FAMOUS "57 VARIETIES" SPECIALLY MADE FOR HIM!

YOU can be sure that Heinz Strained Foods fulfill the high standards of excellence you demand in baby foods. For they are made by a company already 69 years wise in the ways of preparing *quality* food products

Heinz uses "first choice" fruits, vegetables and other ingredients—cooks them by scientifically controlled methods Here's the best guarantee of satisfaction in the food industry!

Heinz-Made Means Best Made

It's easy to see why a superior brand of strained foods emerges from Heinz Kitchens. Carrots, peas, beans, tomatoes—all are pick-of-the-garden variety And they're prepared in *air-tight* dry steam retorts Vitamins and minerals are retained in high degree Result Heinz Strained Foods contain the nutrients baby needs!

Consider all this—top it off with Heinz *proved* quality reputation—and you'll agree Heinz Strained Foods are best for the infants in your care! Surely, they deserve your personal endorsement and outspoken recommendation.

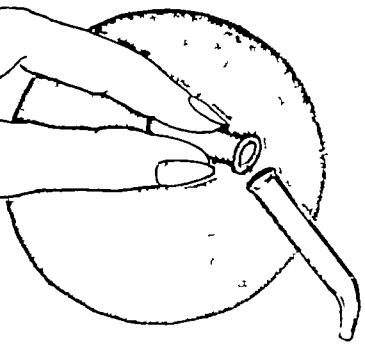
★ OLEUM

is now supplied



new Vacap-Dropper*

1. Economical

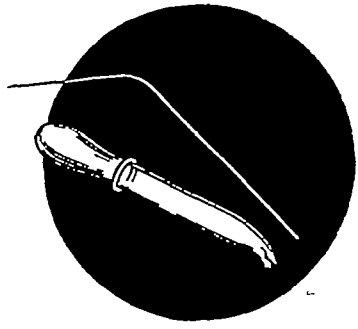
There is no loss of oil if the bottle is accidentally upset. As Mead's Vacap-Dropper need never be removed from the bottle, there is no danger of spilling valuable oil and soiling clothing or furnishings.

2. No Deterioration

Made of high grade bakelite, Mead's Vacap-Dropper is impervious to oil. In warm weather, oil often rises up into the rubber bulb of ordinary medicine droppers, initiating a chemical action which eventually deteriorates both oil and rubber. With this unique device, there is no glass or bulb to become separated while in use.

*Mead's Vacap-Dropper is supplied with the 50 cc size of Oleum Percomorphum which patients find economical in use. The 10 cc. size continues to be supplied with the regulation dropper.

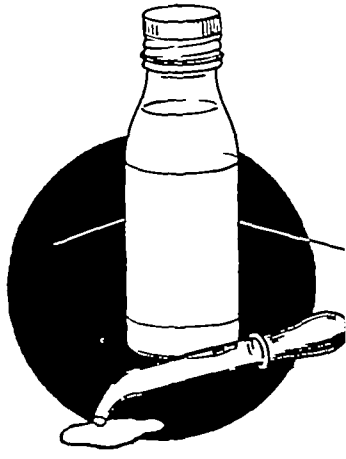
* (U S Pat Nos 2105023 and 101575)



OLEUM PERCOMORPHUM is an economical source of vitamins A and D 100 times as potent as U.S P cod liver oil For the prevention and treatment of rickets and tetany, to prevent poor dentition due to vitamin D deficiency, for pregnant and lactating women, for persons on restricted diets, to aid in building general resistance due to deficiency of vitamin A, and wherever cod liver oil is indicated

thically Marketed
Not Advertised
to the Public

PERCOMORPHUM



n the 50 cc. size with the

3. Unbreakable

lead's Vacap-Dropper will not break even when ie bottle is tipped over or dropped. No glass the dropper to become rough or serrated.

4. No "Messiness"

lead's Vacap-Dropper protects against dust and incidity. The surface of the oil need never be xposed to light and dust. Nor is there any hance for dropper to roll about and collect bac-eria or for oil on it to become rancid from epeated exposure to light and air.

5. Accurate

his new dropper, after the patient becomes ccustomed to it, delivers a uniform drop.

How to Use

MEAD'S *Vacap-Dropper*

emove both top and side caps Wipe dropper tip Regulate rate of low by using finger to control entrance of air through top opening see Illustration No 5) Oleum Percomorphum is best measured into he child's tomato juice This is just as convenient and much safer han dropping the oil directly into the baby's mouth, a practice vhich may provoke a coughing spasm

OLEUM PERCOMORPHUM

CHRONIC CONSTIPATION

prescribe

SHEFFIELD

B. ACIDOPHILUS MILK

'Council approved', produced according to the standard established by Dr H A Cheplin and prepared daily under the doctor's personal supervision at the

Cheplin Biological Labs, Inc
Syracuse, N Y

'Every bottle is individually dated to protect potency of product

A long list of investigators have confirmed the therapeutic value of B acidophilus milk in relieving cases of chronic constipation, as well as those of fermentative diarrhea, gastro-enteritis, mucous colitis, and intestinal putrefaction

Clinical experience has revealed that for best results in regulating bowel movements, the B acidophilus milk treatment should be maintained without interruption for from six to twelve weeks In obstinate cases of long standing, a little longer period of time may be required. In such cases, the culture should be reinforced with lactose

B acidophilus milk may be administered safely to children, but, as in the case of adults, only a standardized and Council accepted product should be prescribed

For sample and literature write or phone the

BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy.

KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

TRYPARSAMIDE MERCK IN NEUROSYPHILIS

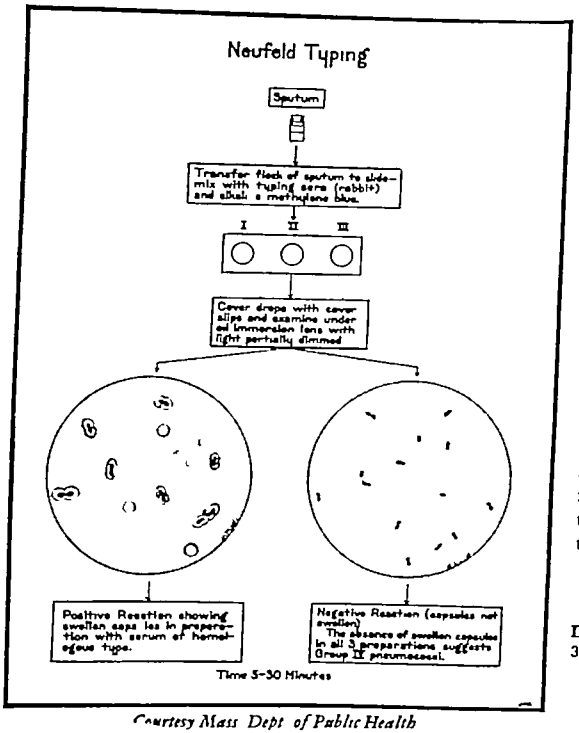
Brain of dementia paralytica

The unusual power of penetration of Tryparsamide Merck, especially in case of the central nervous system, and its ease of administration, have established it as a standard remedy, under proper control, in selected cases of dementia paralytica, tabes dorsalis, and some other forms of neurosyphilis

Clinical reports and treatment suggestions on Tryparsamide Merck in neurosyphilis are available on request

MERCK & CO. INC. *Manufacturing Chemists* **RAHWAY, N. J.**

"Early" is the watchword in



PNEUMONIA CONTROL

IN A RECENT ISSUE OF THE HEALTH OFFICER, the following watchwords were promulgated for the control of pneumonia

"*Early* diagnosis, *early* typing and *early* serum treatment mean *early* recovery"

The importance of *early typing* cannot be overemphasized, for it not only serves to identify the specific etiologic agent of the pneumonia, but frequently, and especially in atypical pneumonias, it also aids in fixing the diagnosis and makes possible the early administration of specific serum

The Neufeld Rapid Typing reaction should be applied to the patient's sputum immediately upon suspicion of lobar or bronchial pneumonia

Courtesy Mass Dept of Public Health

"Pneumococcus Typing Serum *Lederle*" Types 1 to 32 for the Neufeld Reaction, ready for immediate use, are available in 1 0 cc vials and in packages of 5 capillary tubes for individual tests

An editorial in the December 4, 1937 issue of the Journal of the American Medical Association states

"In view of the distribution of pneumonia and the known effectiveness of serum when given early in the most fatal types, the facilities for typing are of the utmost importance

A printed list of 2000 laboratories in the United States and Canada to which sputum may be referred by practitioners for typing has been published in directory form by Lederle and may be obtained free on request to

Lederle

LEDERLE LABORATORIES INC.

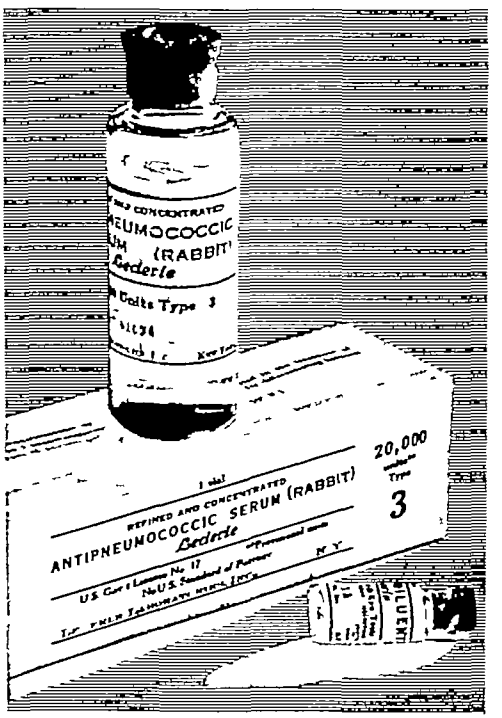
Announcing . . for the higher pneumococcus types

ANTIPNEUMOCOCCIC RABBIT SERA



(Including Type 3)

THE DEVELOPMENT OF THERAPEUTIC RABBIT SERA for the higher type pneumococcus pneumonias is important news Now physicians are afforded a specific measure for the treatment of pneumonia types some of which (notably Type 3) frequently terminate fatally and for which routine therapeutic measures only have heretofore been available Clinical results with some of these serum types have been highly encouraging as far as they have gone and there have even been cures of bacteremic cases in Type 3 and other higher-numbered type infections

Lederle Laboratories now announce rabbit sera for Type 3, Type 6 and Type 14 Sera for additional types will follow within a few weeks in the expectation that therapeutic sera for all 32 types of pneumococcic pneumonias will become available during the winter

Sera of effective potency in many of these higher types cannot be produced in horses Sera for these higher types are produced in rabbits and have been successfully refined and concentrated as much as ten times This permits dosage of high unitages with reduced danger of serum reactions

Upon the first suspicion of lobar or bronchial pneumonia the patient s sputum should be examined by the Neufeld Rapid Typing method to identify the type of pneumonia

How the Deaf Hear with
CORONATION ACOUSTICON

This diagram of the ear will help you explain both bone conduction and air conduction to your patients Interestingly colored, it will look very attractive on the wall of your office We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD, the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE for custom fittings on the Auroguage and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service

• HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS, but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye-glasses. Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations Send us the names and addresses of these "hard to convince" patients Of course, your name will not be mentioned in our correspondence with them—unless you say so

A FRIEND SUGGESTED THAT PHYSICIANS MIGHT LIKE TO KNOW ABOUT THIS

May we send you a ZEUS . . . with our compliments?

QUITE remarkable popular success has been accorded the device described in the advertisement reproduced above on the facts there stated

Now, friends in the medical profession suggest that physicians generally might like to know more about a device which removes from tobacco smoke such a substantial percentage of undesirable constituents that may otherwise reach the respiratory system

We should like to send, to any physician interested, a complete report of laboratory tests with a complimentary Zeus *Filter-Holder* for his own use and observation (The name ZEUS, incidentally, was chosen for mnemonic value) Please address, on your letter-head ZEUS CORPORATION, 745 Fifth Ave, New York, N Y

A TRUE IODIZED OIL

LIPIODOL (LAFAY)* IN DIAGNOSTIC RADIOLOGY

Lipiodol is not a chloro-iodized oil—it contains no chlorine. Chemical titration is not necessary to detect deterioration as is the case with chloro iodized oils

These, briefly, are the eight essential features of Lipiodol (Lafay)

1 The original French iodized oil
2. Not a chloro-iodized oil
3. Light amber color — helps detect deterioration
4 Bland and well tolerated even by delicate tissues
5 Relatively non-irritating and non toxic
6. Precise, clear cut, sharply outlined radiographs
7 Facilitates diagnosis of many obscure conditions
8 Reveals pathologic conditions which ordinary radiographs cannot visualize.

*Iodized Poppy-Seed Oil 40%

Please send for booklet "Lipiodol in Radiologic Diagnosis"

LIPIODOL (LAFAY)

CANNED FOODS IN THE CONTROL OF SUBACUTE DEFICIENCIES OF THE ANTI-PELLAGRIC FACTOR

As a result of his classical researches, Goldberger first proposed the name "Pellagra Preventive Factor" for that component of the vitamin B complex which he found effective in the prevention of human pellagra Subsequently, the terms vitamin "G" and sometimes vitamin "B_2" were used to designate this effective factor However, until biochemical research has conclusively established its identity, it is now apparent that we had best return to Goldberger's original designation for that entity which protects the human against pellagra

In contrast to the other vitamin deficiencies, cases of severe deprivation of the anti pellagric factor are not uncommon in certain regions of the United States It is also known that if the intake of food be drastically restricted for some reason—alcoholism, for example—pellagra may be encountered in localities in which the disease is not endemic (1) For these reasons, it is not unreasonable to suspect that subacute or latent deficiencies of the P-P factor may also be existent in this country

In the absence of typical dermatitis, available means for the diagnosis of deficiencies of the anti pellagric factor are not entirely satisfactory The practitioner must rely upon a variable group of less specific symptoms such as glossitis, diarrhea, digestive disturbances, and nervous and mental disorders However, consideration of these symptoms along with an evaluation of the diet upon which the subject had been maintained, may permit the conclusion that suboptimal intake of the P P factor should be suspected

The treatment of severe or perhaps even the mild manifestations of this dietary deficiency may require intensive therapy with food products or preparations known to be rich in the pellagra preventing factor However, prevention of pellagra and maintenance of the cure appear to be largely matters of dietary regulation In this connection, commercially canned foods deserve particular mention

Goldberger and his associates directed considerable attention to evaluation of the pellagra preventive powers of common foods The values of foods, many of them canned foods, in the prevention of pellagra have been determined (2) by investigations in which human subjects were used

In view of these facts, it is apparent that certain commercially canned foods will prove reliable, convenient and economical in the formulation of diets calculated to protect against mild or severe deficiencies of the P P factor

ANTI-PNEUMOCOCCIC SERUM

Refined and Concentrated Globulin

One-Sixth the Volume

The Research Laboratories of The National Drug Company have made intensive studies of producing and refining Pneumonia Serums. Methods of immunizing horses, and improved processes, enable us to offer a standardized serum, with a decrease of inert solids and proteins.

The Serum is Standardized

Felton International Units

Monovalent Anti-Pneumococcic Serum Type I contains
10,000 Type I Units in Syringe

Bivalent Anti-Pneumococcic Serum Type I and II contains
10,000 Type I Units and 10,000 Type II Units in Syringe

Furnished in perfected syringes with chromium (rustless steel) needles

The Serum Should Be Given Every 6 to 8 Hours

Pneumonia Typing Serum (Rabbit) for Neufeld-Sabin Method "quellung" supplied in capillary tubes and 1 cc ampul vial

ACCEPTED AMERICAN MEDICAL ASSN

FOR COLD PROPHYLAXIS

"A *and* D *not enough? On whose authority?*"

"WHAT, all the vitamins plus essential minerals necessary for adequate cold prophylaxis? Logical, of course," says the busy practitioner, "but on whose authority?"

Alert to modern concepts, he finds himself in full accord with the statement of Mellanby[1], that "there is general agreement among medical men that the susceptibility of mankind to many types of infection is closely related to the state of nutrition"

All the vitamins, in particular, as Eddy and Dalldorf[2] point out, "act in as unique and characteristic a fashion in maintaining bodily defense against infectious elements as they do in maintaining body structure"

Importance of Each Vitamin

Of vitamin A, the Council on Pharmacy and Chemistry of the American Medical Association[3] has written "Present indications are that vitamin A is an aid toward establishing the resistance of the body to infections in general" And reports by Bloch[4], Sherman and Burtis[5], and McCollum and Simmonds[6], agree—with special emphasis on resistance to respiratory diseases

Of vitamins B_1 and B_2 (G), Robertson[7] says that their deficiency in the diet results in lowered resistance to infection The conclusions of Eddy and Dalldorf[2] are equally decisive.

Sherman[8] reports of vitamin C that "long continued low intake of the vitamin increases the susceptibility to infectious disease, and conversely, the resisting power of the body is increased by a diet containing ample supplies of vitamin C"

Lack of vitamin D leads to disturbed mineral metabolism Hess[9] has shown that cases of D-avitaminosis reveal an increased incidence of respiratory infection, a finding confirmed by Madu and Eckhard[9]

The imperativeness of proper mineralization for metabolic vigor has long been accorded full recognition in the literature. Most recent contributions have pointed to the heavy dependence of vitamin efficacy on the presence of minerals—for instance of vitamin D on calcium and phosphorus, as Sherman[8] and others have reported. This cooperative interrelationship emphasizes the necessity for concurrent mineral intake

Efficacy of Multiple Concentrate

These considerations are borne out by Eddy's[10] reports of extensive laboratory tests run at Columbia University, conclusively demonstrating the superior results attained by administration of a comprehensive vitamin-mineral concentrate over those elicited by A-D or A-B-D-G preparations

Today the busy physician no longer has to puzzle out a vitamin-mineral formula for his "cold susceptible" patients In Vi-Syneral he has available a balanced concentrate of the six definitely known vitamins, A, B_1, B_2 (G), C, D, and E, fortified with the eight essential minerals—calcium, phosphorus, iron, copper, iodine, manganese, magnesium and zinc. Vi-Syneral is prepared under the direction of Drs Casimir Funk and H E. Dubin—pioneer authorities in vitamin research and therapy

The dosage is one vitamin and one mineral capsule daily—with any meal

®Ralston Wheat Cereal

When you think of expensive, complicated vitamin concentrates it's difficult, we know, to believe this simple statement. Yet Ralston Wheat Cereal *does* cost less than 1¢ for a generous bowlful—and that same bowlful provides 2½ times as much vitamin B as a similar serving of natural whole wheat.

That's because Ralston Wheat Cereal is fine, full-flavored wheat—enriched with sufficient quantities of pure wheat germ to make it 2½ times richer in this precious vitamin B which does so much to keep appetite and digestion normal (Each gram of Ralston contains 1½ International units of vitamin B)

In addition, Ralston is completely cooked and readily digested after 5 minutes over an open flame Research Laboratory Report and samples of Ralston Wheat Cereal will be sent to you on request. Use the coupon

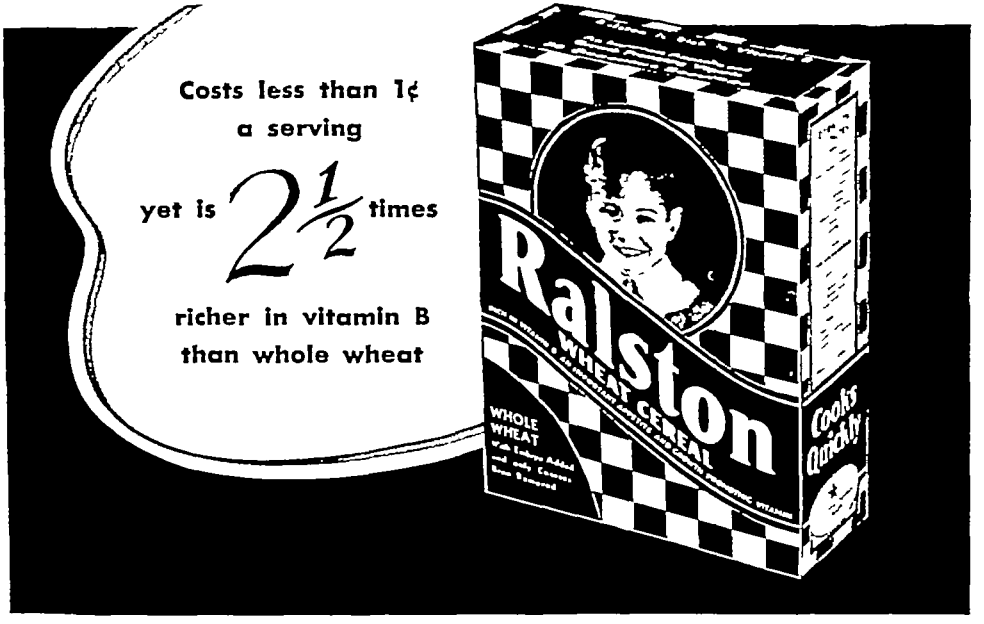
milk

a necessary "protective" food in reducing regimens

To the physician, it is an elementary fact that a reducing regimen, based on a decreased caloric intake, *must* contain an adequate quantity of the "protective" foods, such as milk, fruit and green vegetables But this fact is often unknown, or overlooked, by the layman



In its campaign to increase milk consumption among adults, the State of New York is emphasizing the importance of the "protective" foods calling attention to the dangers of unscientific dieting . . and suggesting that the regimen should be under the guidance of a competent physician This advertising is attempting to educate people who want to lose weight on the safe way of doing it *The Bureau of Milk Publicity, Albany*

Those 25 Patients *who can be saved*

Of one hundred cases developing type I pneumonia, seventy will recover and five will die regardless of treatment. The remaining twenty-five will die without treatment, but can be saved by prompt administration of Antipneumococcic Serum, Felton.

Reports in recent medical literature have shown that the very early use of specific antipneumococcic serum is important. In a series of 160 type I pneumonia cases (R. L. Cecil J. A. M. A. 108:689, 1937) in which specific antiserum was given within twenty-four hours of onset, mortality was reduced to one-third the usual rate in serum-treated cases, and to one-sixth the average rate in cases not receiving serum.

Antipneumococcic Serum (Felton) Type I, Refined and Concentrated, is available in syringe packages containing 10,000 and 20,000 units. Antipneumococcic Serum (Felton) Types I and II, Refined and Concentrated, in syringe packages containing, respectively, 10,000 and 20,000 units of each type.

JOURNAL *of* MEDICINE

OFFICIAL ORGAN OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Vol 38 FEBRUARY 1, 1938 No 3

SURGICAL DISEASE OF THE COLON

CHAS GORDON HEYD, B A, M D, F.A C S, *New York City*
Professor of Surgery New York Post-Graduate Medical School, Columbia University

It is evident that the human colon is an organ of remarkable endurance and in its evolutionary development has been subjected to almost every conceivable kind of chemical and mechanical trauma If one eliminates the various types of colitis it is surprising how few major affections there are of the colon It is very definitely established that the colon has specific functions and yet in the carrying out of its work it is capable of considerable adaptation to changing conditions The cecum and ascending colon continue, as it were, the main physiological function of the terminal ileum and from the midpoint of the transverse colon to the sigmoid we have a loss of the fluid contents of the bowel and the concentration and molding of the fecal content into its habitual expression of rounded, cylindrical-formed stool

The reports from surgical clinics indicate that of all colon work, two-thirds represents malignancy and one-third conditions other than malignancy, such as chronic ulcerated colitis, hyperplastic tuberculosis, polyposis, adenomatosis, diverticulitis, and Hirschsprung's disease. Rankin makes a most significant statement "It is a statistical fact that just about as many patients with carcinoma of the right half of the colon are operated upon for chronic appendicitis and chronic cholecystitis as patients with carcinoma of the rectum are operated upon for hemorrhoids"

From a diagnostic standpoint the large bowel may be divided into two portions, a right half and a left half In malignancies involving the right half of the colon there are certain features that are not present in malignancies of the left half of the colon The types of malignancy in the cecum and ascending colon are as a rule the adenocarcinomata These growths are flat, extend circumferentially, become excavated, are associated with the loss of microscopic blood at all times, provide a large area of absorption for both their own byproducts and the disturbed byproducts of the bowel, do not produce obstruction, do not metastasize early, have a relatively moderate degree of virulence, and tend to remain local for a relatively prolonged period of time As a rule, their clinical course is not accompanied by a fecal evacuation of gross blood, but blood is practically always present chemically Clinically, their most outstanding symptom is a progressive and continuous anemia In fact, so startling is the anemia that the mere inspection of a patient may suggest a malignancy of the stomach or of the right half of the colon So frequent is the rather pronounced stage of anemia present without local or disturbing symptoms, or gross impairment to appetite that the presence of such anemia in a patient in the late third or early fourth decade is sufficient to call for a diagnostic interpretation of the anemia with the

sided tumors than in left-sided, and blood transfusions, pre- and postoperative, are of great assistance There seems to be added to the patient's resistance, by the giving of blood, a vital impetus quite in excess of the amount transfused

4 Measures are instituted for overcoming dehydration This can be accomplished ordinarily by obtaining a normal water-balance. A water-balance chart with all the factors of water loss and water replacement by hypodermoclysis or intravenous administrations is of great assistance A reasonable and judicious amount of dextrose is added to the solutions given intravenously, but great care should be taken not to overflush the circulation with dextrose solution The presence of sugar in the urine after intravenous medication is evidence that the dextrose has "spilled over" and is of no value to the patient

5 Measures are undertaken to prevent the absorption of bacteriolytic material, particularly in the right-sided neoplasms In the cecum there is a large area for the absorption of broken down tissue as well as fecal and bacterial products From one-third to even one-half of the feces is composed of bacteria with maximum virulence and it is readily apparent that there are great possibilities for the absorption of highly toxic material Colon irrigations with normal saline to which may be added tincture of quassia, ℥ii to the quart are very useful

6 Nutrition is maintained by a high caloric, nonresidue diet plus excess intake of fluids and fruit juices Calcium lactate, ℈i q 4h, has proved of value in our experience

At operation it is many times doubtful if the surgeon can accurately determine whether the glandular involvement contains metastases or is only the result of septic absorption All operations on the large bowel should be planned to extirpate the primary growth and all the gland-bearing tissue anatomically connected with the neoplasm The philosophy behind this procedure is that the operation is one that plans to remove all the affected bowel plus the epicolonic, pericolonic gland groups, and the main gland depositary at the base of the chief artery to the part This, therefore, means that most operations will carry with them a large bowel area plus the gland-bearing tissue, leaving behind a raw and in many cases incompletely peritonized surface Invariably and inevitably in this area will be a collection of serum The effect of serum collection in proximity to an operative wound means infection, abscess formation, and the increase in the possibilities of a lethal complication—peritonitis In addition, the absorption of serum, even if noninfected, entails an added burden upon the liver Since many of these patients are already subjected to the uttermost demands upon their reserve, the addition of extra increments of hepatic damage by absorption of protein fluids should be avoided Hence the advisability of providing adequate drainage of all of these areas Most surgeons are inclined to believe that drainage is purely a mechanical mechanism This is a misconception of the primary function of drainage which is biological and is (1) to prevent the accumulation of body fluids from being retained under pressure, (2) to prevent primary nonseptic body fluids from becoming infected, and (3) to prevent their systemic absorption

Resection of the tumor should be accomplished without the consideration of anastomosis at the time of resection The Mikulicz operation, *per se,* has a very limited field and there is a hazard in allowing the malignant tumor to remain on the anterior abdominal wall The possibilities of metastasization on the abdominal wall has been estimated at twelve per cent and we have had a few cases that have developed a fulminating gas gangrene of the abdominal wall with fatal termination

Postoperatively we are concerned with the treatment of peritonitis which may be actual or impending This will require the following routine measures

TABULATION OF TREATMENT OF PERITONITIS

Preoperative—operative—postoperative

1 Nothing by mouth—Ochsner "Rest and Starvation."

2 Gastric drainage—indwelling nasal Levine tube.

3 Fowler position
- (a) Angulation of bed, 35°
- (b) Angulation of patient.

4 Morphine for pain or restlessness

5 Prevent dehydration—amount lost by stomach + 3000 c c.
- Proctoclysis, Murphy
  - Tap water + ten per cent glucose
- Hypodermoclysis
  - N/10 Saline

possibility of a cecal carcinoma in mind

The degree of anemia may be so severe as to suggest pernicious anemia Apparently the blood deficiency bears some relationship to the surface area of the neoplasm and the rapidity of absorption of pernicious protein byproducts

Neoplasm of the right colon is occasionally detected quite by accident, particularly among physicians, nurses, and other professional people who from apprehension have a barium colon enema examination The anemia of right colon tumors is associated with varying degrees and varying types of dyspepsia

In the consideration of the left half of the colon this segment of the bowel must be considered separately from the rectum and rectosigmoid It may be roughly described as beginning at the midpoint of the transverse colon and terminate where the sigmoid passes into the rectosigmoid Malignancies in this portion of the bowel tend to be more of the scirrhous type and are invariably associated with the development of obstructive symptoms and frequently gross blood in the stools They, however, are not associated with the continuous and constant leakage of blood such as characterizes right-sided neoplasms The bowel behind the obstruction hypertrophies and there is usually some intestinal cramp and increased borborygmus There is not a marked depreciation in health nor does the anemia develop to a comparable degree in left-sided tumors Such impairment of appetite and general nutrition as may be present is largely due to the chronic obstruction It seems that the further down the colon tube the growth is situated the more apt is obstruction to become pronounced and gross hemorrhage more frequent

Rankin found that in the right colon sixty-six per cent of the patients without nodal involvement were alive at the end of the five years, fifty-six per cent of the cases of the left colon, and forty-eight per cent of the cases of the rectosigmoid and rectal cancers In sharp contradistinction to these were the results when nodal involvement was present The right colon showed thirty-nine per cent cures, the left colon twenty-nine per cent, and the rectum and rectosigmoid twenty per cent

In the diagnosis of surgical affections of the colon *per se,* the greatest precision rests with the expert roentgenologist The method used is an opaque medium by rectum, plus palpatory examination under the fluoroscope The specificity of the lesion, the degree of obstruction, its fixity to neighboring viscera, and the general tonus of the intestine are all capable of differentiation in the hands of the roentgenologist

In the symptomatology of rectal carcinoma, probably the symptom that is most frequently present and yet to which little weight is attached is a change in bowel sensitivity In other words, a change in the daily bowel habits of the individual Neither constipation nor diarrhea are significant signs in the early stages yet blood will be passed in seventy per cent of the cases and rectal pain will be present in almost the same number Seventy per cent of tumors of the rectum are within reach of the palpating finger in the rectum and nearly one hundred per cent are within the resources of the palpating finger and sigmoidoscopic examination Neoplasms of the rectum and rectosigmoid are very frequently missed in the contrast barium colon enema for the barium mixture will flow into the rectum rather rapidly and fill out the pouch above and below the rectal tumor and present no evidence of luminal deformity

The principles that must underlie surgery for malignancy of the large bowel must rest upon the following

1 The physical condition of the patient —the age, the duration of the growth, the presence of coexisting disease of the heart, blood vessels and kidney will largely determine the degree of general preparation that will be necessary In many of the neoplastic lesions of the large bowel obstruction is an element and even if it is only partial will require preoperative bowel therapy and in many cases preliminary operative decompression of the bowel

2 The nature of the growth and its localization will be factors in the preoperative survey of the patient Patients with tumors of the cecum and ascending colon with their large, sloughing mass, marked anemia from nutritional impairment, will require preoperative measures to lessen the local absorption and transfusions to bring back the blood to a relatively normal state

3 Anemia is more pronounced in right-

nonspecific hyperplastic inflammatory change There is infiltration of the wall by round cells, hyperplasia of connective tissue, deformity of the lumen, narrowing and degress of stenosis from almost minor degree to complete intestinal obstruction The frequency with which this affection is associated with the terminal ileum has given the designation of terminal ileitis, yet the same mechanism occurs in other portions of the bowel The condition may be multiform, as in one of my patients there were four definite sites of this condition—the terminal ileum and ascending colon the transverse colon, and the descending colon and sigmoid This condition is described at length by Burrill Crohn, Berg, and numerous other authors It has been recognized by surgeons for many years It is not to be confused with discrete hyperplastic tuberculosis of the cecum which is occasionally met with in the course of routine abdominal diagnosis and occasionally during the removal of an appendix

In discrete tuberculosis of the cecum there is many times very little systemic deterioration and the proper therapy is surgical removal, preferably at one stage. Prognosis is excellent and the operative mortality not high

Diverticula occur throughout the entire intestinal tract, particularly in the colon and occur in five per cent of routine colon examinations For a long time it was supposed to be the precursor of malignancy, yet Brown and Rankin at the Mayo Clinic observed only four cases in a study of 227 that were complicated by carcinoma, an incidence of less than 1 8 per cent The danger that is inherent in diverticulitis, particularly of the sigmoid is (1) perforation with peritonitis (2) perforation with abscess (3) hemorrhage (4) fixation of the bowel (5) perforation into adjacent viscera, particularly the bladder with the formation of fistula So aptly does it mimicry acute perforating appendicitis that it has been spoken of as left-sided appendicitis

By perforating or perforation a coincident plastic peritonitis is set-up, producing a tumor mass frequently in the region of the sigmoid, although the same mechanism may be evoked in other portions of the colon The weight of opinion seems to be that diverticulitis *per se* does not produce obstructive symptoms and is not associated with bowel hemorrhage and that the presence of some degree of obstruction and hemorrhage is rather the characteristic of a malignancy or the verging of a nonmalignant diverticulitis into one of malignant degeneration

Aside from the complications, the patient is best treated by conservative measures and only when some outstanding complication occurs, such as the necessity for drainage of an abscess or the correction of vesicocolonic fistula, should surgery be entertained Medical therapy, regulation of diet, the interdiction of enemata are the main features of treatment

Continued observation indicates the role of polyopsis in the development of carcinoma of the large bowel and one is impressed with the strong familial and inherited tendency for bowel polyposis. Any surgeon with fair experience in colon surgery has been impressed with the finding of a carcinoma so definitely placed and in which all the tissue connections are so definite as to have little doubt in his mind that polyposis is the forerunner of many cases of malignancy It has the most pronounced tendency to undergo malignant transformation The disease usually affects youth, is characterized by blood from the rectum and profound anemia Fitzgibbon and Rankin found twenty-four definite and discrete carcinomas in twelve patients who had multiple polyps of the colon Only two were without carcinomatous degeneration They further reported twenty-four carcinoma in eleven cases of polyposis, a ration of eight to three Rankin further states that in fifty-eight per cent of cases of familial polyposis, definite malignancy is present

6 Prevent hypochloremia and alkalosis
Replace fluids and chlorides lost in vomitus
Intravenous method
(a) Two—four per cent hypertonic saline
(b) Ten c c of 1 1500 solution hydrochloric acid
(c) 1000 c c intravenous distilled water, alternating with ntravenous solutions of normal saline
7 Surgical intervention—operations for intestinal obstruction
8 Prophylactic injections of anti-gas serum pre- and postoperatively

From the physiological point of view it is highly desirable that peristalsis be completely inhibited for as long a period as possible, therefore nothing should be given by mouth to these patients until there has been a spontaneous passage of gas and certainly not before seventy-two hours Water balance for the prevention of dehydration may be accomplished readily without much distress to the patient with measures which are routine Morphine may be given for the abolition of pain, prevention of pain and restlessness, and the inhibition of peristalsis

Chronic ulcerative colitis is a most pathetic picture, occurring usually in young individuals and usually under careful medical regimen, and very rarely requires surgical intervention Its essential feature is its chronicity, having an insidious onset characterized by frequent stools, and the passage of blood plus mucus There may be occasionally dramatic and startling acute intermissions, characterized by high fever, pronounced prostration, marked dehydration, continuous bowel irritability, and frequent stools The picture is one of a profound toxic state The origin of this condition probably is in the rectum and proctoscopic examination will reveal innumerable punched-out ulcers surrounded by hyperemic areas, marked edema, and occasionally a peculiar glazed surface with marked increase of mucous formation and continuous exudation of pus As healing occurs in these ulcerated areas there is produced a marked fibrosis, resulting in a stiffening of the bowel, irregularity of the lumen, narrowing and fixation, together with loss of haustration If one has had the opportunity of seeing this bowel at operation he is impressed with the remarkable fragility suggesting a soft putty-like material that breaks on the slightest handling

Our experience with ileostomy for this condition has not convinced us of the essential desirability of surgery and if an ileostomy is done it is probably only a preliminary to an extirpation of colon which must be done at some later period Prolonged medical treatment, bowel therapy, and the treatment of the individual as a chronically ill patient, with the general principles of sanatarium treatment, will probably give better results than those heretofore obtained by surgery In this connection, one might allude to the frequency of marked hyperplastic lymph glands in the area of the ileum and mesentery, so-called mesenteric adenitis This condition occurs in young people, usually the thin, undernourished individuals, of easy fatiguability, with a marked tendency to chronic constipation and intermittent abdominal cramps Usually these patients have their appendices removed for the fear that an acute appendicitis might be overlooked or that it may intervene The appendix, as a rule, has a slight amount of lymphoid tissue, is erectile and turgid, and is associated with the glandular picture indicated above

Hirschsprung's disease has properly been limited to a nervous defect of the sympathetic nervous system It is interesting to recall that certain nodal points have been allocated to the gastro-intestinal tract and that from these nodal points there issues autonomic nervous impulses The continuous irritability of these fibers produces tonic contraction or spasm with pathological stasis This is the basic factor for the element of obstruction which is now usually ascribed as the causation of Hirschsprung's disease If these fibers and nodes are excised, there follows (1) diminution in size of the dilated colon, (2) lessened haustration of the colonic wall, with resultant colon motor activity, and (3) decreased function of the internal sphincter with less resistance at the anus

There arises in the region of the terminal ileum, and sometimes in the large bowel, a condition spoken of as ileitis and characterized by the development of a

nonspecific hyperplastic inflammatory change There is infiltration of the wall by round cells, hyperplasia of connective tissue, deformity of the lumen, narrowing and degress of stenosis from almost minor degree to complete intestinal obstruction The frequency with which this affection is associated with the terminal ileum has given the designation of terminal ileitis, yet the same mechanism occurs in other portions of the bowel The condition may be multiform, as in one of my patients there were four definite sites of this condition—the terminal ileum and ascending colon the transverse colon, and the descending colon and sigmoid This condition is described at length by Burrill Crohn, Berg, and numerous other authors It has been recognized by surgeons for many years It is not to be confused with discrete hyperplastic tuberculosis of the cecum which is occasionally met with in the course of routine abdominal diagnosis and occasionally during the removal of an appendix

In discrete tuberculosis of the cecum there is many times very little systemic deterioration and the proper therapy is surgical removal preferably at one stage Prognosis is excellent and the operative mortality not high

Diverticula occur throughout the entire intestinal tract, particularly in the colon and occur in five per cent of routine colon examinations For a long time it was supposed to be the precursor of malignancy, yet Brown and Rankin at the Mayo Clinic observed only four cases in a study of 227 that were complicated by carcinoma, an incidence of less than 1 8 per cent The danger that is inherent in diverticulitis, particularly of the sigmoid is (1) perforation with peritonitis (2) perforation with abscess (3) hemorrhage (4) fixation of the bowel (5) perforation into adjacent viscera, particularly the bladder with the formation of fistula So aptly does it mimicry acute perforating appendicitis that it has been spoken of as left-sided appendicitis

By perforating or perforation a coincident plastic peritonitis is set-up, producing a tumor mass frequently in the region of the sigmoid, although the same mechanism may be evoked in other portions of the colon The weight of opinion seems to be that diverticulitis *per se* does not produce obstructive symptoms and is not associated with bowel hemorrhage and that the presence of some degree of obstruction and hemorrhage is rather the characteristic of a malignancy or the verging of a nonmalignant diverticulitis into one of malignant degeneration

Aside from the complications, the patient is best treated by conservative measures and only when some outstanding complication occurs, such as the necessity for drainage of an abscess or the correction of vesicocolonic fistula, should surgery be entertained Medical therapy, regulation of diet, the interdiction of enemata are the main features of treatment

Continued observation indicates the role of polyopsis in the development of carcinoma of the large bowel and one is impressed with the strong familial and inherited tendency for bowel polyposis. Any surgeon with fair experience in colon surgery has been impressed with the finding of a carcinoma so definitely placed and in which all the tissue connections are so definite as to have little doubt in his mind that polyposis is the forerunner of many cases of malignancy It has the most pronounced tendency to undergo malignant transformation The disease usually affects youth, is characterized by blood from the rectum and profound anemia Fitzgibbon and Rankin found twenty-four definite and discrete carcinomas in twelve patients who had multiple polyps of the colon. Only two were without carcinomatous degeneration They further reported twenty-four carcinoma in eleven cases of polyposis, a ration of eight to three Rankin further states that in fifty-eight per cent of cases of familial polyposis, definite malignancy is present

ROENTGEN FINDINGS OF RENAL TUBERCULOSIS

HENRY K TAYLOR, M D, F A C P, F A C R. and LEONARD PAUL WERSHUB, M D, F A C S, *New York City*
From the Departments of Radiology and Urology, Sea View Hospital

Renal tuberculosis is ordinarily accepted[1-5] as a complication, secondary to a tuberculous infection elsewhere in the body Because of this impression which we believe to be erroneous, renal tuberculosis is not diagnosed as frequently as the lesion actually exists Undoubtedly, many cases of renal tuberculosis are incorrectly diagnosed in children as pyelitis and in adults as one of the common nonspecific renal infections The recognition of early renal tuberculosis is not always possible as some lesions can be diagnosed early while others cannot be detected until an advanced stage of the disease

As stated above it is generally believed that renal tuberculosis occurs as a secondary infection, secondary to tuberculosis elsewhere in the body, usually pulmonary It is our belief that this statement is ambiguous, and from our interpretation of statistical data is erroneous We believe that the tubercle bacilli reach the kidney or kidneys during the phase of the original or primary infection In this sense the kidney may be considered as infected secondarily, for the organisms are brought to it In reality this is not a true secondary infection, but must be considered as part of the primary phase which occurs during the stage of the bacillemia prior to the fixation of the tubercle bacillus We believe this fixation of organisms in the kidney or kidneys is the anlage in the majority of cases, which later is diagnosed as renal tuberculosis In a certain percentages of cases which we consider relatively small, renal tuberculosis develops as a secondary or complicating lesion

At Sea View Hospital, an institution caring for the tuberculous tuberculosis of the genitourinary tract was found in 3 8 per cent of 1121 consecutive autopsies[6] Reisner[7] reports an incidence of 49 3 per cent of extrapulmonary tuberculosis without any pulmonary involvement In a further subdivision, only one-third of his cases with genitourinary tuberculosis showed no evidence of a pulmonary lesion

Sutherland and Braasch[8] in a review of 1314 cases of renal tuberculosis (911 had the thorax x-rayed) state "In 280 cases (30 7 per cent) there was evidence of pulmonary tuberculosis, in the majority being latent, and in 631 cases (69 3 per cent) the findings were negative In 83 of the 1314 cases tuberculous lesions were co-existant in bone" In spite of these figures the authors claim "the consensus of opinion is that renal tuberculosis is never a primary condition, but is always secondary to involvement of the lungs, peri-bronchial or retro-peritoneal lymph nodes, or bone"

It is difficult for us to accept the statement that renal tuberculosis is secondary to pulmonary or osseous tuberculosis *If true, the incidence of pulmonary or osseous tuberculosis should be considerably higher than the recorded statistics* In a general way, the available statistics can be accounted for only by accepting the thought that the tubercle bacilli are arrested or fixed in the kidney during the phase of the primary infection and at some later time become virulent and produce a destructive lesion in the kidney which is recognized clinically and roentgenographically as renal tuberculosis

A review of the literature[1-5] shows a unanimity of opinion concerning the transportation of the tubercle bacilli by the blood stream, but a difference of opinion as to the site or sites of the primary localization of the tubercle bacilli in the kidney

Wildbolz and Ekehorn[9] believe the renal papilla is the site of election for the primary localization of the tubercle bacillus They believe that the bacilli localize here because of the decreased velocity of the blood at this point Medlar[10] states that the first lesion may localize either in the cortex, the medulla or in both In his series of cases the lesions were cortical

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester May 26, 1937

Fig 1 H W, male, white, aged forty Chief complaint, frequency of urination, pain in back, hematuria six months ago Tubercle bacilli obtained from bladder and from left kidney (a) Urographic examination Superior infundibulum presents multilocular appearance with constriction in superior portion of pelvis Slight dilatation of other calices (b) Pathological specimen Irregular abscess in region of superior infundibulum. From size and localization of this lesion, we assume that primary localization of tubercle bacilli occurred at renal papilla. Large cortical abscess not demonstrable on roentgenogram for there is no communication with renal sinus

in seventy-five per cent, medullary in eleven per cent, and were present in both in thirteen per cent Cabot, Crabtree[11] and others claim the earliest localization of the tubercle bacillus occurs at the base of the pyramid Some believed the tubercle bacilli are filtered out in the urine and then localize in the region of the narrowed portion of the collecting tubule distal to the glomerulus

From the above it is apparent that the tubercle bacilli can be localized in any part of the kidney, viz, papilla pyramid or cortex *The localization of the lesion is*

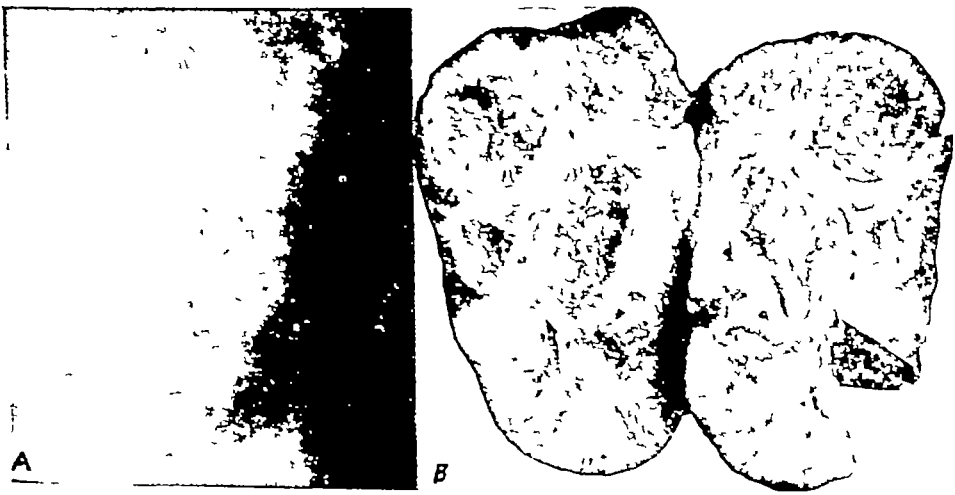

Fig 2 A.B., male, white, aged forty-three. Chief complaint frequent urination, day and night, and pain in left kidney region. Tubercle bacilli obtained from left kidney Bladder specimen negative. (a) Urographic examination reveals superior infundibulum to be irregular, enlarged and distorted (b) Pathological specimen abscess cavity in upper pole of kidney From size of lesion the primary localization of tubercle bacillus occurred at pyramidal base or in cortex.

of importance, for the site is the determining factor in whether the lesion can be recognized early or late

The urographic findings in renal tuberculosis depend upon the site of the primary localization In those cases where the lesion is localized at the apex of the pyramid, the lesions are recognized early only because the destructive process has altered the normal architecture of the infundibulum When the lesion is small it produces minute changes in the cup-shaped appearance of the calyx The change may be only a slight irregularity in the contour or an indistinctness which gradually becomes more marked and more extensive as the lesion progresses so that in time the calyx loses its normal contour It may now be enlarged irregular, and distorted (Fig 1)

As the tuberculous lesion progresses the architectural changes become more pronounced There is involvement of the adjacent calices and kidney parenchyma This type of lesion may occur in any portion of the kidney but is usually found in the upper pole The lesion may so involve the substance of the kidney that a calyx or even a portion of the renal pelvis may become completely obliterated Under such circumstances no contrast substances will enter the diseased area In reality an abscess cavity is present with no communication to the renal sinus (Figs 2, 3, 4, 5)

When the lesion is localized at the base of the pyramid early recognition is impossible because there is no alteration in the architecture of the renal sinus Not until this lesion progresses sufficiently to destroy a part of the excretory tubular system a part of the renal sinus, will roentgenographic evidence be available By this time the lesion is quite extensive for there is considerable destruction of renal substance This cannot be considered an early lesion even though the roentgen evidence is identical with the early manifestation of the lesion described above (slight irregularity in the contour of the calyx) where the lesion originally localized at the pyramidal apex From here the destructive process continues and the roentgen findings depend upon the degree of involvement of the renal sinus and renal tissue The advanced lesions present bizarre appearances and may be characterized by dilatations with

Fig 3 J L, male, white aged thirty-three Chief complaint, difficult frequent, and painful micturition for one year Tubercle bacilli obtained from bladder and left kidney (a) Urographic examination reveals destructive lesion of superior portion of renal sinus, presenting marked irregular collection of contrast substance in upper pole of kidney and stenosing tract to pelvis (b) Urographic examination fifteen months later reveals progression of lesion Shadow of contrast substance is smaller because of progressing cortical lesion encroaching upon renal sinus Cortical lesion is not demonstrable on the roentgenogram

Fig 4 N.K., male, white, aged forty Chief complaint, frequency of urination, pain in back during cold weather, hematuria six months ago Tubercle bacilli obtained from bladder and left kidney (a) Urographic examination shows deformity of renal sinus in upper half of left kidney (b) Roentgenographic examination of infected kidney shows nature and extent of lesion. (c) Pathological specimen shows multiple abscesses in upper pole of the kidney Primary localization of tubercle bacilli probably occurred at renal papillae.

markedly irregular contours, obliteration of the calices, detached irregular areas of contrast medium communications between isolated areas of necrosis and dilatation narrowing and almost complete obliteration of the renal pelvis (Figs 3 and 5)

According to Medlar[10] the localization of the tubercle bacilli most frequently occurs in the cortex (75 per cent) The early recognition of this lesion is impossible Not until the lesion becomes sufficiently extensive to destroy one or more of the calices will it be evidenced on the

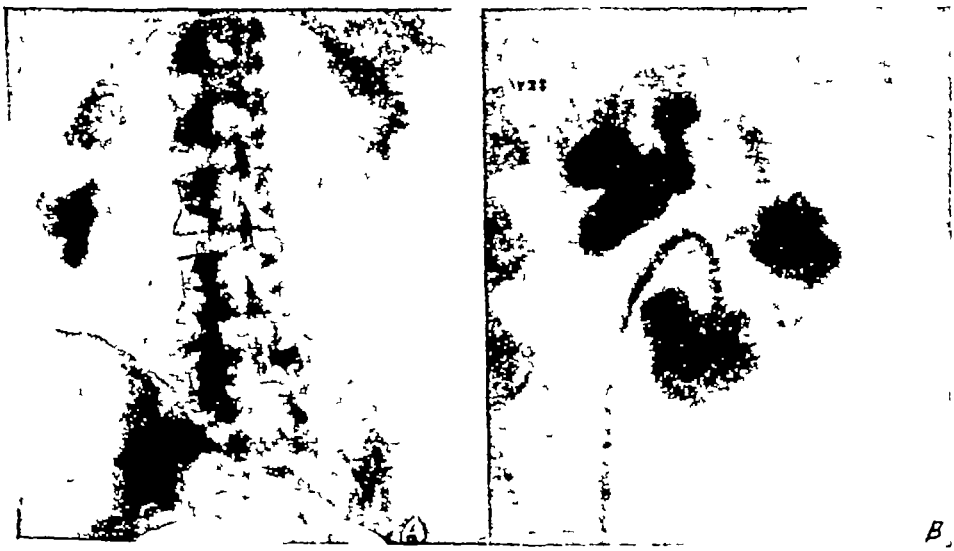

Fig 5 (a) Urographic examination shows extensive lesion involving upper half of right kidney occluding renal sinus in that area (b) Urographic examination shows extensive lesion involving entire kidney Due to destruction of renal tissue there is marked deformity of renal sinus, with strictures

roentgen film The lesions irrespective of where they start progress with a destruction of renal substance Destructive lesions of the kidney may be present with no communication with the renal sinus, and hence not demonstrable It is not unusual to find at operation or postmortem, multiple excavations in the kidney of which there were no evidences or indications in the roentgenogram (See Figs 2 and 5a)

It must be borne in mind that a negative pyelogram does not exclude renal tuberculosis

Wesson and Ruggles[2] claim that urography may be the only method of arriving at a diagnosis

The roentgenographic evidence is not indicative of the size or the extent of the lesion

The presence of small circular isolated calcific deposits,* either single or multiple, unilateral or bilateral, is usually considered as being tuberculous The presence of these calcific deposits is no indication of disease in the urinary tract It is our opinion that they represent the end or healed phase of the primary infection This type of infection in children is frequently overlooked In children, cases of unexplained temperature, with normal ear drums and pus cells in the urine, are diagnosed as pyelitis These cases are probably tuberculous infections of the kidney (part of the primary infection) which either heal spontaneously, with or without calcification, or else go on to a progressive destruction of the kidney We believe that a number of the lesions encountered in early adult life are probably an overlooked manifestation of childhood tuberculosis of the kidney

*Calcific deposits of the kidney are not as frequently encountered in the East when compared with the frequency of this condition reported in the Western States[12]

Summary

1 It is our belief that the commonly accepted statement that *renal tuberculosis occurs as a complication, secondary to a tuberculous infection elsewhere in the body (reinfection)* is not correct.

2 We believe tubercle bacilli are deposited in the kidney or kidneys during the phase of the primary infection, a subsequent activation of the organism produces disease

3 The primary localization of the organism can occur in any portion of the kidney, viz, renal papilla, medulla or cortex

4 Early recognition of the disease is only possible when the primary localization of the organism occurs at the renal papilla The lesion elsewhere in the kidney is only recognized when it deforms a portion of the renal sinus This cannot be considered an early lesion When there is no encroachment on the renal sinus, there is no roentgen evidence The roentgenographic evidence is not indicative of the size and extent of the lesion

5 The presence of small calcareous foci in the kidney are probably the healed or end stage of a primary infection, and is no indication of disease in the urinary tract

6 During infancy a primary lesion in the kidney may be diagnosed as a nonspecific pyelitis

MEDIASTINAL HODGKIN'S DISEASE

HAIG H KASABACH, M D and KENNETH R. MCALPIN, M D, *New York City*

From the Department of Radiology and Medicine, Presbyterian Hospital and College of Physicians and Surgeons, Columbia University

Between 1918 and 1935, 251 patients were admitted to the Presbyterian Hospital and Vanderbilt Clinic with the diagnosis of Hodgkin's disease Seventy-seven of these individuals, in whom the diagnosis was established by microscopic examination of a lymph node, had mediastinal involvement.

Golden[1] has suggested that the primary site of the disease may have a bearing on prognosis A lymphoblastomatous mass so located as to interfere with some vital process such as respiration may cause death much sooner than a similar mass located elsewhere It seemed of interest, therefore, to analyze the cases in which the mediastinum was involved to determine what relation there might be between treatment and the length of survival An attempt is also made to correlate the effect on the survival period of the distribution of the disease at the time treatment was begun

Material

In nineteen of the seventy-seven cases, the presenting manifestation of Hodgkin's disease was found in the mediastinum, as shown on roentgenograms, without associated lymphadenopathy elsewhere In these cases enlargement of peripheral lymph nodes became apparent on an average of eighteen months after the roentgen diagnosis of mediastinal adenopathy In the remaining fifty-eight patients with mediastinal involvement, Hodgkin's disease was present in various parts of the body at the time of the first examination

Of the seventy-seven cases with mediastinal Hodgkin's disease, twelve have been lost to follow-up and fifty-seven have died The remaining eight are living and two are at present in the terminal stage of the disease

Roentgentherapy and Survival Period

For the purpose of this study, the sixty-five cases that we have followed have been divided into three groups which are summarized in Chart I

The first group consists of seven cases who had no roentgentherapy Five died in less than three years, one died in four years, and one died seven years after the first admission The average survival period in this group was approximately three years and one month

The second group includes twenty patients who received roentgentherapy at varying irregular intervals The total number of treatments and amount of radiation were, according to our present knowledge, quite inadequate Of these, fifteen died in less than three years, three in less than four and one-half years, one in seven years, and one in nine years from the date of admission This makes the average survival period approximately three years and three months

The thirty-eight patients in the third group received long series of small fractionated doses of roentgentherapy to the mediastinum which might be termed adequate treatment. Of these, eight are still alive—seven from five to ten years, and one more than ten years after the first admission The remaining thirty patients have died Of these, eight died between one and three years, twelve between three and five years, and eight between five and ten years after the first admission The remaining two died after living over ten years It is interesting to note that in this group the average survival period is five years and four months, including eight of the patients who still survive.

Technic of Roentgentherapy

High voltage roentgentherapy has been used on the majority of this series of cases with mediastinal Hodgkin's disease The technical factors are 200 K V, 0 5 mm, 1 0 mm or 2 0 mm Cu + 1 0 mm Aluminum filter and 50 or 80 cm anode-skin distance The quantity varies from 50 r to 100 r per sitting per field, repeated at daily intervals alternating over anterior and posterior areas This plan is continued until each of the two fields has received 1000–1200 r, and in some cases

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

roentgen film The lesions irrespective of where they start progress with a destruction of renal substance Destructive lesions of the kidney may be present with no communication with the renal sinus, and hence not demonstrable It is not unusual to find at operation or postmortem, multiple excavations in the kidney of which there were no evidences or indications in the roentgenogram (See Figs 2 and 5a)

It must be borne in mind that a negative pyelogram does not exclude renal tuberculosis

SCIENTIFIC EXHIBITS

Announcement is made by Dr William A Krieger, Chairman, Committee on Scientific Exhibits of the Medical Society of the State of New York, that the time for filing applications has closed

All the space for this purpose has been taken up

Hodgkin's disease are fever, pruritus, and loss of weight When the lesion is intrathoracic, cough, dyspnea, and pain are occasionally encountered

Fever was present in twenty per cent of the patients with the disease limited to the mediastinal nodes When more widely disseminated, it appeared more frequently occurring in eighty-five per cent of such cases Roentgentherapy rarely affected the febrile course

Pruritus appears, in general, to depend more on the severity and extent of the disease than location In this series, pruritus occurred in only eight of seventy-seven cases (12 5 per cent), usually considered a late manifestation associated with extensive involvement

The routine treatment of pruritus is of little value in this disease. Menthol, phenol, calamine lotion, oils and creams, oatmeal and starch baths have been used with little or no success Roentgentherapy with various technics has been tried with occasional benefit Desjardins[2] has suggested that fever and pruritus with or without toxic or infiltrative lesions in the skin indicate invasion of the abdominal nodes He infers this because the symptoms disappear after roentgentherapy over the abdomen Recently, eight patients with pruritus were treated over the abdomen and liver One felt better and had no recurrence, two were helped for a short time, and the remaining five obtained no relief

The management of loss of weight and strength in patients with Hodgkin's disease is an important problem We believe they stand radiation much better when taking a substantial and easily digested diet The inanition is, of course, due to the disease and not to roentgentherapy Many of the patients, particularly in the late stages of the illness, continue to lose weight when the disease appears to be inactive in so far as lymphadenopathy is concerned It is an error to limit therapy to the specific Hodgkin's lesions and lose sight of the patient's general well-being To persuade people without appetite to eat, is extremely difficult Dr Marks,[6] a student of nutrition and metabolism in disease, came to our help Under his supervision, patients have been given insulin to stimulate the appetite then a diet high both in calories and vitamins The results have been most gratifying and indicate the value of this method of treatment

Cough and dyspnea were usually present when the mediastinum contained a large mass of lymph nodes Pain occurred rarely, even with a moderately large mediastinal tumor It became a troublesome

CHART I—NUMBER OF PATIENTS

Total and average survival	7	20	38	65	3 yrs. 1 mo	3 yrs. 3 mo	5 yrs 4 mo

† 6 4 and 3.5 yrs.
‡ 5.5 5 and 3 yrs. } 8 cases still survive.
§ 7 and 4 yrs.

* Cases with splenomegaly included.

more This routine is occasionally modified if other lymph node bearing areas require treatment, or when leukopenia and anemia develop Dosage has been regulated by the blood picture, size of the tumor, patient's general condition, and his reaction to treatment The hope in treating these patients with divided doses was not only to obtain relief of symptoms and regression in the size of the mass, but if possible to delay recurrence of the adenopathy in the mediastinum without causing roentgen sickness Systemic radiation in the sense of spraying the entire body was not used

Correlation of Survival Period with Distribution of Disease

The following combinations of involved regions in these sixty-five patients in order of frequency were

1 Mediastinal nodes + nodes in the neck (submaxillary, cervical, supraclavicular)
2 Mediastinal nodes + supraclavicular and axillary nodes
3 Mediastinal nodes + generalized lymphadenopathy
4 Mediastinal nodes + axillary nodes
5 Mediastinal nodes + cervical, axillary, and inguinal nodes
6 Mediastinal nodes + inguinal, femoral and/or abdominal nodes
7 Mediastinal nodes + pulmonary, pleural involvement with peripheral nodes
8 Mediastinal nodes + osseous involvement with one-two peripheral nodes

The variation in the distribution of the disease as concerning the survival period is correlated with the effect of treatment in Table I Twenty-six patients with Hodgkin's disease of the mediastinum had peripheral lymphadenopathy in one or two other regions Of these, three had no treatment, nine had inadequate treatment, and fourteen received adequate roentgentherapy There were eighteen patients in whom the disease was present in more than two regions other than the mediastinum Of these, five also had enlargement of the spleen Of the eighteen cases, one had no treatment, six had little radiation, and the remaining eleven received adequate roentgentherapy

In the final group of twenty-one cases of widely disseminated Hodgkin's disease, three had no treatment, five had inadequate treatment, and thirteen received adequate roentgentherapy We are convinced that the patients who had several different groups of nodes involved at the onset, ran a shorter course than those in whom the process was limited to the mediastinum and one or two other locations

During the course of the disease, three cases developed pulmonary and pleural extension from the mediastinum Two were treated inadequately and one received an adequate amount of roentgentherapy The average survival was a little more than one year This complication usually occurred only in the terminal stages when roentgentherapy became less effective In two other cases, we could not decide whether the disease originated in the lungs or pleura They died in thirteen and sixteen months respectively despite adequate treatment

Involvement of abdominal lymph nodes or enlargement of the spleen was not always associated with early termination in life Of the nineteen patients with abdominal lymphadenopathy, thirteen died in less than three years, four lived for four to five years, and two are still living—two to three years after the first admission

Splenomegaly (Five patients) four lived over three years and one lived over four and one-half years

Splenomegaly and enlarged liver (Three patients) The average survival was less than three years

Splenomegaly, enlarged liver, and abdominal nodes (Three patients) None lived over ten months

In general, early invasion of the bones, with or without palpable lymph node involvement, is associated with a rapid course However, in two cases with mediastinal lymphadenopathy, bone involvement appeared one and one-half and two years respectively after the first admission in one, the upper end of the sternum, and in the other, a rib was involved These were promptly and vigorously treated The sites of the lesion are now replaced by a dense new bone Both patients are alive for four-five years respectively

Common Symptoms and Their Management

The three important symptoms in

Hodgkin's disease are fever, pruritus, and loss of weight When the lesion is intrathoracic, cough, dyspnea, and pain are occasionally encountered

Fever was present in twenty per cent of the patients with the disease limited to the mediastinal nodes When more widely disseminated, it appeared more frequently, occurring in eighty-five per cent of such cases Roentgentherapy rarely affected the febrile course

Pruritus appears, in general, to depend more on the severity and extent of the disease than location In this series, pruritus occurred in only eight of seventy-seven cases, (12 5 per cent), usually considered a late manifestation associated with extensive involvement

The routine treatment of pruritus is of little value in this disease Menthol, phenol, calamine lotion, oils and creams, oatmeal and starch baths have been used with little or no success Roentgentherapy with various technics has been tried with occasional benefit. Desjardins[2] has suggested that fever and pruritus with or without toxic or infiltrative lesions in the skin indicate invasion of the abdominal nodes He infers this because the symptoms disappear after roentgentherapy over the abdomen Recently, eight patients with pruritus were treated over the abdomen and liver One felt better and had no recurrence, two were helped for a short time, and the remaining five obtained no relief

The management of loss of weight and strength in patients with Hodgkin's disease is an important problem We believe they stand radiation much better when taking a substantial and easily digested diet The inanition is, of course, due to the disease and not to roentgentherapy Many of the patients, particularly in the late stages of the illness, continue to lose weight when the disease appears to be inactive in so far as lymphadenopathy is concerned It is an error to limit therapy to the specific Hodgkin's lesions and lose sight of the patient's general well-being To persuade people without appetite to eat, is extremely difficult Dr Marks,[6] a student of nutrition and metabolism in disease, came to our help Under his supervision, patients have been given insulin to stimulate the appetite, then a diet high both in calories and vitamins The results have been most gratifying and indicate the value of this method of treatment

Cough and dyspnea were usually present when the mediastinum contained a large mass of lymph nodes Pain occurred rarely, even with a moderately large mediastinal tumor It became a troublesome

symptom only when the mass exerted pressure on the bony structures In the majority of the cases, a feeling of discomfort or fullness was the only complaint During the course of roentgentherapy over the mediastinum, the accompanying symptoms (cough, dyspnea, pain) were usually relieved with the regression of the tumor

Ten patients in this series had herpes zoster This condition was recently described by Craver and Haagensen[3] as a well-recognized complication of lymphosarcoma, Hodgkin's disease, and leukemia Wohlwill[4] (1924) studied the peripheral nervous system in ten cases of herpes zoster, six of which were idiopathic, three were associated with malignant disease, and one with syphilis His investigation suggested that herpes zoster with malignant disease may result from involvement of any section in the afferent branch of the reflex arc On the other hand, Tromner and Wohlwill[5] (1927) found no instances of herpes zoster in twelve cases of leukemia with infiltration in the nervous system The pathogenesis of secondary as well as idiopathic herpes zoster is unknown Whatever the underlying cause may be, the course of the types of this disease is very similar The herpetic lesions invariably disappear but pain usually persists for many months, and as a rule, does not respond favorably to radiotherapy Injection of the nerve roots with alcohol or excision of the sensory nerves has at times been successful in relieving the pain One patient in this series suffered excruciating pain for two months after herpetic lesions disappeared Alcohol injection into the corresponding spinal nerve root relieved the pain promptly Alcohol injection in a second patient who had pain for six months after the subsidence of herpes zoster was followed by only temporary relief Later, rhizotomy of a spinal nerve root resulted in prompt cessation of pain

Discussion

The nature of Hodgkin's disease is still in doubt Its primary clinical manifestation may appear in several locations Early involvement of mediastinal or hilar lymph nodes is not a rare occurrence

We believe that roentgentherapy is still the mainstay in the treatment of Hodgkin's disease, and that the optimum results are obtained with continuous fractionated doses given over a long period A satisfactory, well-tolerated dose over the mediastinum was found to be 50 to 100 r daily

Such a course caused complete or nearly complete regression of the mediastinal and hilar nodes In approximately fifty-five per cent of the cases, the lymph nodes never reappeared in the mediastinum In the remaining forty-five per cent of the patients, recurrence of mediastinal lymphadenopathy made necessary a second or third series of treatments

The impression should not be conveyed that all cases of Hodgkin's disease are treated alike with an inflexible routine One should always be conscious of the profound effect of irradiation on the hematopoietic system Therefore, treatment must be given cautiously and controlled by frequent blood counts If anemia or leukopenia develops or the general condition of the patient becomes unsatisfactory, irradiation should be temporarily interrupted However, this is not commonly observed where the major manifestation of the disease is in the mediastinum Treatment of uninvolved lymph node bearing areas is not indicated or advisable because of the injurious effect on the hematopoietic system

On the basis of the results in thirty-eight cases shown in the third group, it is reasonable to infer that in the majority of the patients, life was prolonged On the other hand, two of seven patients with no roentgentherapy and five of twenty with inadequate treatment lived longer than the average survival period of two-three years Therefore, it seems probable that some of the long survival cases in the adequately treated group may belong to this class of so-called benign Hodgkin's disease But that all of the thirty-eight patients who received prolonged irradiation must have fallen into this category is very unlikely

In our present state of knowledge a microscopic examination of Hodgkin's disease cannot give definite information regarding the degree of malignancy and the prognosis The assumption that all patients afflicted with this disease would live as long without as with proper roentgentherapy hardly seems justified

Summary

1 Seventy-seven cases of mediastinal Hodgkin's disease are reported In nineteen cases the mediastinal nodes alone were involved In the remaining fifty-eight cases there was, in addition to the mediastinal involvement, evidence of the disease elsewhere Generalized lymphadenopathy always appeared in the terminal stages of the disease

2 Sixty-five patients of this series have been followed Of this group, thirty-eight were considered to have received adequate irradiation The average survival period of this group is five years and four months Eight patients of this group are still alive Twenty patients had what was considered inadequate treatment Their average survival period was approximately three years and three months The remaining seven patients had no treatment The average survival period in this group was approximately three years and one month It seems that the adequately treated group had a longer survival period

3 An attempt has been made to correlate the effect of the distribution of Hodgkin's disease on survival period It is shown that the more generalized the disease, the shorter is the period of survival

4 Osseous invasion, pulmonary and pleural complications, and enlargement of the liver are associated with shorter period of survival

5 The maintenance of the patient's weight and general well-being is stressed as an important factor in prolongation of life

CHINESE MEDICINE AT THE GOLDEN GATE FAIR

Ancient Cathay's contributions to modern medicine will be one of the features to be displayed at the 1939 Golden Gate International Exposition on San Francisco Bay

In China Village, a reproduction of a walled city covering the area of a city block, the early scientific discoveries of the Chinese will be shown Early discoveries in the fields of medicine and anatomy are not the least important of these

In spite of the fact that medicine and surgery as practiced in many parts of China today have little in common with the modern sciences, the ancient Chinese made the important discovery of the circulation of the blood four thousand years ago and practiced dissection two thousand years ago

A "Canon of Medicine" or "Internal Classic" was compiled in China during the Chou Dynasty (2698–2598 B C) This book not only describes the circulation of the blood but also the various organs and their functions Dissection is also explained, and observations made as to the measurements and action of the heart, liver, lungs gall-bladder kidneys, stomach and intestines

Another display in the Exposition's China Village science show will point out the early Chinese development of a Materia Medica or Herbal Treatise, which was compiled in 2500 B C For the edification of the public the story will be told of Emperor Sheng Nug, a legendary figure of 2700 B C who, anticipating Pavlov by some 4,600 years, inserted a glass window in his abdominal wall to study the effect of various herbs on the internal organs

Among other Chinese innovations is the public board of health which was established 3000 years ago As early as the Chou Dynasty the medical department of the country was a highly organized institution Even in those early days the Chinese were on the threshold of arriving at the germ theory the use of boiled water and the boiling of leftover food was universal, and they attributed decaying teeth to microscopic worms

The science exhibit of the Exposition's China Village will be sponsored by American-born Chinese for the purpose of displaying to millions of visitors from all parts of the world the great scientific advancement of ancient China

into the skin from the positive pole in neutral or slightly alkaline solutions, and when free of electrolytic impurities For negative substances to be introduced from the negative pole, the solutions should be acid with a pH of less than three.

Naturally the electrophoretic introduction of foreign substances into the skin is followed there by chemical and physicochemical reactions, diffusion, adsorption, precipitation, absorption by cells and transportation with lymph and blood streams These conditions are beyond our control They explain the very superficial fixation of heavy metals like silver on one side and the frequency of systemic reactions with acetylcholine and the like on the other side

Of the greatest importance is the depth to which substances may be carried by electrophoresis All substances forming precipitates with proteins like heavy metals will be retained in the upper layers of the epithelial skin Vasodilators like histamine and choline compounds will be carried away by the increased circulation of the rete Malpighii and will have very little chance to penetrate locally into deeper structures The migration of other drugs may best be exemplified by methylene blue The penetration of methylene blue is most intensive when applied in seventy to eighty per cent alcoholic solution containing 1 :20 000 epinephrine The latter impedes the absorption of the dye into the circulation Under such conditions Dr Byer of our department obtained in rabbits deep staining of the epithelial skin the subcutaneous tissue and staining of the fascia of underlying muscles However, on human skin, biopsies demonstrate only a diffuse penetration of the dye through the rete Malpighii and a moderate migration along hair follicles and coil glands to subcutaneous fibers The deeper structures remain unstained even after applications of one hour duration

Electrophoresis is a local treatment Systemic effects are side-effects only, uncontrolled in dosage, and should, in my opinion be avoided, if possible However, we frequently need therapeutic effects upon deeper tissues, blood vessels, nerves, muscles—and not local skin effects Electrophoresis carries drugs in humans only into the skin Is it then without value except in skin lesions?

The skin is in many ways deeply interwoven into the functions of other tissues There are reflex connections between the circulation of the skin and the splanchnic area, the coronary circulation, the kidney circulation, between skin circulation and diuresis Bettman observed hyperemia in muscles after application of histamine to corresponding skin areas Deutsch assumes an influence of histamine upon sensory reflex connections between skin and muscles Sensory reflex connections between certain skin areas and deep tissues are well-established facts Pain produced in the diaphragm, e g, may be blocked by a novocain injection into the skin of the shoulder region

Electrophoresis is local intradermal therapy It acts directly only upon the skin proper Effects upon deeper tissues are possible with drugs controlling reflex pathways between skin and internal structures Electrophoretic applications result in better and deeper penetration of the skin than the superficial use of medicated liniments and the like It is possible to treat large areas of skin repeatedly without trauma or discomfort, appreciable advantages against intradermal or subcutaneous injections If the drug applied by electrophoresis controls deep reflex connections from the skin, aimed and localized deep effects without systemic or with only minor systemic action may be obtained, these effects being of longer duration, slower development and possibly weaker than after injection or oral application The amount of a drug introduced by electrophoresis and absorbed cannot be sufficiently controlled Electrophoresis should therefore not be used for the production of systemic results

With the above general knowledge of the possibilities of electrophoretic therapy, it will be easy to evaluate clinical results We will not be seriously concerned with successful K J electrophoresis of the neck in cases of laryngeal tuberculosis or with treatment of brain lesions by introduction of Ca from the eyeball These are only recent additions to the many older obsolete misuses of a valuable method

Vasodilator substances, chiefly histamine and mecholyl, an acetylcholine com-

ELECTROPHORETIC THERAPY

Problems and Value

KARL HARPUDER, M D, *Bronx*

Attending Physical Therapist, Montefiore Hospital and Assistant Clinical Professor in Medicine, Columbia University

Electrophoresis—also called iontophoresis or ionization—has been used extensively as a therapeutic method during the last decade It consists of the application of the galvanic current to carry into the skin or into mucous membranes, substances which would otherwise penetrate to a much lower degree or not at all The value of this procedure—although it was first tried about sixty years ago—has met with much skepticism until its therapeutic usefulness has more recently been shown with the application of histamine and of choline compounds

The increasing interest in electrophoretic applications justifies a brief general discussion of the problems involved namely in what manner electrophoretic transportation takes place, to what depth it penetrates in the treated tissues and what local or systemic effects may be expected

The introduction of substances into the skin by a galvanic current is frequently considered as a procedure identical with the migration of ions in an electrolyte solution from the pole of identical charge to the opposite one. However, Rein and others showed some twelve years ago by electrophysiological chemical, and histological investigations that the skin is a very complicated membrane which does not allow an electric current to carry ions through it like in salt solution The living epithelial part of the skin, the rete Malpighii forms a membrane with minute pores carrying negative electric charge. Water in contact with the skin takes, like on membranes of unglazed china a positive charge and migrates through the pores from the positive to the negative pole if a galvanic current is applied It carries thereby dissolved substances with positive charge—ions and molecules—through the pores This is called electrosmosis Rein demonstrated an intensive migration of methylene blue a positive dye, from the positive pole with the result of a deeply stained skin Eosin however with a negative charge, produced only a faint and very superficial staining when applied from the negative pole The ionization and the molecular diameters of both dyes are almost identical and the intensity of the carrying current was the same The difference can only be explained on the basis of electrosmotic migration Rein accomplished with a two per cent solution of cocaine hydrochloride (in eighty per cent ethyl-alcohol) a better and longer lasting skin anesthesia than with a thirty per cent solution in water, the solution being introduced from the positive pole with one ma per one sq cm for ten minutes In iontophoresis the highest possible concentration of the ion to be conducted is advantageous, for electrosmotic migration, however, less concentrated and ionized solutions are the better ones The latter may almost completely be impeded by minute electrolyte-impurities in a solution which have only little influence upon ionization The pH of a solution decreases or increases the ionization of weak acids or bases and thereby their iontophoretic migration The role of the pH for electrosmosis is entirely different. The skin carries normally or when in contact with a solution of pH 4 or more—e.g, faintly acid neutral or alkaline solutions—a negative charge and electrosmotic migration takes place from the positive to the negative pole If in contact with a solution of a pH below three—e. g, a 0 01 per cent hydrochloric acid—the human skin becomes positively charged fluid in its pores will therefore carry negative charge and migrate from the negative to the positive pole. Consequently eosin stains the skin more deeply when dissolved in N/500 HCl and applied from the negative pole.

Electrophoresis is therefore most efficient if positive substances are introduced

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester May 26, 1927

into the skin from the positive pole in neutral or slightly alkaline solutions, and when free of electrolytic impurities For negative substances to be introduced from the negative pole, the solutions should be acid with a pH of less than three

Naturally the electrophoretic introduction of foreign substances into the skin is followed there by chemical and physicochemical reactions, diffusion, adsorption, precipitation, absorption by cells and transportation with lymph and blood streams These conditions are beyond our control They explain the very superficial fixation of heavy metals like silver on one side and the frequency of systemic reactions with acetylcholine and the like on the other side

ELECTROPHORETIC THERAPY

Problems and Value

KARL HARPUDER, M D, *Bronx*

Attending Physical Therapist, Montefiore Hospital and Assistant Clinical Professor in Medicine, Columbia University

Electrophoresis—also called iontophoresis or ionization—has been used extensively as a therapeutic method during the last decade It consists of the application of the galvanic current to carry into the skin or into mucous membranes, substances which would otherwise penetrate to a much lower degree or not at all The value of this procedure—although it was first tried about sixty years ago—has met with much skepticism until its therapeutic usefulness has more recently been shown with the application of histamine and of choline compounds

The increasing interest in electrophoretic applications justifies a brief general discussion of the problems involved, namely in what manner electrophoretic transportation takes place, to what depth it penetrates in the treated tissues, and what local or systemic effects may be expected

The introduction of substances into the skin by a galvanic current is frequently considered as a procedure identical with the migration of ions in an electrolyte solution from the pole of identical charge to the opposite one However, Rein and others showed some twelve years ago by electrophysiological, chemical, and histological investigations that the skin is a very complicated membrane which does not allow an electric current to carry ions through it like in salt solution The living epithelial part of the skin, the rete Malpighii, forms a membrane with minute pores, carrying negative electric charge Water in contact with the skin takes, like on membranes of unglazed china, a positive charge and migrates through the pores from the positive to the negative pole if a galvanic current is applied It carries thereby dissolved substances with positive charge—ions and molecules—through the pores This is called electrosmosis Rein demonstrated an intensive migration of methylene blue, a positive dye, from the positive pole with the result of a deeply stained skin Eosin, however, with a negative charge, produced only a faint and very superficial staining when applied from the negative pole The ionization and the molecular diameters of both dyes are almost identical and the intensity of the carrying current was the same The difference can only be explained on the basis of electrosmotic migration Rein accomplished with a two per cent solution of cocaine hydrochloride (in eighty per cent ethyl-alcohol) a better and longer lasting skin anesthesia than with a thirty per cent solution in water, the solution being introduced from the positive pole with one ma per one sq cm for ten minutes In iontophoresis the highest possible concentration of the ion to be conducted is advantageous, for electrosmotic migration, however, less concentrated and ionized solutions are the better ones The latter may almost completely be impeded by minute electrolyte-impurities in a solution which have only little influence upon ionization The pH of a solution decreases or increases the ionization of weak acids or bases and thereby their iontophoretic migration The role of the pH for electrosmosis is entirely different The skin carries normally or when in contact with a solution of pH 4 or more—e g, faintly acid, neutral or alkaline solutions—a negative charge and electrosmotic migration takes place from the positive to the negative pole If in contact with a solution of a pH below three—e g, a 0 01 per cent hydrochloric acid—the human skin becomes positively charged, fluid in its pores will therefore carry negative charge and migrate from the negative to the positive pole Consequently, eosin stains the skin more deeply when dissolved in N/500 HCl and applied from the negative pole

Electrophoresis is therefore most efficient if positive substances are introduced

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

on the skin, which disappear spontaneously when the skin scales off, or could be removed, if necessary, by rubbing the skin with a cyanide solution

The efficiency of the silver salts as a disinfectant for the deeper layers of the skin is easily understood Silver ions, if acting over a longer period of time, are an extremely powerful disinfectant even in very high dilution An Erlenmeyer flask—e g, in which we keep a $AgNO_3$ solution for a while—may be washed afterwards with cleaning solution and ten times with water, and will still contain adsorbed on the glass-wall sufficient silver ions to prevent bacterial growth in an infected broth incubated in it for days This "oligodynamic" action is effective in dilutions of 1 10–12–16 Even with the formation of Ag-Protein in precipitates in the skin after electrophoresis, sufficient Ag ions will be available and migrating by diffusion to expect a therapeutic result

Conclusions

Electric introduction of drugs into the skin depends chiefly upon electrosmosis and in the skin is followed by biological reactions, like precipitation, diffusion, and absorption into the circulation Introduction of positive substances from the positive pole in watery, pure solutions of neutral or slightly alkaline reaction (or in alcoholic solutions) proves to be the most efficient procedure Negative substances may be introduced from the negative pole in acid solutions Electrophoresis is an intradermal therapy and deep effects can be accomplished by agents controlling reflex connections from the skin to deeper tissues There are well-defined advantages and limitations in applying electrophoresis

In addition to the commonly-used electrophoretic applications of histamine and mecholine, we found as valuable treatments (1) the electrophoretic introduction of nupercaine in painful muscular spasm with superficial tenderness or sensory changes as frequently seen in certain cases of arthritis, in neuritis and neuralgia with localized sensory changes and pain, (2) The application of $AgNO_3$ in fungous infections of the skin

245 E 207 St

Discussion

Dr. J J Levy, *Syracuse*—When iontophoresis was first introduced over thirty years ago it found many enthusiastic followers especially after Leduc's experiments on animals

One of the classical experiments of Leduc's was performed on a rabbit when he introduced strychnine by iontophoresis and within a few minutes the rabbit was seized with convulsions and died with symptoms of strychnine poisoning

Leduc's work stimulated a widespread interest in ionic medication but subsequent investigators established the fact that the moment a medicinal ion entered the body it is deprived of its charge by the electrolyte salts of the blood and lymph They showed that the beneficial results in deeper structures was due to galvanic current and not to the medicinal solution in which the electrodes were moistened

Recent clinical and experimental work with vasodilating drugs such as histamine and mecholyl showed that if drugs are forced in sufficient quantity by ionization they are absorbed into general circulation and cause profound stimulation of local circulation and also have marked systemic effects

Deutsch, in 1931, wrote several articles on the use of histamine and his striking results in myositis, muscle spasm, gave a great impetus to this form of therapy In this country Kovac has been using mecholyl in varicose ulcers and now Dr Harpuder has extended this form of therapy in treatment of athlete's foot with silver nitrate and nupercaine for the relief of referred pain or neuritic pain In other words, the use of iontophoresis is constantly being extended

I have been using histamine in private practice as well as at the University Hospital I have found it valuable in cases of acute and chronic myositis, muscle spasm and in arterial spasm, also in cases of neuritis where there is a marked disturbance of circulation

A man forty years old consulted me for pain and weakness of both lower extremities For the past three years he has had considerable pain around both ankles and in the calves He has tried all forms of physical therapy without relief Orthopedic surgeons advised strapping and arches without any benefit Being a toolmaker, he was compelled to be on his feet all day and after a day's work the pain was so great

pound of high activity, are amply used for electrophoresis, and their value is generally established The technic of these applications is well-known Histamine-electrophoresis, originally carried out with excellent results in muscular pain and spasm, is a valuable aid in the treatment of fibrositis and joint exudates, in vascular spasm and for the development of compensatory circulation, in skin ulcerations Similar indications are given for mecholyl Histamine acts directly upon skin capillaries and by an axon-reflex upon the arterioles Acetylcholine dilates first the arterioles Both produce active hyperemia of the skin with increased skin temperature of several hours' duration and seemingly with reflex dilatation of deeper vessels Mecholyl is somewhat more difficult to apply and produces easier systemic reactions than histamine These systemic effects are readily abolished by atropine

The application of cocaine or its substitutes by electrophoresis to produce anesthesia for skin surgery was suggested many years ago We use skin anesthesia for the relief of referred pain or neuralgic or neuritic pain with localized hyperesthesia and hyperalgesia of the skin The entire involved skin area is treated with a one per cent solution of nupercaine in eighty per cent alcohol containing 1 20,000 epinephrine, for twenty to thirty minutes from the positive pole at ¼–½ ma per sq cm The skin becomes pale and remains hypesthetic for several hours

Two types of cases were treated so far

Chronic Spondylitis These patients frequently develop painful spasm in the muscles along the spine or around the involved hips There is marked pain on superficial, slight pressure, and sometimes real skin hyperesthesia Of ten cases treated, seven had marked relief of pain with relaxation of the spasm after the first treatment, recovering completely, as far as the acute muscular condition was concerned, the following day without any treatment or after two to three treatments during the next days Three cases—all girls—however, did not obtain the slightest relief All these patients were first unsuccessfully treated with radiant heat, diathermy or short wave

In the second group are cases of neuritic or neuralgic pain Five cases of lasting pain after herpes zoster obtained very satisfactory results Daily treatments had to be carried out for about two weeks, then treatments every second day, and afterwards the patients were free of pain, or comfortable with slight occasional pain without treatment One of the cases is an unreliable neurotic individual The procedure just described resulted in immediate relief of several hours' duration and finally in lasting relief in a case of cervical radiculitis with sensory disturbances over the left shoulder and arm and muscular weakness with slight atrophy of the left intrinsic muscles. This patient was first unsuccessfully treated with short wave.

In true root pain, produced by metastatic lesions or by chronic spondylarthritis the results in three cases were negative, in one case of spondylarthritis relief of pain of several hours' duration was accomplished with every treatment.

The number of patients treated so far is much too small to draw any final conclusions However, the results are encouraging enough to continue with these treatments

Electrophoresis has been used a great deal for the treatment of skin lesions The application of magnesium or calcium salts, iodides and salicylates is almost obsolete Electrophoretic introduction of cocaine or its substitutes in pruritus, in allergic skin reactions, and for skin-surgery offers no definite advantages against other methods We use the electrophoretic introduction of a one per cent watery solution of silver nitrate in fungous infections of the skin, athlete's foot, and tenia cruris The application is carried out with ¼–½ ma per sq cm for fifteen to twenty minutes, from the positive pole The results are so far gratifying Most of the cases were cleared up with one treatment, a few needed two applications, one weekly In one inveterate case with an extensive eczematous reaction on both feet, unsuccessfully treated for many months with numerous applications including radiotherapy, the lesion subsided after four treatments

There frequently is increased itching for a few hours after treatment, and eventually some secretion in the crural folds or between the toes Then the itch stops and the lesion clears without further treatment within a week or so, or another treatment has to be instituted after one week Black silver patches may develop

TREATMENT OF ARTHRITIS IN HEALTH RESORTS

ROBERT MÜLLER, M D, *New York City*
From the Department of Medicine, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital

Increased interest in spas, in recent years, has led the United States to subsidize the development of health resorts This may be an appropriate time to discuss the routine of treatment in European health resorts Some of these are ancient, dating back to the Romans, and their methods have passed, with the change of medical theories, through many phases Old treatments have been discarded and new treatments have been devised Up to fifty years ago, treatments were conceived purely empirically only with the dawn of modern medicine have scientific methods been brought into balneotherapy Nevertheless, many methods still in use today are principally founded upon the natural resources of the health resorts and vary according to the properties of the springs and mud available

In choosing a treatment for arthritis patients, it should be in conformity with our present day conception of arthritis

It is generally agreed that the great majority of chronic arthritis cases can be grouped in two divisions—rheumatoid arthritis and osteoarthritis If we consider the rheumatoid arthritis group first, we are immediately faced with the general consensus of opinion[1] that "in the active stage of the disease, the most important therapeutic consideration is adequate rest." This means that, wherever possible, hospitalization of the patient for from three to six months is the most desirable measure Unfortunately, the patient can rarely be convinced of the necessity of this procedure, and, in addition, the number of hospitals, willing to take rheumatoid arthritis patients is very limited Consequently, the early stages of the disease, in which complete recovery without deformities can be hoped for, pass by without hospital care (transfusion, splints, etc) and thus the hope of a cure without deformities is lessened In my opinion, therefore, all active cases should be excluded from treatment in health resorts, as even granting that some benefit can be derived therefrom, the regular trips from the hotel to the bathing establishment, dressing and undressing before and after the treatment, would be too great a tax on the patient's strength During the active stage, a sanitarium or hospital, where the patient has no reason to leave his bed and can have all the necessary care in his own room, is by far the most desirable measure

Sooner or later, as the activity subsides, climatic resorts such as those in the warm, dry regions of Arizona, Egypt, and even those in tropical climates, are indicated During this stage, the patient may also derive some benefit from a judiciously planned balneotherapeutic course Yet our hopes for recovery must not be too optimistic and our attitude should be the same as in other chronic diseases A comparison with tuberculosis is self-evident, where every few years, a new treatment is discovered, only to be discarded again after having passed through an enthusiastic phase Only three—rest, sun, and diet—have remained unchallenged

Similarly, although more often, a new cure for rheumatoid arthritis is hailed by the medical profession, only to be limited later in its value to isolated cases Fever therapy, gold salts, sulphur, vaccine and radium have all gone through this phase Here, as in tuberculosis, enforced rest, diet, and climate, with the intention of rebuilding the patient's strength in defense against the disease, have become the most reliable and important factors The treatment in a health resort, should, therefore, not only avoid everything which will exhaust the patient, but aim to increase his resistance and vitality

The generally advertised mud cures of Europe, with their dehydration, have a definitely pain-soothing and limbering-up effect when not overdone. Unfor-

that he had to take sedatives to continue working and often had to take a day off The feet were cold and the oscillometer readings showed that there was considerable arterial spasm of the vessels of both lower extremities He has had six histamine iontophoresis treatments and he is now free from pain He is able to do a full day's work without pain for the first time in three years

In the past he has been a heavy cigarette smoker but in the last few months limits himself to a cigar and a pipe. It is possible that excessive cigarette smoking was a factor in producing his arterial spasm of the lower extremities

I am convinced that iontophoresis is the most effective therapeutic agent in myositis, muscle spasm, and arterial spasm

In conclusion I want to congratulate Dr Harpuder on his scientific work and I am going to use nupercaine and silver nitrate in those conditions that have responded so well to this form of therapy

NEGLECT OF BEDSIDE MEDICINE

If medical students are to become good practitioners they must get away from the 'prolonged emphasis" on scientific medicine and cultivate the powers of bedside observation of the patient, according to Dr Harvey Cushing

Dr Cushing, who has been connected with both the Harvard and Yale Medical Schools, spoke at the eighteenth annual meeting of the Association for Research in Nervous and Mental Disease at the Hotel Waldorf-Astoria His theme, in a sense, he said, was "Back to Hippocrates," and he related that twelve years ago at Yale he proposed that medicine be taught in terms of the patient from the outset instead of only in the last two years

"Such inroads on the student's time have been made in these later days by the prolonged emphasis on subjects of which few are capable of taking advantage—subjects like as not, taught by doctors of philosophy rather than of medicine—that when the student has finally reached the few short semesters he will spend in the clinic, the exposure, examination and observation of the patient finds him so ill at ease he glosses over these procedures," Dr Cushing said

"His natural reaction is to sit back and to await returns from laboratory technicians who may never have seen the patient but have learned how to make the necessary calculations on a slide rule from pieces of apparatus they alone can operate

"A great deal of this is, of course, nothing other than psuedo-science, the possibilities of error plus or minus in milligrams per cent being large, and the findings most difficult of interpretation even did they happen to be checked and found to be correct."

The modern physician, as a result, Dr Cushing said, "to the mystification of his patient, by the aid of complicated tables," determines his blood reaction and calculates "to the third decimal how fast he is burning up or cooling off"

Dr Cushing told how Columbus did not know where he was going when he sailed westward, where he was when he found land or where he had been when he returned "And a good deal of our reputedly scientific medicine is no less vague," he added The only answer medical research could give to its sponsors, he said, was that "we may possibly hit upon some island of fact hitherto unrecorded"

"Though expensive, there is no objection whatever to this program," he added, "provided we don't neglect meanwhile our primary duty—the day by day solicitous bedside observation and care of our patient."

PRIZE ESSAYS

The Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York This is for One Hundred Dollars for the best original contribution on some branch of Surgery, preferably Ophthalmology

The author need not be a member of the State Medical Society

The following conditions must be observed

Essays shall be typewritten or printed and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of the prize, it will not be awarded

All essays must be presented not later than April 1, and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 2 E. 103 St, New York City

FRANK B CROSS *Chairman*
Committee on Prize Essays

TREATMENT OF ARTHRITIS IN HEALTH RESORTS

ROBERT MULLER, M D, *New York City*
From the Department of Medicine, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital

Increased interest in spas, in recent years, has led the United States to subsidize the development of health resorts This may be an appropriate time to discuss the routine of treatment in European health resorts Some of these are ancient, dating back to the Romans, and their methods have passed, with the change of medical theories, through many phases Old treatments have been discarded and new treatments have been devised Up to fifty years ago, treatments were conceived purely empirically only with the dawn of modern medicine have scientific methods been brought into balneotherapy Nevertheless, many methods still in use today are principally founded upon the natural resources of the health resorts and vary according to the properties of the springs and mud available

In choosing a treatment for arthritis patients, it should be in conformity with our present day conception of arthritis

It is generally agreed that the great majority of chronic arthritis cases can be grouped in two divisions—rheumatoid arthritis and osteoarthritis If we consider the rheumatoid arthritis group first, we are immediately faced with the general consensus of opinion[1] that "in the active stage of the disease, the most important therapeutic consideration is adequate rest" This means that, wherever possible, hospitalization of the patient for from three to six months is the most desirable measure. Unfortunately, the patient can rarely be convinced of the necessity of this procedure, and, in addition, the number of hospitals, willing to take rheumatoid arthritis patients is very limited Consequently, the early stages of the disease, in which complete recovery without deformities can be hoped for, pass by without hospital care (transfusion, splints, etc) and thus the hope of a cure without deformities is lessened In my opinion, therefore, all active cases should be excluded from treatment in health resorts, as even granting that some benefit can be derived therefrom, the regular trips from the hotel to the bathing establishment, dressing and undressing before and after the treatment, would be too great a tax on the patient's strength During the active stage, a sanitarium or hospital, where the patient has no reason to leave his bed and can have all the necessary care in his own room, is by far the most desirable measure

Sooner or later, as the activity subsides, climatic resorts such as those in the warm, dry regions of Arizona, Egypt, and even those in tropical climates, are indicated During this stage, the patient may also derive some benefit from a judiciously planned balneotherapeutic course Yet our hopes for recovery must not be too optimistic and our attitude should be the same as in other chronic diseases A comparison with tuberculosis is self-evident, where every few years, a new treatment is discovered, only to be discarded again after having passed through an enthusiastic phase Only three—rest, sun, and diet—have remained unchallenged

Similarly, although more often, a new cure for rheumatoid arthritis is hailed by the medical profession, only to be limited later in its value to isolated cases Fever therapy, gold salts, sulphur, vaccine and radium have all gone through this phase Here, as in tuberculosis, enforced rest, diet, and climate, with the intention of rebuilding the patient's strength in defense against the disease, have become the most reliable and important factors The treatment in a health resort, should, therefore, not only avoid everything which will exhaust the patient but aim to increase his resistance and vitality

The generally advertised mud cures of Europe, with their dehydration, have a definitely pain-soothing and limbering-up effect when not overdone. Unfor-

tunately, there is a tendency on the part of the patient to overestimate their value Having taken his mud bath, the patient feels that he has done his duty for the day and can now enjoy the normal life which the other patients lead in a health resort, so, after an hour's rest, he takes a ride or a walk in the afternoon, and even stays up late at night Such transgressions would naturally reverse the benefit of the cure and make the patient worse than he was at the onset

When "taking a cure" in a health resort, the maximum time out of bed allowed a patient suffering from nonactive rheumatoid arthritis should be four hours and in that time a bath or pack and half an hour's exercise under expert supervision should be given, so that the patient goes through a complete range of motion of all joints at least once a day

Besides supplying the treatment for his arthritis, many health resorts are excellently equipped to treat infections of the upper respiratory and gastrointestinal tract. With this we again come back to our original treatment plan, which is to try and rebuild the patient in general, by paying special attention to his other ailments These, although they may not necessarily be foci of infection, may hamper his general recovery

The success of a balneotherapeutic course in a spa for rheumatoid arthritic patients depends, therefore, in my opinion, not so much upon the quality of the mud, the duration and temperature of the baths, but upon the general outline of the cure to improve the condition of the patient by remedying his malnutrition, anemia, nervousness, etc The physician's duty is to regulate the patient's general life, to try and relieve other ailments, should they be present, and to instill new hope in the patient If these directions are observed, the pleasant surroundings of a health resort and the regularity of the treatments will go a long way to help these unfortunate patients towards recovery The objective improvement—diminished swelling of the joints, lowering of the sedimentation rate, which Dawson, Sia and Boots[2] regard as the gage for the severity of the infection—corresponds to the lessening of pain, improved sleep, and more cheerful attitude

The second group of patients with chronic arthritis, the osteoarthritis, is far more suitable for treatment in a health resort This group is composed of older people, most of them overweight, who have gradually developed pains in their weight-bearing joints To mention the most frequently afflicted parts, the metatarsophalangeal joint of the big toe, both knee joints, which are more frequently affected in women, the hip, where the disease is known as malum coxae senile, the lower back, where a combination of arthritic, mechanical, and traumatic conditions are collectively referred to as "sacroiliac," comprising under this name everything from simple lumbago to advanced arthritis with spondylolisthesis and other deformities In the dorsal spine, a kyphoscoliosis, often dating back to infancy and unnoticed by the patient in earlier life, is the cause of painful episodes in later years The same is true of osteoarthritis of the neck which often is the result of postural abnormalties

More or less successful attempts have been made to treat these conditions at home, but the impossibility of losing twenty or thirty pounds, added to the fact, that the daily routine makes it difficult to save joints from further abuse, have failed to bring about really satisfactory results

Taking a cure at a resort means that, *first of all,* they are put on a diet This is more easily observed than at home, since everyone around them is on some diet In addition, practically all spas make use of waters with a laxative effect, which also help the patient to lose the weight he failed to lose at home Diminished weight is one of the most important points in saving weight-bearing joints

Another important factor, used extensively in health resorts and recognized as an excellent remedy for this condition, is heat combined with massage Heat is applied in the form of local or general treatments Every health resort uses its particular method Hot towels is the method at Saratoga, Italian resorts use fango, a volcanic mud, so does Pistyan in Czechoslovakia, while the other Czechoslovakian spas—Carlsbad, Marienbad, Francensbad—and most of the German use mud from mineral moors

This latter mud, owing to its liquid consistency, is used chiefly in the form of local and general baths, while the volcanic form, being of a thicker, butter-like nature, is used for packs and local applications In conjunction with this, new methods of electrotherapy—short-wave, histamine iontophoresis, etc—are extensively used By means of these treatments, the patient may lose all or most of his pains and discomforts, yet as may be expected, the findings in the x-rays will not be different after the treatment The bony changes cannot be reversed Often very striking increase in the mobility, disappearance of crepitation and pain are brought about by the treatment. These improvements are due to the relieving of periosteal and synovial irritations of mechanico-traumatic nature [3]

In osteoarthritis, a disease which shows great fluctuations of the symptoms, far advanced lesions in the x-rays are compatible with comparative comfort. Even the advanced age of the patient should not make the outlook too dark The natural history of the disease shows that minor injuries due to sprains or unabsorbed blood clots lead to acute exacerbations These can be followed by long periods—even years—of relative freedom from symptoms The treatment should endeavor to bring about this stage of quiescence, by removing muscle spasm and improving the circulation of the affected joint

As principally the weight-bearing joints are affected, walking, which is fundamentally an exercise with weight on the joints, should be reduced to the lowest possible limit. Yet, as herein mentioned, the question of losing weight is an essential part of the treatment Recognizing this fact, the European health resorts have built elaborate gymnasiums, mostly equipped with Zander machines, although lately other methods of physical culture have been introduced By both methods, the patient can spend daily one to two hours exercising, without ever putting undesirable strain on his joints

Though originally intended for cases of poliomyelitis, swimming pools, with a staff of trained assistants, are replacing these gymnasiums in American health resorts Excellent results in osteoarthritis have been reported with this method of treatment.

Although not necessarily affecting weight-bearing joints, yet, in many ways, resembling these conditions, are the later stages of gonococcal arthritis The great tendency of this disease to form adhesions can be successfully combated by the above-mentioned treatment

Patients suffering from bursitis, with all its complications—stiffening, periarthritis, etc—can regain complete range of motion by a systematically carried-out program of heat and exercise

It is customary for the patient to receive one of the hot applications directly after the exercising The perspiration induced by this procedure is kept up for one or two hours by wrapping the patient in woolen blankets This enforced rest is not so unusual to the Central European, who takes his big meal at midday and usually finds time for an hour's rest afterwards To the harassed American business man, who has never had time for such a luxury, this enforced rest after exercise and bath is especially beneficial and enjoyable Not only if he suffers from osteoarthritis of the spine, where the muscles refusing to carry the burden, have rebelled with lumbago, fibrositis of the neck, brachial neuritis, and sciatica, is this indicated, but also where the heart and blood pressure have shown the wear and tear of age and overwork This temporary change in the daily routine is certainly an essential part of the cure and, in my opinion, can claim credit for a great deal of the benefit which lasts for many months

Conclusions

1 Health resorts are very suitable for treatment of osteoarthritis patients If the affected joints are protected and treated simultaneously, long periods of quiescence can be obtained

2 Old age and far-advanced deformity of a joint do not preclude years of relative comfort.

3 Patients with rheumatoid arthritis in the acute stage should be hospitalized They are not suitable for a cure in a health resort in the usual sense

4 Patients in the nonactive stage should have a very mild form of treat-

difficulty was experienced in bringing the head to the extreme left and the chin to the right, and at this time no visible shortening of either sternal or clavicular heads, nor of the platysma myoides was noted.

The exact etiology of the postural defect was not determined, but operative intervention seemed definitely contraindicated and a leather collar was therefore applied to fix the head in the overcorrected position

This fixation, applied for eight months, was followed by increasing ocular complaints by the child, so that she was referred to the ophthalmological department, where Dr James A Smith noted "The diagnosis is paresis of the right superior rectus muscle The secondary spasm of the left inferior oblique muscle, and the diplopia resulting therefrom, may account for the tilt of the head to the right Tenotomy of the left inferior oblique muscle is indicated"

This procedure was performed by Dr Smith in November 1935 Improvement in the head tilt was noted almost immediately and one month postoperatively, complete correction, without any type of fixation

There has been no recurrence of the deformity one and one-half years postoperatively (Fig 2)

HOW TO PREVENT THE FLU

I notice that the papers say
That milk will keep the 'flu at bay,
And he who swigs his pint (or quart?)
Will ail from nothing of that sort.
And I have also heard it said
That influenza microbes dread
Swipes that are much less mild than that—
For there are those who tell you flat,
And with an emphasis terrific,
That whisky is the grand specific.
Others assert, and to it stick,
That orange juice will do the trick,
And obviously it must be true
That vitamins prevent the 'flu,
For vitamins both should and can
Thwart every ailment known to man
The calorie in this connection
No doubt affords secure protection.
Fresh fruit is also recommended,
And artificial sunlight splendid,
And when you've taken all the rest,
It may be true that beer is best.

There should also be borne in mind
The various bottles that we find
Displayed within the chemist's shop
For keeping 'flu germs on the hop
Tonics there are to keep you fit,
No bug would dare to do its bit

Against a human braced with those
To meet the worst of 'flu germ foes
Or, if some bug should dare to bite
Before you've got your system right,
Are there not dopes designed as cures
Before the full attack matures?

How odd it seems, with all these aids,
That 'flu still makes its frequent raids!
Cures and preventives all around—
And yet we still see people downed!
Bearing in mind how mortals might
(As just explained) avoid this blight,
Strange is the truth, as here we strike it—
They must have 'flu because they like it!

—*Manchester Guardian*

ANOTHER BLOW TO JEWISH DOCTORS

A dispatch from Berlin reports that all Jewish doctors and dentists are excluded as of Jan 1 from "panel" practice under the Compulsory Insurance Law As ordinary medical practice in Germany is almost entirely paid for by the government insurance association, the great majority of Jewish physicians and dentists will suffer a heavy loss

Some 800 Jewish doctors and dentists in Berlin are reported to be engaged, at least in part, in such panel practice. Various restrictions have been laid on them, but they have still been able to treat patients under the Compulsory Insurance Law

The ruling, of course, does not seriously affect well-known specialists, but makes practice almost out of the question for most Jewish physicians

ment, the cure especially outlined to increase their strength by enforced rest and diet and attention given to their general condition

OCULAR OR PSEUDOTORTICOLLIS

M THOMAS HORWITZ, M D, *Philadelphia, Pa*
From the Orthopedic service of Dr S A Jahss, Hospital for Joint Diseases, New York City

Previous reports[1-4] on this condition have in the main been directed to the ophthalmological literature We feel the necessity of emphasizing its recognition to the general practitioner as well as the orthopedic surgeon, who are most apt to see these cases initially

Normal binocular single vision depends largely on the coordination of the extraocular muscles It is lost when the visual axis of one eye deviates, as in paralysis of any of these muscles, and binocular diplopia results

Ocular or pseudotorticollis is the compensatory adjustment of the head to overcome vertical diplopia due to paralysis of the superior or inferior recti or oblique muscles Internal or external rectus muscle paralysis causes no tilt, but either a deviation of the head towards the field in which the paralyzed muscle acts or the eye may deviate into a squint

It is differentiated from true wry-neck by the absence of contracture of the sternocleidomastoid muscle, by the absence of early facial asymmetry, and by the facile correction of the head tilt, actively or passively

Correction of the ocular defect by a competent ophthalmologist is at the same time the cure of the torticollis and the prophylaxis against secondary changes in the cervical musculature and spine. The procedure is to produce a defect in motility in the *sound* eye, which will be similar to the defect in the *paralyzed* eye, so that equilibrium is restored to both eyes

Orthopedic measures and exercises may be necessary adjuncts to correct secondary changes

Case Report

M W, a female, was seen in the outpatient department, at the age of twenty-two months, because of a persistent tilt of the head to the right, present since the age of one year Diagnosed as a congenital torticollis due to contracture of the right sternocleidomastoideus, she was treated with diathermia, massage, and the use of a sausage-collar, for more than a year, without alteration of the deformity

In February 1935, admission to the hospital was advised for a tenotomy of the contracted cervical muscles

A more careful examination at this time revealed that the child held her head tilted to the right, chin pointing to the left (Fig 1), but that neither asymmetry of the face nor inequality of the palpebral fissures existed She could voluntarily correct the tilted position of the head Passively, no

Fig 2. 1½ years postoperatively

some particular branch of the hematopoietic system Of the agents under consideration, x-ray and radium exert their chief detrimental effect on the hematopoietic function of the lymph glands, and to a lesser degree on the myeloid system Lead is primarily harmful to the erythropoietic system, and benzol to the myeloid system With regard to benzol, other systems are almost always involved within a shorter or longer period of time, depending upon the sensitivity to benzol of the particular individual There are persons so susceptible to this poison that the entire hematopoietic system is affected at once, thus explaining the hematopoietic as of other occupational diseases

X-ray and Radium

Our knowledge of the deleterious effect of x-ray and radium on the body in general and the blood in particular is of comparatively recent origin Mottram[1] has shown by animal experimentation that lymphoid tissues are more affected by the roentgen ray than bone-marrow At first there is a relative and then an absolute increase in lymphocytes accompanied by a decrease in polymorphonuclears Leukopenia may accompany the lymphocytosis, but is not constant or reliable as a criterion of overdosage The hemoglobin and red blood cells are not altered Stray radium gamma is more penetrating than x-rays and causes more marked local reactions but less disturbance in the blood According to Levin[2] the larger the square area of entry of x-rays into the organism, the more severe is the general effect on the blood

TABLE I—IMPORTANT INDUSTRIAL AGENTS PRODUCING BLOOD DYSCRASIAS

Agent	*Special affinity*	*Type of primary action*	*Primary action*	*Secondary (and later) effects on other parts of the hematopoietic system*
Benzol (Benzene not benzine)	Leukoblastic tissue in bone marrow	Depressive, destructive	Leukopenia (polys)	Thrombocytopenia causes bleeding Bleeding leads to secondary anemia
Radium	Lymphocytes in hemolymph glands	Stimulating	Lymphocytosis	Bone marrow r b c. first, w b c. later
X ray	Affinity and action same as radium, but milder			
Lead	Erythropoietic tissue in bone marrow	Depressant and regenerative	Secondary anemia	No tendency to affect other hematopoietic elements, as a rule

Technicians who use x-ray or radium and develop hemotologic symptoms do so in a chronic, progressive manner The first evidence of an adverse effect is in general systemic disturbances Malaise, loss of appetite, ready fatigue, and a peculiar greenish pallor become noticeable But when the blood is examined in this early stage there is surprisingly little reduction in the red blood cells numerically, and no change in their size or shape, indicating that the erythropoietic system has not become disturbed The white blood cells, however, show a disproportion between the granulocytes and lymphocytes The percentage of lymphocytes may be forty per cent, fifty per cent, even seventy per cent, their

acute agranulocytopenia occasionally encountered in benzol poisoning

Authors do not agree generally as to the clinical manifestations of blood dyscrasias caused by the different chemical agents considered in this discussion This is due to (1) the difference in the resistance of the individual to the particular chemical agent, (2) to the length of time the individual is exposed, and (3) the progressive action of certain chemical poisons, particularly benzol which continues to act long after cessation of exposure to the poison (Table I)

Realizing the importance of all these factors and believing that the time is ripe for a review of the many phases of blood dyscrasias caused by certain physical and chemical agents, we present a clinical picture in some detail of the blood disturbances caused by x-ray, radium, lead, and benzol The requirement of a reasonable lapse of time between the beginning of employment and the development of disease in an employee in order that an occupational disease may be considered compensable is true of

BLOOD DYSCRASIAS CAUSED BY OCCUPATION

With Specific Reference to the Effect of X-ray, Radium, Lead, and Benzol

I W Held, M D and A Lieberson, M D, *New York City*
Attending Physician, Beth Israel Hospital, Clinical Professor of Medicine, N Y University Medical College (I W H)—Adjunct Physician, Beth Israel Hospital

In an age of increasing social mindedness, evidenced by the enactment of a growing number of laws not only to protect the worker's health but to compensate him for injury sustained in the course of his employment, it is important for the general practitioner to be familiar with the causative relationship between disease and certain occupations

Although blood dyscrasias do not rank high in frequency among occupational affections, nevertheless they occur sufficiently often to warrant more than the scant attention given them not only in textbooks on industrial medicine but in medical literature generally It is not the frequency or rarity with which a particular disease occurs that is the all-important factor in industrial medicine, that it may develop at all is the essential point Therefore familiarity with the blood dyscrasias as they occur in certain industries may be as vital to the welfare of an employee in one of those fields as our knowledge of silicosis is in the stonecutter industry

Animal experimentation has shown that chemicals like x-ray, radium, lead, and benzol are very poisonous to the hematopoietic system If a human being should inhale or take by mouth any of these chemicals, poisonous symptoms even resulting in fatalities occur One must therefore seek an explanation why the same chemicals are not equally injurious to all people working in any particular industry The hematopoietic system is only rarely affected, even in individuals where the respective poisons affect other organs in the body

One factor in this rarity is the relatively infrequent occurrence of spontaneous hematopoietic disease in comparison with the incidence of other diseases to which the human being is subject. There seems to be a protective mechanism in the hematopoietic system for the maintenance of the cellular elements of the blood qualitatively at a normal level Even when definite pathologic changes are present in some part of the hematopoietic system as in diffuse metastatic carcinoma of the bones, or multiple myeloma, there is little if any evidence in the peripheral blood of disturbance in the myeloid system Quantitative changes in the cellular elements, particularly of the white cells, are rather the rule

In the spontaneous blood dyscrasias of unknown origin, there is generally no period of functional disturbance which would serve to point out the beginning development of hematopoietic disease. Pernicious anemia, for instance, is not ushered in by a warning period of reduction in the number of the red blood cells, or alteration in the quality of these cells Once the spontaneous organic hematopoietic disease sets in, however, although only one part of the hematopoietic system is affected at first, all other branches are soon involved In myeloid leukemia, for example, there is a primary invasion of the myeloid system which is followed within a short time by changes in the lymphocytic and erythropoietic systems

In the occupational blood dyscrasias, the course of the disease is different There is as a rule a long period of functional disturbance of only one branch of the hematopoietic system In many instances the disease is reversible (if recognized early) through removal of the causative agent and institution of adequate treatment

Another difference between spontaneous and occupational blood dyscrasias is the much longer period of time that elapses in the latter form between involvement of one part of the hematopoietic system and invasion of other parts This is due to the predilection of certain physical and chemical agents for

plified by two to three gm of calcium gluconate four or five times daily by mouth This is followed by a calcium-free period of two to three weeks Prophylaxis is of the utmost importance, and workers should protect themselves from inhalation by proper ventilation and the wearing of suitable masks Should symptoms develop in spite of precautions, the patient should immediately withdraw from this occupation

Benzol

We come now to the substance which industrially is likely to cause the most severe and dangerous blood dyscrasias Benzol is employed wherever rubber is used—tires, raincoats, etc It enters into many dyes, polishes, and cleaners Santesson[10] as early as 1897 wrote a clinical paper warning against the deleterious effects of benzol He described nine cases of purpura hemorrhagica in girls who used benzol rubber cement in their work, four of which were fatal In 1910 Selling[11] reported three similar cases in workers engaged in sealing tin cans with benzol rubber Selling then carried out extensive animal experimentation which indicated that the main characteristic of benzol poisoning is not purpura hemorrhagica but an extreme leukopenia He showed that benzol is a powerful leukotoxic substance destroying white cells in the area of production and in the circulating blood, eventually affecting the hematopoietic activity of the spleen and other lymph glands The myeloid tissue suffers the earliest and greatest damage, the erythroblastic and megakaryocytic elements being only secondarily affected The observations of Selling were confirmed by many workers, notably by Schiff[12] who further found that benzol has a detrimental effect on antibody activity, so that workers in the benzol trades who develop an infection are prone to succumb

Credit for demonstrating more recently the chronic damage produced by benzol and its manner of action should go to Alice Hamilton[13] of Harvard University for her thorough animal experimentation She demonstrated that two or three days after the first injection of a sizeable dose of benzol, the animal showed a reduction of white blood cells up to fifty-two per cent, and two or three days after the next injection a reduction to twenty per cent, or even as low as twelve per cent When she stopped after the first injection, the fall in white blood cells continued, but later there was spontaneous recovery However, when the second injection was given and the fall in white blood cells dropped below twelve per cent, there was no recovery In these animals definite disturbances in the bone-marrow alone were found, especially the myeloblastic tissues, but there was very little change in the hemolymph glands, spleen, liver, etc, differing in this respect from x-ray and radium The leukocytic elements, particularly the polymorphonuclears, were reduced There was no destruction of white blood cells in the circulating blood, but an inhibition of their formation, causing a leukopenia at the expense of the polymorphonuclears In clinical cases of blood dyscrasias caused by benzol the blood findings are very similar to these animal experiments

Symptomatology

Although acute benzol poisoning rarely occurs as an occupational development, it is nevertheless emphasized that there is a marked difference between acute and chronic benzol poisoning In the acute state, benzol exerts its detrimental effect primarily by inhalation There are marked respiratory and nervous symptoms—convulsions, persistent cough, dyspnea, orthopnea, and cyanosis The peripheral blood findings are entirely negative After death, which occurs within twenty-four to forty-eight hours, the blood remains in a liquid state

Acute benzol poisoning, like chronic, is seen most often in women, particularly young women, it is possible that the extensive use of cheap cosmetics may be a factor in undermining the young worker's hematopoietic system through the presence of harmful dyes, making her more susceptible to benzol poisoning

Occupational benzol poisoning as a rule requires a year or more for the development of sufficient symptoms to make the employee feel he cannot attend to his work The first symptoms are ma-

character is that of the mature cell As the condition progresses the spleen and the peripheral glands enlarge, and blood changes may occur typical of lymphatic leukemia The blood platelets are reduced, the red blood cells diminished, myeloblasts and myelocytes appear in the blood In rare cases *myeloid leukemia* develops [3 5]

Treatment

If the patient is removed from his occupation at the beginning of his systemic disturbance and is kept away from the deleterious influence of x-ray and radium, the blood dyscrasia may be reversible and he may fully recover from it The anemia is treated with large doses of iron and occasional blood transfusions Fresh air and nourishing diet are essential throughout the course of the treatment Complete removal of the patient from x-ray and radium cannot be overemphasized, for if this precaution is not taken, leukemia with marked increase in abnormal lymphocytes develops At this stage, remarkably enough, the judicious employment of x-ray therapy may prolong life as in ordinary idiopathic lymphatic leukemia

Lead

The effect of lead may be expressed chiefly in disturbances of the brain (lead *encephalopathy*), *peripheral nerves* (lead palsy), sensory nerves (lead neuritis), or gastrointestinal tract (lead colic) Very often cases are encountered involving the vascular system with hypertension, renal vascular changes, or even true nephrosis More rarely all systems are affected Lead anemia, when it does occur, is almost always associated with signs of lead poisoning in some other organs, as indicated above

Changes in the erythropoietic system of a quantitative nature are relatively infrequent The hematopoietic system is seldom so affected as to lead to fatal termination, so that scant attention was paid to its development for a long time. It was recognized of course that anemia is a feature, and that some stippling of the red blood cells is present In 1924 Key,[6] working in Aub's laboratory, showed that in proportion to the degree with which lead phosphate forms in the bone, red blood cells undergo striking changes The surface of the red blood cell becomes hard, brittle, and also sticky, interfering with agglutination As these brittle cells circulate through the capillaries they break up and bring *about an anemia almost pernicious in* character Eventually the loss of these cells stimulates the hematopoietic tissues so that immature cells appear in the blood, explaining the findings of poikilocytosis, anisocytosis, polychromatophilia and basophilic stippling There is no change in blood platelets since the myeloid system is not affected, and no hemorrhagic diathesis

Lead is utilized in more than 150 industries Chief among these are lead smelting, producing white lead oxides for paints, mixing pastes, pasting plates, finishing plates for storage batteries, glazing pottery, compounding rubber, manufacturing lithographic paper, drinking utensils, toys, and many other articles [7] It was Tanquerill des Planches[8] who discovered that lead poisoning is caused only by inhalation of the dust Duckering[9] has shown that if no more than two mg of lead is inhaled in an eight hour work day lead poisoning does not develop, but if the amount is increased from two to five mg the symptoms of lead poisoning will develop After the lead is absorbed it is carried in the blood as dibasic phosphate and deposited in the skeleton as tribasic phosphate, chiefly in the bone trabeculae but also in the cortex Ninety-five per cent of the lead in chronic lead poisoning is in the skeleton Excretion *in the urine and in the stool* is very gradual An alcoholic debauch or an acute infection may precede an acute attack of plumbism in lead workers

Treatment

The earliest treatment for lead poisoning was potassium iodide as an alterative and belladonna as an antispasmodic. The more modern treatment calls for alternating periods of high and low calcium intake to foster the mobilization and excretion of the combined calcium-lead salts During the first period, a high calcium intake is provided for three to four weeks by a milk and fruit diet am-

plified by two to three gm of calcium gluconate four or five times daily by mouth This is followed by a calcium-free period of two to three weeks Prophylaxis is of the utmost importance, and workers should protect themselves from inhalation by proper ventilation and the wearing of suitable masks Should symptoms develop in spite of precautions, the patient should immediately withdraw from this occupation

Benzol

We come now to the substance which industrially is likely to cause the most severe and dangerous blood dyscrasias Benzol is employed wherever rubber is used—tires, raincoats, etc It enters into many dyes, polishes, and cleaners Santesson[10] as early as 1897 wrote a clinical paper warning against the deleterious effects of benzol He described nine cases of purpura hemorrhagica in girls who used benzol rubber cement in their work, four of which were fatal In 1910 Selling[11] reported three similar cases in workers engaged in sealing tin cans with benzol rubber Selling then carried out extensive animal experimentation which indicated that the main characteristic of benzol poisoning is not purpura hemorrhagica but an extreme leukopenia. He showed that benzol is a powerful leukotoxic substance destroying white cells in the area of production and in the circulating blood, eventually affecting the hematopoietic activity of the spleen and other lymph glands The myeloid tissue suffers the earliest and greatest damage, the erythroblastic and megakaryocytic elements being only secondarily affected The observations of Selling were confirmed by many workers, notably by Schiff[12] who further found that benzol has a detrimental effect on antibody activity, so that workers in the benzol trades who develop an infection are prone to succumb

Credit for demonstrating more recently the chronic damage produced by benzol and its manner of action should go to Alice Hamilton[13] of Harvard University for her thorough animal experimentation She demonstrated that two or three days after the first injection of a sizeable dose of benzol, the animal showed a reduction of white blood cells up to fifty-two per cent, and two or three days after the next injection a reduction to twenty per cent, or even as low as twelve per cent When she stopped after the first injection, the fall in white blood cells continued, but later there was spontaneous recovery However, when the second injection was given and the fall in white blood cells dropped below twelve per cent, there was no recovery In these animals definite disturbances in the bone-marrow alone were found, especially the myeloblastic tissues, but there was very little change in the hemolymph glands, spleen, liver, etc, differing in this respect from x-ray and radium The leukocytic elements, particularly the polymorphonuclears, were reduced There was no destruction of white blood cells in the circulating blood, but an inhibition of their formation, causing a leukopenia at the expense of the polymorphonuclears In clinical cases of blood dyscrasias caused by benzol the blood findings are very similar to these animal experiments

Symptomatology

Although acute benzol poisoning rarely occurs as an occupational development, it is nevertheless emphasized that there is a marked difference between acute and chronic benzol poisoning In the acute state, benzol exerts its detrimental effect primarily by inhalation There are marked respiratory and nervous symptoms—convulsions, persistent cough, dyspnea, orthopnea, and cyanosis The peripheral blood findings are entirely negative After death, which occurs within twenty-four to forty-eight hours, the blood remains in a liquid state

Acute benzol poisoning, like chronic, is seen most often in women, particularly young women, it is possible that the extensive use of cheap cosmetics may be a factor in undermining the young worker's hematopoietic system through the presence of harmful dyes, making her more susceptible to benzol poisoning

Occupational benzol poisoning as a rule requires a year or more for the development of sufficient symptoms to make the employee feel he cannot attend to his work The first symptoms are ma-

laise, pallor, easy fatiguability, and loss of appetite It is of the greatest importance to examine the blood as soon as symptoms of this kind appear in a worker in a benzol trade There is moderate neutropenia, but no change in the red blood cells and no reduction in hemoglobin at this stage In many cases an increase in blood platelets begins to make its appearance, to be followed later by a decrease [14] An individual with these blood findings should not be allowed to continue working with benzol, for if he is removed from this menace at this stage, he will recover rapidly

If employment is not discontinued, the leukotoxic effect of benzol goes on until eventually there is reduction in the polymorphonuclear cells There may be only 1000 or 2000 white blood cells with a polymorphonuclear count of twenty per cent to forty per cent, or even as low as ten per cent Immature cells (one to two per cent myeloblasts) are frequently seen in the blood The reduction of blood platelets keeps pace with the fall in the white blood cells, both quantitatively and qualitatively There are external manifestations of hemorrhagic diathesis—bleeding from the gums, nose, pharynx, uterus, and even gastrointestinal tract

During this period the patient presents a picture of malignant thrombocytopenia, a mistaken diagnosis of essential thrombocytopenia is easily made

The erythroblastic system is not affected qualitatively but quantitatively, secondary to the loss of blood Evidence of the regeneration of red blood cells, such as the presence of reticulocytes or nucleated red blood cells is not present If the correct diagnosis is made, even at this stage of the disease, repeated transfusions may improve the patient, and in some instances may even lead to recovery

Instead of the typical clinical picture in benzol poisoning outlined above, there may be variations Polynucleosis may be present instead of leukopenia, especially if there is a focus of suppuration anywhere in the body Even in animal experiments if an infection is caused by injecting bacteria in addition to benzol, leukocytosis results, instead of leukopenia Under normal conditions the red blood cells are reduced only in number Abnormalities however, are not unknown to occur in size, shape and staining properties Stippling of the red blood cells, reticulocytes and even nucleated red blood cells, as well as a high color index, have been reported Cabot[15] has shown regenerative forms of red blood cells such as are seen in pernicious anemia

Alice Hamilton[18] has called attention to two features that are particularly the source of much difficulty in diagnosis One is the great variation in susceptibility of individuals, exemplified by cases of severe fatal poisoning in a factory where other employees show no symptoms of poisoning The other is the progressive, cumulative action of the poison after exposure has ceased Once injury to the bone marrow is sufficiently extensive, the process progresses even when there is no further contact with the chemical Four of Santesson's nine girl patients,[10] for instance, developed serious symptoms only after they had left the factory where the contact occurred Rohner[10] described a man who left the factory where he worked merely because the fumes of benzol irritated his eyes, and soon afterwards developed fatal aplastic anemia

The general considerations outlined above for benzol apply also to its numerous derivatives in industry, such as high-flash naphtha (a solvent composed of toluene and xylene) These substances are of the same type but are weaker leukotoxic agents than benzol itself, as Batchelor[17] has shown The nitroso and amido groups of benzol derivatives, on the other hand, are more toxic to the blood than benzol itself Their deleterious action is primarily the production of anoxemia by formation of methemoglobin with typical symptoms of methemoglobinemia—flushing of the face, pressure in the head, dizziness, cyanosis, sometimes nausea and vomiting We had occasion to watch the action of this group in a private patient of ours We prescribed 0 3 gm of anesthesin (a benzol derivative which belongs to the amido group) for a patient with peptic ulcer to relieve his pain and nausea, and it caused alarming symptoms of methemoglobinemia lasting several hours The patient was sent to a hos-

pital where the intern was so certain the attack had been caused by anesthesin that he gave the patient half the original dose with repetition of the attack and identical symptoms of methemeglobinemia The patient apparently had an idiosyncrasy so that the smallest dose brought about alarming symptoms In the industries employing the amido group of benzol derivatives, the same tendency to methemoglobinemia is seen

The clinical course described above for chronic poisoning in industries employing benzol and its derivatives also occurs in the therapeutic use of certain drugs closely related to benzol These drugs will be briefly commented on because of their medicolegal importance and their widespread use in therapeutics, if not in the industries The most prominent of these drugs is arsphenamine, whose toxic action on the bone-marrow is in all probability caused by the benzol ring which it contains An aplastic anemia occasionally results with marked neutropenia, then thrombocytopenia and secondary anemia several months after a course of arsphenamine injections Two such cases came under our observation at Beth Israel Hospital three years ago, both recovered after fifteen to twenty transfusions, even though both appeared critically ill for many weeks [18]

Pyramidon, too, has been found to cause (rarely) granulocytopenia and later hemorrhagic diathesis This may not only be due directly to the pyramidon, which contains the benzol ring in its formula, but to the presence of benzol itself, used widely as a drying agent for the pyramidon powder

Shapiro and Lehman[19] have reported a case of agranulocytosis following the injection of cinchophen, and have advanced the theory that this developed because of the depressant effect on the bone marrow of the benzol liberated from the cinchophen (which the cinchophen had acquired during its preparation)

Mention must finally be made of a drug which for a while enjoyed notoriety in the treatment of obesity, namely dinitrophenol The deaths from agranulocytosis and aplastic anemia caused by this drug were probably due to the benzol ring which is the major constituent of dinitrophenol We have seen one case of this kind The patient was a young woman who was extremely obese A proper dose was prescribed by her physician but she increased the amount in order to lose weight more rapidly She developed thrombocytopenic symptoms with fatal termination

Treatment

Returning now to occupational diseases and the treatment in these chronic benzol poisoning cases, one is struck by the simple fact that the prophylactic approach offers the best results Proper ventilation is very important in the benzol industries When the patient is found to show the early effects of poisoning such as leukopenia and is removed from the industry, he is usually spared a serious blood disease If the illness is in its early stages, i e confined largely to the leukocytic tissues, nucleotide injections may be of benefit But during the severer later stages where the mortality is usually between sixty to eighty per cent, these cases need frequently repeated blood transfusions if any real help is to be given them Blood transfusions must be persisted in no matter how hopeless the clinical condition appears as our two cases of benzol poisoning after arsphenamine administration show [18]

Summary

In conclusion these facts should be stressed that the hematopoietic system in general is very resistant to disease, that it may be affected however in predisposed individuals after relatively long contact with benzol, x-ray, radium, and lead Each of these agents has a special affinity for a particular part of the blood system Benzol first acts on the leukoblasts causing a leukopenia, it later affects the platelets and red blood cells to give an aplastic anemia which is usually fatal The leukopenic stage is still reversible, the aplastic usually is not The only efficacious treatment is repeated blood transfusions X-ray and the radioactive substances have a special affinity for the hemolymph glands, not the bone-marrow The action is stimulatory and causes a lymphocytosis, either relative or absolute This is still a reversible stage Later hemorrhagic diathesis develops and

laise, pallor, easy fatiguability, and loss of appetite It is of the greatest importance to examine the blood as soon as symptoms of this kind appear in a worker in a benzol trade There is moderate neutropenia, but no change in the red blood cells and no reduction in hemoglobin at this stage In many cases an increase in blood platelets begins to make its appearance, to be followed later by a decrease [14] An individual with these blood findings should not be allowed to continue working with benzol, for if he is removed from this menace at this stage, he will recover rapidly

If employment is not discontinued, the leukotoxic effect of benzol goes on until eventually there is reduction in the polymorphonuclear cells There may be only 1000 or 2000 white blood cells with a polymorphonuclear count of twenty per cent to forty per cent, or even as low as ten per cent Immature cells (one to two per cent myeloblasts) are frequently seen in the blood The reduction of blood platelets keeps pace with the fall in the white blood cells, both quantitatively and qualitatively There are external manifestations of hemorrhagic diathesis—bleeding from the gums, nose, pharynx, uterus, and even gastrointestinal tract

During this period the patient presents a picture of malignant thrombocytopenia, a mistaken diagnosis of essential thrombocytopenia is easily made

The erythroblastic system is not affected qualitatively but quantitatively, secondary to the loss of blood Evidence of the regeneration of red blood cells, such as the presence of reticulocytes or nucleated red blood cells is not present If the correct diagnosis is made, even at this stage of the disease, repeated transfusions may improve the patient, and in some instances may even lead to recovery

Instead of the typical clinical picture in benzol poisoning outlined above, there may be variations Polynucleosis may be present instead of leukopenia, especially if there is a focus of suppuration anywhere in the body Even in animal experiments if an infection is caused by injecting bacteria in addition to benzol, leukocytosis results, instead of leukopenia Under normal conditions the red blood cells are reduced only in number Abnormalities however, are not unknown to occur in size, shape and staining properties Stippling of the red blood cells, reticulocytes and even nucleated red blood cells, as well as a high color index, have been reported Cabot[15] has shown regenerative forms of red blood cells such as are seen in pernicious anemia

Alice Hamilton[13] has called attention to two features that are particularly the source of much difficulty in diagnosis One is the great variation in susceptibility of individuals, exemplified by cases of severe fatal poisoning in a factory where other employees show no symptoms of poisoning The other is the progressive, cumulative action of the poison after exposure has ceased Once injury to the bone marrow is sufficiently extensive, the process progresses even when there is no further contact with the chemical Four of Santesson's nine girl patients,[10] for instance, developed serious symptoms only after they had left the factory where the contact occurred Rohner[16] described a man who left the factory where he worked merely because the fumes of benzol irritated his eyes, and soon afterwards developed fatal aplastic anemia

SCHMINKE TUMORS

MURRAY BERGER, M D *New York City*
Lincoln Hospital

In 1921 Schminke[1] described a tumor which he called lymphoepithelioma. This peculiar tumor arises from the lymphoepithelial organs—the pharyngeal, faucial and lingual tonsils The question whether lymphoepithelioma and transitional cell epithelioma are identical tumors or represent different types has not been decided

Quick and Cutler[3] studied a group of cases at the Memorial Hospital Their cases presented the same clinical symptomatology but were somewhat different in their histologic structure and were termed by the authors "transitional cell carcinomata" (1927) In 1929 Ewing[4] published a study of lymphoepitheliomata in which he confirmed the occurrence of the tumor described by Schminke He maintained, however, that the group of cases which was termed "transitional cell carcinomata" at the Memorial Hospital presented different histologic structures, but even so the response to irradiation and the clinical course were identical in his cases with those termed "lymphoepithelioma" He also mentioned the fact that Laccasagne, with whom he had discussed this problem, had stated that the cases described "transitional cell carcinomata" at the Memorial Hospital would be termed lymphoepithelioma by the Paris school Erdheim feels that in order to make sure of the pathological diagnosis the patient should be watched from the clinical standpoint

This group of intraoral carcinomata have certain outstanding characteristics such as (1) They are extremely radiosensitive, (2) they have more or less a characteristic clinical course, (3) they metastasize early, (4) there is an absence of squamous characters, hornifications, and pearl formation, (5) they run a rapid course

Microscopically the tumor consists of masses or strands of large polyhedral to thick spindle-shaped cells with large round or oval hyperchromatic nuclei The stroma is usually delicate. Large numbers of mitosis are usually present

This tumor is seen in three places tonsil, base of tongue, and the nasopharynx. The primary tumor is usually small and often undetected especially when it develops in the nasopharynx where it usually arises in the recessus pharyngeus Owing to the promixity of the primary growth to the nervous system at the base of the skull, a variety of symptoms may be presented, which is why they are often overlooked Symptoms of involvement of the Eustachian tube, second, third, fourth nerves, to the second and third divisions of the fifth and sixth, the Gasserian ganglion, sella turcica or the jugular foramen should immediately suggest the possibility of a tumor As a rule the trigeminal or abducens nerve is the first involved It also appears that the ophthalmic branch of the trigeminal is apt to be invaded earlier than the other branches and that the motor branch of the same nerve is only rarely involved The involvement of the various cranial nerves can be best explained by an anterior extension of the tumor growth into the anterior portion of the middle cranial fossa In the nasopharynx syndrome, pain may simulate that in acute condition of the ear Pain may be constant or recurrent extending over the cheek mastoid region, frontal and temporal regions or to the eye One patient complained of diplopia and severe frontal headache for six weeks Some patients have no pain, they seek relief from enlarged glands of the neck Early involvement of the cervical lymph-nodes is one of the characteristics of this tumor The lymph-nodes involved are those of the superior deep cervical group and usually on the side of the primary growth The earliest affected are those lying on the jugular vein behind the angle of the jaw From here the invasion extends to the whole deep cervical group The lymph nodes are hard and usually freely movable Recognition of this early lymph node involvement is extremely important, in view of the frequent failure to detect the primary small growth

the patient responds poorly to treatment pital where the intern was so certain Lead causes the least serious of the blood dyscrasias Its affinity is for erythroblastic tissue, depressing red blood cell formation The body in almost all cases compensates for this by regeneration The anemia is usually part of generalized lead intoxication and yields to the usual iron treatment for secondary anemias The therapeutic desiratum in all occupational blood dyscrasias is to recognize and treat them in the functional reversible stage—and not in the organic irreversible stage

WINTER COMPLAINT"

Babies and young children need to be as carefully protected at this time of the year against "winter complaint" as they do during the warm weather against "summer complaint," Dr J H M Knox, Jr, Chief of the Bureau of Child Hygiene of the Maryland State Department of Health, said recently, in discussing seasonal disease hazards for young children, as quoted in the *News Letter* of the Suffolk County Medical Society

By "winter complaint" Dr Knox said he meant influenza, tonsilitis, pneumonia, bronchitis and other diseases of the respiratory or "breathing" system as distinguished from "summer complaint" which attacks the digestive system He said, "Diseases like pneumonia may develop from a neglected cold, they may follow as an after-effect of measles or whooping cough or one of the other so-called children's diseases, or they may occur suddenly and with very little warning

They are more prevalent in winter than in summer and they are even more difficult to combat than the digestive ailments Nearly all are spread through the secretions from the nose and mouth

"These respiratory diseases are particularly dangerous to babies and young children Those not in vigorous health are more susceptible to these infections The first line of defense is to strengthen their powers of resistance against ill health, the second is to keep them under regular medical supervision, the third is to keep them away from others—young or old—who have coughs, colds or fevers

"A child's resistance to disease can be greatly increased by establishing a regular routine as outlined by the family doctor Food suited to the child's needs, a balanced diet supplemented by a daily allowance of cod liver oil, orange or tomato juice, sunshine, fresh air, a daily sponge followed by a brisk rub with a coarse towel, regular hours for sleep and plenty of it, freedom from excitement, clothing adapted to the weather with special regard to sudden sharp changes of temperature, are among the essentials for normal growth and health A baby's feet should be kept warm at all times, but the covering should not be enough to make him perspire visibly The run-about child who is allowed to remain for hours with cold, wet feet is apt to take cold and perhaps develop something more serious

"Well children under three should be taken to the doctor two or three times a year, and oftener if the child is not gaining satisfactorily The doctor should be sent for without delay when any suspicious symptoms are observed

"The importance of keeping young children away from others who have colds, or any other infectious disease can not be emphasized too strongly The utmost care should be exercised by those who have colds, and who are unavoidably brought into contact with young children not to cough or sneeze so that the spray of saliva reaches the children"

ease completely (b) In advance cases, where there is extensive local involvement or distant metastasis, irradiation should be given only as a palliative measure

3 *Infection in the surrounding tissues* Cases in which infection is present must be carefully treated with small doses over a long period of time to prevent precipitation of untoward reactions

4 *Location of the primary tumor* (a) In the nasopharynx, the tumor should be cross-fired from both sides of the face, and often a third posterior field may be advisable, the glands of the neck should be treated separately In all these cases the Coutard method seems to give better results (b) In the tonsils, treatments from both sides of the face and neck should be given, and very often a simple fractionated method may give excellent results (c) For lesions located in the base of the tongue and in the larynx, the Coutard method seems to be preferable

After the patient has received the required amount of radiation several weeks are allowed to pass and then the residue of the growth is removed by electrocoagulation The prognosis depends on the stage of the disease and the location of the tumor Seeing a patient before metastasis, we are naturally able to prolong life When the growth is in the tonsil we also give a better prognosis The average duration of life is about two and a half years, but five year survivals have been reported

I wish to present a few of my cases that are still alive

Case 1 A man, age thirty-five, came into my office in March 1935, complaining of deafness in the right ear, occasional headaches, and difficulty in breathing on the right side This had been going on for several weeks and now he felt that the right naris was completely obstructed Physical examination showed a well-nourished individual in distress The right nostril was full of polypoid tissue Hearing was impaired on the right side with practically normal bone conduction, indicating a conduction deafness X-ray and Wassermann were negative A few days later I removed all the polyps that I was able to see The patient was immediately able to breathe again and the hearing seemed to have improved However, during the operation I noticed considerable bleeding which I had never seen when operating on polyps Three weeks later the patient came back and I was amazed to see the same obstruction as before the operation I then performed a biopsy and the report was a Schminke tumor This patient then received radon seeds plus numerous x-ray treatments and within two weeks the nose cleared Three months later we noticed two cervical glands at the angle of the jaw and we gave some more radiation It is now a year and the patient is back to work and doing well and there are no signs of any metastasis

Case 2 Male, age forty-four, was referred to me because of deafness in right ear, difficulty in swallowing, and expectoration of blood He noticed a mass in the neck at the angle of the jaw Examination revealed a deeply excavated ulcer at the base of the tongue which extended to the lateral wall of the pharynx There was a slight deviation of the tongue on protrusion Blood Wassermann, spinal fluid, and x-ray of skull were all negative I removed the lymph node and on section it revealed a typical lymphocarcinoma A week later the patient complained of loss of mobility of his tongue He disappeared

Case 3 Female, age fifty-five, complained of lump in throat for last two weeks Examination revealed an acutely inflamed granular mass arising from the tonsil invading both tonsillar pillars and running up behind the soft palate. A biopsy was taken at once with an electric knife and it revealed a Schminke Radon seeds were then inserted, and later followed a series of x-ray treatments It is now two months later and the mass has seceded immensely, at present, I am coagulating the residue

The time is too short to predict the ultimate fate of these patients

"Yes, sir What is it?"

"Well, I want four front teeth and a collar bone"—*Automobilist*

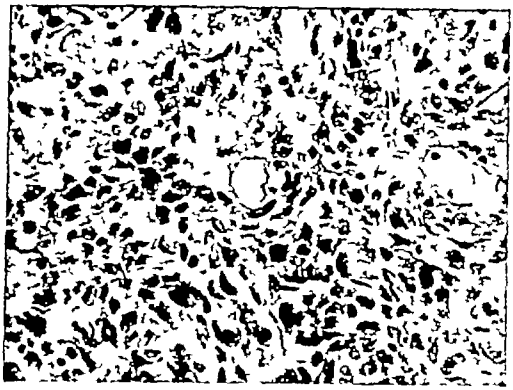

Fig 1 Section of tonsil showing areas of a typical transitional epithelium with mitotic figures and anaplasia (Schminke tumor)

This lesion is most common in the tonsil and it is more or less characteristic It presents a finely granular, velvety surface which looks like an erosion of the mucous membrane rather than a frank coarse ulceration, with an indurated border, a depressed ulcerated crater as of the more common squamous type The Schminke is flatter and it requires very little radiation to destroy it, compared to the squamous type which is radioresistant (Fig 1)

In case of the nose, there is difficulty in breathing through the affected side The growth has a tendency to fill the entire naris The patient complains of a mucosanguineous discharge It then involves the sinuses, continues to the orbit and then we have symptoms of pain in the eye, failing vision, and diplopia (Fig 2)

When the lesion originates in the tongue, the first symptoms are usually difficulty in swallowing, later, due to the involvement of the epiglottis, there may be difficulty in breathing Hemorrhages occur occasionally The tongue has a tendency to deviate to one side or else it protrudes Eventually anemia and metastasis cause death

Diagnosis

Early diagnosis is extremely important and yet sometimes very difficult due to the fact that the primary growth is as a rule very small Recognition of the early lymph node involvement will often save the patient many months of life A history of glands in the neck with the previous clinical symptoms, plus a positive biopsy and immediate response to radiation will tell us that we are dealing with a Schminke tumor

You must differentiate this particular from the ordinary polypoid tissue, sarcoma, lues fibroma, Tbc granuloma, and Hodgkin's disease

As for the treatment of this condition I will quote Dr Kean, who has had considerable experience as a radiologist with this type of carcinoma After performing a biopsy with a radio knife, no other surgery is done until the patient has had the required amount of x-ray His plan differs somewhat with each patient depending on the following

1 *General condition of patient* Patients who have no systemic disease, respond better to radiation and can be treated more intensely, the others have to be treated more carefully and supporting medication or blood transfusion is often necessary

2 *Stage of the disease* (a) Early cases, where no extensive metastasis to the neck or extensive local destruction of bone are present, should be treated more intensely with a view toward eradication of the dis-

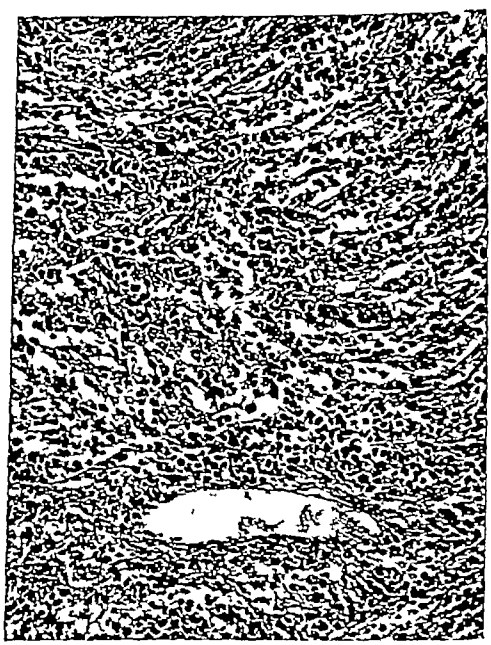

Fig 2 Section of nasal polyp showing large epithelial cells with pale staining nuclei infiltrated with lymphocytes Many mitotic figures can be seen

or indirect. In this paper we consider direct intra-abdominal injuries to be those in which there has been penetration of an intra-abdominal organ by the contact force causing injury. Indirect injuries are those in which the contact force causing injury has not penetrated the peritoneal wall, or, if it has, has not injured an intra-abdominal organ. In general, the types of contact force that cause direct injuries are those in which a sharp point is present as knives, pitch forks, sharp steel, as in auto-accidents, and gunshot. Indirect injuries are caused by blows of solid objects as a blow from the fist, the foot, hitting a wall or crushing injuries, as well as force transmitted through from the extremities, as in landing on the feet in a fall.

3. The organ injured is of great importance both as to surgical procedure to be performed and prognosis. A ruptured spleen, lacerated liver or bladder have different problems confronting the surgeon and different prognosis than a ruptured section of the intestinal tract. The factors of hemorrhage and infection are present in all these injuries, but, in general the first group is a problem of hemorrhage, the latter a problem of infection.

It must be mentioned that indirect injuries are related in their site to the factor of force applied diffusely or locally. Localized blows as of a fist are likely to injure intestines, mesentery, kidney or bladder. Diffuse force as in crushing or a fall is more liable to injure the spleen, liver or pancreas or to rupture the diaphragm. Likewise the site of an indirect localized force is of significance in sometimes suggesting the organ affected. However the local trauma to a circumscribed area of abdominal wall may be confusing and tend to blind the hasty surgeon. Large deep hematomas in the abdominal wall may often suggest the acute abdomen. In like manner, rupture of the rectus muscle will give a similar confusing picture.

Another factor influencing the presence or absence of intra-abdominal injury is the state of the individual organs of the patient's abdomen and abdominal wall at the time of accident. The relaxed abdominal wall needs much less force than that with taut musculature to cause an injury to the intraperitoneal organs. A distended stomach, intestinal tract or bladder is more liable to rupture than an empty one from indirect force. The diaphragm is less liable to rupture in full inspiration than in expiration.

Pathological conditions of the intra-abdominal organs are of significance as much as the previously mentioned physiological conditions. Hepatomegalia, splenomegalia, hydrops of the gall-bladder, diverticulitis, gastric ulcers, carcinoma, hydronephrosis, and tabetic bladder as well as megacolon—all predispose to rupture of these organs by indirect violence.

Of the individual organs affected by indirect violence the spleen is the most commonly injured.[1] Here the problem of hemorrhage and resultant shock are the only factors of importance. Early diagnosis is paramount to successful therapy. Naturally a blow to the upper left quadrant, left back or indirectly as in landing on the feet following a fall are the usual etiological factors. The local history is one of sudden abdominal pain and often pain in the left shoulder. Nausea and weakness from shock may be present. Examination reveals abdominal rigidity and an increase in the area of splenic dullness. This latter does not usually change on movement to the side, due to the clotting of blood. Rapid pulse, increase in respiration, and other signs of hemorrhage are present. The blood picture as presented by the laboratory is likewise one of hemorrhage. The hemoglobin and red blood count after a slight increase falls only after a period of hours, as it takes time for blood volume to be augmented by fluid from peripheral tissues in anemia. Rapid bleeding will increase the rate at which this process takes place. Immediate intravenous fluids are necessary to combat shock and often blood transfusions. As soon as the diagnosis has been made and shock allows, laparotomy should be performed. The time at which this is performed and the evaluation of the patient's condition and ability to stand the procedure entails surgical judgment of the best. Occasionally the injury may be such that the organ may be resutured, but, in any case of doubt splenectomy should be performed. If this latter is not done the peritoneum should not be closed until it is definitely established that no bleeding is taking place. There is no great risk in

INTRA-ABDOMINAL CONDITIONS DUE TO TRAUMA

WILLIAM T DORAN, M D, F A C S and WILLIAM T. DORAN, JR., A B, M D
New York City
Attending Surgeon, Fourth Surgical Division, Bellevue Hospital, Clinical Assistant Surgeon, Fourth Surgical Division, Bellevue Hospital

Careful minute observation, prompt accurate diagnosis, and early competent treatment entailing mature conscientious judgment are the factors of importance in intra-abdominal conditions due to trauma Each factor is of paramount importance and the surgeon presented with such a case must excel in all Any one failing to evaluate these rules is likely to treat his patient inadequately

It is not easy to secure careful minute observation The patient may not be conscious and often his and observers history is clouded by hysteria Such patients must be observed continuously by competent nursing and intern staffs in the hospital, and by the surgeon himself as much as possible Frequent temperature, pulse, and blood pressure readings must be taken and careful note made of the nature, place, and instrument of injury as well as the changing general appearance and mental status of the patient Diagnosis cannot wait for convenience or indeed often times until it is obvious Far too frequently this is done and then it is too late Laboratory procedures such as blood counts, urine, and flat plate of the abdomen can, however, always be accomplished quickly and may afford great diagnostic aids Treatment must be instituted as soon as the diagnosis is made as to the extent of the injury It must be adequate, and, the patient's condition often calls for the greatest skill in the deftness and speed in which the surgical procedure is accomplished, lest the amount of shock entailed be overpowering Also supportive treatment must be instituted immediately the patient is admitted to the emergency ward

The most important factor, if any, is that of judgment Experience of the attending surgeon is tantamount to successful diagnosis and therapy To recognize the true situation present at the bedside, to institute the proper therapy, and to know the extent of surgical procedure the patient will tolerate, means success to the surgeon and life to the patient Proper judgment is the most difficult task in all surgery

The wisdom of these factors is shown by a simple study of statistics The mortality and disability arising from such conditions is in direct proportion to the facilities of the hospital to which the patient is admitted and the surgical maturity and judgment of the attending surgeon The primary purpose of this paper is to impress this fact on the general practitioner and to urge him in all cases to seek the best surgical consultations available Excellence in a surgeon is always illustrated in his willingness and eagerness to secure the judgment of his colleagues In this manner alone will the medical profession be able to appreciably reduce such mortality

Intra-abdominal conditions due to trauma must be considered along three different lines

1 Internal hemorrhage or shock
2 Manner and instrument of injury
3 The organ or organs affected.

1 Of these the first is of greatest importance in as much as they must be considered and treated first Unless this is done, all other factors are useless Here judgment is of supreme importance Almost all cases of intra-abdominal injury due to trauma have one or the other of these conditions and very often both The proper evaluation of the condition qualitatively and quantitatively must be decided. Experience is the great teacher for this, but experience must go hand in hand with the painstaking frequent nursing and intern observations aforementioned It is common knowledge, that in internal hemorrhage there is, *first,* an increasing pulse rate, *second,* increasing pallor, *third,* increasing air hunger, *fourth,* restlessness, *fifth,* later, a falling blood pressure In shock there is early, *first,* diaphoresis, *second,* falling pulse followed by a thready pulse, *third,* pallor, *fourth,* early fall in blood pressure. These facts are well-known but too often are not recognized, and accurate charts to help evaluate them, kept

2 The manner of injury may be direct

direct violence from without or by spicules from a fractured pelvis Urine usually seeps into the retroperitoneal tissues between the rectum and the bladder, and as it accumulates works forward over the pubis to the anterior abdominal wall Local drainage is needed Perineal approach is advisable When the peritoneum is perforated, immediate operation is indicated The operator should explore the space of Retzius, suture and repair the bladder wound, wash out the abdominal cavity with warm salt solution, drain the abdomen, and institute both suprapubic and urethral drainage

Laceration of a ureter is rare due to its small anatomical nature. Likewise indirect rupture of the ureter is rare although crushing injuries may catch it as it crosses the brim of the pelvis over the vertebral column This is a problem of infection and chemical irritation Diagnosis is suggested by an enlarging retroperitoneal mass, anuria from one uretreal orifice and occasionally hematuria Treatment is laparotomy with end-to-end anastomosis of the ureter or anastomosis to the bladder If this is impossible, ligation of the ends of the ureter should be attempted if the other kidney is normal, functionally The kidney on the affected side will then atrophy or go on to hydro- or pyonephrosis and may be dealt with subsequently

More frequently the ureter is inadvertently severed during a pelvic operation or perforated during ureteral catheterization

The other solid organ affected occasionally is the pancreas Anatomically it is difficult to rupture this organ without injuring other organs When it does occur, symptoms are profound shock with severe epigastric pain radiating through to the back, gastrointestinal nausea and vomiting, evidence of hemorrhage, and occasionally of upset carbohydrate metabolism

Shock is more severe in the pancreatic lesions than in any other intra-abdominal injury The surgical problem is most difficult The pancreas may be exposed through the gastrocolic omentum, the transverse mesocolon or posteriorly through the back Occasionally bleeding points may be located and ligated Most commonly the operator can only pack by means of gauze pack and rubber dam Hemorrhagic pancreatitis will develop if surgical intervention is postponed The cases surviving conservative therapy develop suppurative or gangrenous processes, chronic pancreatitis with diabetes, or cysts

Any portion of the intra-abdominal intestinal tract may be injured directly Naturally the small intestine with its position and length is more often injured by direct injury and is often penetrated in numerous places rather than in one place Indirect violence most commonly ruptures the small intestine This is explained by the fact that injury is more liable to occur near a fixed portion of the intestine which is evidenced by ileocolic juncture, duodenal-jejunal juncture or the second portion of the duodenum The cecum, hepatic and splenic flexures, and the sigmoid are most liable to be ruptured indirectly in the large intestine The type of injury is usually local and crushing in nature The problem presented is one of infection locally, with generalized peritonitis following If the rupture is high in the small intestine the bacterial feature is secondary, and chemical irritation is more marked [2] Mortality is in direct ratio to the position of the wound in the intestinal tract with a rapid rise in mortality the lower the wound History is one of acute pain, tenderness, occasionally vomiting with shock clouding the picture The physical findings are rigidity, tenderness, muscle spasm, and presence of air under the diaphragm obliterating liver dullness In these cases flat plate is of great importance as it often reveals air over the liver before this may be elicited clinically A leukocytosis and polymorphonuclear rise with Schilling shift to the left is usually soon present It should be remembered that a direct wound through the pleural cavity may penetrate the stomach or intestine if the penetrating missile is pointing downward

As soon as diagnosis is made, and often even if only suspected, exploratory laparotomy should be performed The wound should be located as quickly and deftly as possible, always remembering that one is working in a contaminated field If the wound or wounds in the

splenectomy in as much as its functions are assimilated by other organs and temporary blood alterations are readjusted completely in a year Intravenous fluids, blood transfusions, and sedation postoperatively are major factors in the therapy

Next in frequency affected by indirect violence is the liver, as it is also commonly injured directly Blows to the right upper quadrant and crushing injuries compressing the liver posteriorly are usual etiological factors It should be remembered that the thoracic cage is of considerable protection to the liver preventing more frequent injury As in the spleen the problem is one of shock and hemorrhage History of epigastric pain and right shoulder pain is frequently present Examination reveals tenderness in the right upper quadrant, rigidity, and an increasing tumor in this area with the signs of hemorrhage Bradycardia is often associated with liver injury Laparotomy is urgent and more frequently reveals injury to the right than to the left lobe The usual finding is a torn capsule with associated parenchymal tear and hemorrhage Hepatectomy is impossible Mortality due to difficulty of diagnosis and therapy is high—about forty per cent Suture and hemastasis are the only positive surgical maneuvers applicable In as much as the liver is such a vascular and friable organ approximation alone of the wound edges by deep mattress sutures or the so-called ribbon-gut of Dr Lowsley, using large dull pointed needles, is advisable Often in severe cases strips of rectus muscles or vaseline gauze mattressed into the wound are necessary for hemostasis Only too often all one may do is pack the wound with gauze These wounds should be drained with cigarette drains, within rubber dams and gauze strips as there is always biliary and serous drainage Complications are secondary hemorrhage, biliary peritonitis, infections causing subdiaphragmatic or intrahepatic abscesses or thrombophlebitis of part of the portal system Purulent material in the liver causes very high febrile rises (106 to 108° F) Transfusions pre- and postoperatively are very necessary

Of the solid organs the kidney is often injured Blows in the flank, crushing force, and force transmitted through the extremities as well as a large portion of direct injuries, as stabbing, affect this organ History is one of pain in the region, frequency, and hematuria with often dysuria Examination reveals a tumefaction in the flank and often deep in the abdomen Whether there are abdominal signs depends on whether the mass is large and whether the peritoneum has been torn allowing blood or seepage intraperitoneally Here the problem is shock and hemorrhage and, with spillage of urine, infection When the ureter is clogged with blood clot there may be no gross hematuria After resolution the flank tumor may become fluctuant

Treatment of kidney lesions vary with the severity of hemorrhage and the presence of infection Due to its anatomical position mild hemorrhage is controlled by topographical hemastasis, conservative rest therapy with ice and sedation is indicated With persistent bleeding extraperitoneal approach with the Bevan incision is indicated Surgical procedure is the same as in the spleen Suture repair, partial resection or nephrectomy depends on surgical judgment In all questionable cases it is wisest to perform nephrectomy if the other kidney is normal Free drainage by indwelling catheter is essential if the ureter postoperatively clogs when repair is attempted

Rupture of the bladder is usually the result of direct injury but may occur when the pelvis is crushed with jagged spicules of bone projecting, or by indirect blows when the bladder is distended The problem is primarily one of infection although hemorrhage to more or less degree is usually present It should be remembered anatomically that rupture may be intra- or extraperitoneal or both Intraperitoneal rupture is usually due to direct violence or when the bladder is distended Here a chemical peritonitis due to urine is present and this, in most cases, will become bacterial if not treated promptly The symptoms are usually lower abdominal pain in the midline, with anuria Examination reveals rigidity of the lower recti muscles, tenderness, and blood on catheterization

Extraperitoneal rupture is caused by

ARTHRITIS

Treatment by Physical Therapy

JOSEPH ECHTMAN, M D, *New York City*

"Arthritis has become in the United States the subject of much more intensive study in many of our research institutions " because "definite evidence is at hand to indicate that we are seeing and hearing of many more cases of arthritis today than we noted previously In the past few years, much new and useful information has been brought to light for the betterment of this class of cases There is still much, however, to be learned As newer information is added to what we already know, we shall be enabled to hasten still further the relief and cure of this rapidly increasing class of sufferers" Thus spoke Lautman[1] in 1936 It is hoped that the experience here presented may constitute a useful grain of that information, and, if this report of ten years' work proves to be at least that much I shall feel rewarded for my years of labor

It seemed necessary, in order to see what physical therapy can do in arthritis, to personally supervise and even personally administer most of the treatments given to a large number of patients in an active clinic in the same fashion as in private practice This was done and the progress of each patient was watched from the beginning to the end of treatment In addition to the usual, there were used by me many ionization methods which are not generally known to physical therapists and are not found in medical literature The beneficial effect of these original procedures has been personally verified in a total number of cases that exceeds six thousand

Classification, without definite percentages, of the various arthritic conditions has been made in accordance with the methods of therapy by which each group was most favorably benefitted Considered in this way the bases fell readily into six classes or groups—(1) Thermal, (2) Ultraviolet, (3) Salicylate, (4) Lithium, (5) Magnesium, Sulphate, Sodium Chloride, (6) Iodine

Thermal Group

To this belongs gonorrheal arthritis While other types of arthritis are also benefitted by heat, the representative, however, is that due to gonorrheal infection because it is most favorably benefitted in all its stages by thermal measures, such as infrared, diathermic heat, and fever therapy So far as I am aware, no form of ionization has ever benefitted this condition materially *

The employment locally of infrared radiation alone proved to be of benefit Conventional short or ultra short wave diathermy were superior to infrared The application of thermal measures to the site of the focal infection, prostate, seminal vesicles, cervix, etc, in addition to the treatment of the affected joint (Comberbatch's method) was of special advantage

Fever Therapy While it is known that most striking results have been obtained by fever therapy, the danger of this treatment should be realized "Death has occurred many times from fever therapy in the desire to cure the infection A point that should be emphasized is that the thermal death point of the gonococcus is only one-half degree Fahrenheit below the average thermal death point of man " (Clark[2]) One of the greatest authorities on fever therapy, Dr Walter Simpson,[2] voices a warning that "fever therapy is analogous to a surgical procedure or, in other words, that the patient must be a surgical risk before fever therapy can be prescribed safely" It is notable that the *American Medical Association Journal*[3] and the *Deutsche Med Wochenschrift* refer to this treatment as "heroic" The latter also refers to it as "Gewalt Kur" (brutal cure) and "Pferde Kuren" (horse cures)

For the pathology of the affected joint

* Kling and Sashin have reported (*Arch of Physical Therapy*, 18 333, 1937) results in five cases of gonorrheal arthritis treated with histamine ionization

intestine are small and local, repair with purse-string suture may be attempted If the wound is larger enterorraphy or temporary colostomy should be performed Where there is trauma to the mesenteric blood supply with questionable viability, resection or Mikulicz procedures should be performed In any lesion below the first part of the duodenum it is wise to drain the abdominal cavity Drains should be plentiful and placed in the dependent gutters of the abdominal cavity as well as locally Postoperatively the patient should be placed in high Fowler's position as soon as possible If the wound is high in the duodenum and less than three hours of duration, it is usually permissible to close the abdominal cavity without drainage

The stomach is rarely ruptured indirectly unless distended or having a weak point as an ulcer or carcinoma More commonly it is penetrated by a direct missile The picture presented is that of chemical peritonitis and is identical in symptoms and signs with those of a perforated peptic ulcer Repair is one of surgical judgment and naturally varies with the site and extent of the wound Here because of the upper abdominal wound and the secondary factor of contaminating gastric juices the wound should be sutured most carefully Interrupted as well as continuous sutures should be used in the peritoneum and fascia, and retention sutures of silkworm-gut or black silk added In cases of stomach wounds the abdomen usually may be closed without drainage

Not uncommon, in both direct and indirect injuries, the mesentery is lacerated or torn This is primarily a question of hemorrhage The extent of the injury is of tremendous importance Small hemorrhages may stop spontaneously and form an inflammatory mass. Larger ones may stop spontaneously but very frequently the blood supply to a section of the intestine is shut off and the picture of mesenteric thrombosis develops There is extreme pain and later perhaps vomiting and blood in the stool after gangrene has started Examination reveals little tenderness and rigidity Later of course distention and paralytic ileus are present

Treatment is laparotomy in all cases except when the operator is sure that but a very small hemorrhage not imperiling viability of bowel, is present This of course is rare Occasionally ligation of bleeding points and evacuation of clot is all the procedure necessary More commonly resection of the nonviable bowel as well as ligation of bleeders must be performed It is to be remembered that in the small intestine, tears near the mesenteric base are most serious as a large portion of the blood supply to many feet of intestine may be injured and endangered in a very small wound

Rupture of the diaphragm is rare but is often a very serious injury Pneumothorax with mediastinal shift is always possible Small injuries usually heal spontaneously—large vents should be repaired

It should be remembered that paralytic ileus may follow an indirect injury It is also occasionally found in pelvic or splenic injuries as well as direct injuries to the lower intestinal tract The etiology is neurogenic with reflex cessation or inhibition of peristalsis Nausea and vomiting are early, later there is pain and distention The abdomen is silent to auscultation Frequently this condition is cured spontaneously Surgical pituitrin, pitressin, and prostigmine are useful drugs and Wagensteen apparatus should be used to prevent over distention

In the female during pregnancy both direct and indirect injury may rupture the uterus There is acute shock and hemorrhage Immediate repair is necessary to save life Rarely the nonpregnant uterus, tubes, and ovaries may be perforated directly Hemorrhage is the problem to consider, and suture repair or removal varies with the case

Traumatic hernias are occasionally found Incarceration or strangulation of an already present hernia due to trauma is of course a surgical emergency and should be treated as such

We feel that we should emphasize that in no field of surgery is each case such a distinct individual problem as in intra-abdominal conditions due to trauma

* Kling and Sashin have reported (*Arch of Physical Therapy*, 18 333, 1937) results in five cases of gonorrheal arthritis treated with histamine ionization

intestine are small and local, repair with purse-string suture may be attempted If the wound is larger enterorraphy or temporary colostomy should be performed Where there is trauma to the mesenteric blood supply with questionable viability, resection or Mikulicz procedures should be performed In any lesion below the first part of the duodenum it is wise to drain the abdominal cavity Drains should be plentiful and placed in the dependent gutters of the abdominal cavity as well as locally Postoperatively the patient should be placed in high Fowler's position as soon as possible If the wound is high in the duodenum and less than three hours of duration, it is usually permissible to close the abdominal cavity without drainage

The stomach is rarely ruptured indirectly unless distended or having a weak point as an ulcer or carcinoma More commonly it is penetrated by a direct missile The picture presented is that of chemical peritonitis and is identical in symptoms and signs with those of a perforated peptic ulcer Repair is one of surgical judgment and naturally varies with the site and extent of the wound Here because of the upper abdominal wound and the secondary factor of contaminating gastric juices the wound should be sutured most carefully Interrupted as well as continuous sutures should be used in the peritoneum and fascia, and retention sutures of silkworm-gut or black silk added In cases of stomach wounds the abdomen usually may be closed without drainage

Not uncommon, in both direct and indirect injuries, the mesentery is lacerated or torn This is primarily a question of hemorrhage The extent of the injury is of tremendous importance Small hemorrhages may stop spontaneously and form an inflammatory mass Larger ones may stop spontaneously but very frequently the blood supply to a section of the intestine is shut off and the picture of mesenteric thrombosis develops There is extreme pain and later perhaps vomiting and blood in the stool after gangrene has started Examination reveals little tenderness and rigidity Later of course distention and paralytic ileus are present

Treatment is laparotomy in all cases except when the operator is sure that but a very small hemorrhage not imperiling viability of bowel, is present This of course is rare Occasionally ligation of bleeding points and evacuation of clot is all the procedure necessary More commonly resection of the nonviable bowel as well as ligation of bleeders must be performed It is to be remembered that in the small intestine, tears near the mesenteric base are most serious as a large portion of the blood supply to many feet of intestine may be injured and endangered in a very small wound

Rupture of the diaphragm is rare but is often a very serious injury Pneumothorax with mediastinal shift is always possible Small injuries usually heal spontaneously—large vents should be repaired

It should be remembered that paralytic ileus may follow an indirect injury It is also occasionally found in pelvic or splenic injuries as well as direct injuries to the lower intestinal tract The etiology is neurogenic with reflex cessation or inhibition of peristalsis Nausea and vomiting are early, later there is pain and distention The abdomen is silent to auscultation Frequently this condition is cured spontaneously Surgical pituitrin, pitressin, and prostigmine are useful drugs and Wagensteen apparatus should be used to prevent over distention

In the female during pregnancy both direct and indirect injury may rupture the uterus There is acute shock and hemorrhage Immediate repair is necessary to save life Rarely the nonpregnant uterus, tubes, and ovaries may be perforated directly Hemorrhage is the problem to consider, and suture repair or removal varies with the case

Traumatic hernias are occasionally found Incarceration or strangulation of an already present hernia due to trauma, is of course a surgical emergency and should be treated as such

We feel that we should emphasize that in no field of surgery is each case such a distinct individual problem as in intra-abdominal conditions due to trauma

shown by Maragliano[6] He proved by plethysmographic measurements that the vessels of the skin are dilated by salicylate when taken internally It has, therefore, been administered to those of my patients who suffered from insufficient circulation of the extremities in the effort to relieve their pain Sodium salicylate has also a softening or lytic effect on fibrous tissues This explains its desirable action upon fibrous ankylosis which is so often associated with chronic rheumatoid arthritis Judging from my own experience, I feel safe in expressing my opinion that ionization with sodium salicylate is the best treatment for the salicylate group of arthritis It is indicated in all forms and stages of the disease atrophic, hypertrophic (rheumatoid and osteoarthritis) in the chronic stage as well as in the acute and subacute exacerbations In the latter, ionization is, I think, of the utmost importance because thermal measures are then absolutely contraindicated I am convinced that there is no better method to relieve the pain in those exacerbations than by ionization with sodium salicylate (Russian workers have employed in arthritis ionization with calcium They do not seem to be very enthusiastic about the results) This treatment takes care of the inflammatory processes more quickly than any other physical therapy method available

The technic described by me[7-10] previously holds good for all drugs mentioned in this paper in connection with their employment in ionization, except for histamine and mecholyl

In addition to the ionization treatments, ultraviolet general body radiation was employed for systemic effect in all stages of arthritis There is no contraindication to employ these rays in any stage, provided suberythema exposures are employed (Ultraviolet radiation, by the suberythema method, has no clinical contraindications, according to my experience, the one exception being overactivity of the thyroid)

Some believe on the contrary that ultraviolet erythemas are useful because they provoke or increase the defensive powers of the body, acting thus like foreign protein therapy While an erythema may be usefully produced twice or three times, repeated erythemas especially in the weak or sick, according to my observation, are injurious

Reasons for ultraviolet Radiation Arthritics are benefitted by vitamin D which is supplied by the radiation It is, however, worthy of note that the vitamin is destroyed soon after its formation, if too long or too strong exposures are given—in other words, if given to the point of erythema Blood changes are present in both rheumatoid and osteoarthritis Usually a secondary anemia is noticed which is favorably influenced by ultraviolet radiation The latter also favors metabolism, aids digestion, and according to the investigation of Bunker,[5] imparts energy to the body

The ingestion of a sufficient amount of liver should be encouraged because it aids in blood formation Reduction of carbohydrate intake is advised by various workers and articles of food rich in vitamins are especially advocated

The three vitamins considered to be of importance in the salicylate group are B, C, and D The last is supplied by the ultraviolet radiation Vitamin C, which has a favorable effect on the arterioles, is easily supplied by ingestion of citrous fruits

Vitamin B, which is believed to influence carbohydrate metabolism and neuritis, is not easily supplied because the average foods are deficient in this vitamin and because cooking destroys it

The articles of food having high contents in vitamin B are unpolished rice, whole wheat, internal organs, eggs, etc The yolk of the egg is considered an important article in the diet of the arthritic not only because of its vitamin B content but also because of its richness in sulphur, the importance of which in arthritis is a subject much discussed today

It is possible that nature utilizes the sulphur of the body in the repair of arthritis and, therefore, less of it is left for carbohydrate metabolism Pemberton,[11] however, states that "no constant changes in total sulphur metabolism were found to be related to the clinical course of the disease" (arthritis) Senturia,[11] too, found no evidence of disturbance in total sulphur metabolism in arthritics as compared to normals It is my belief that the quantity of sulphur constituting the difference between normal and pathologic

additional local treatment is often necessary even after fever therapy For this purpose, conventional or short-wave diathermy *followed by interrupted* sinusoidalization has been employed by me

It is important that the sinusoidalization or some other form of exercise of the affected joint should be started early It has seemed to me that the ankylosis occurring in gonorrheal arthritis, if neglected, becomes more difficult to manage than that of the rheumatoid or traumatic varieties and a greater percentage tends to become permanent A young woman referred to the clinic for chronic gonorrheal arthritis of the wrist of one year's duration had a completely ankylosed joint All efforts to improve the condition failed This was not the only case I have seen in my experience Such failures were comparatively more rare in the rheumatoid and traumatic varieties, especially in the former, though it constituted probably about eighty per cent of all the several thousands of arthritic conditions under care

Ultraviolet Group

This comprises (a) tuberculous arthritis and (b) psoriatic arthritis

a Tuberculous arthritis In this condition I have employed ultraviolet radiation from the air cooled and water cooled apparatus In the employment of the former, my own suberythema method[5] was strictly prescribed Some workers are employing infrared radiation or short-wave diathermy instead of ultraviolet radiation (I learned about two years ago by personal communication, that in some sanatoria infrared is employed in tuberculous arthritis Liebsny strongly advocates short waves)

I have never utilized any form of ionization in tuberculous arthritis, though in Europe ionization with iodine and calcium (the former on the negative, the latter on the positive pole) for this condition has been employed by some workers

Not many cases of this group came under my care, but those that did benefitted by the treatments The following case of tuberculous polysynarthroditis is, I believe, of interest

A male patient, age four years of Puerto-Rican parents, was referred to the clinic for the treatment of tuberculosis of the facial bones —duration one year (probably longer) The zygomaticofrontal, sphenozygomatic, and sphenofrontal synarthrodial joints on the left side were affected. This was a very pathetic picture. The tubercular pus undermined those synarthrodial joints to such an extent that they became "arthrodial" One could actually feel the separation of the bones and move them with the fingers The pus was oozing out of the outer canthus of the left eye which was much injected, though not yet *tuberculously diseased* I never believed that there was a possible cure for this child, but after eight months of persistent treatment with ultraviolet radiation, local and general, three times a week, the patient fully recovered

b Psoriatic arthritis Some patients suffering from psoriasis complain of pain in the joints The condition has been diagnosed as rheumatoid arthritis These sufferers, however, give a history of a close relationship between the exacerbation and the subsidence of the skin manifestation and the joint pain In fact, whatever tends to relieve the psoriasis relieves the joint discomfort Because of this relationship, the arthritis is regarded as psoriatic

Ultraviolet radiation which has a favorable effect on the dermatologic condition (particularly if the lesions are covered previously to the exposure with crude coal tar ointment, as suggested by Herrick and Sheard*) has also a favorable effect on the arthritis The rays, I am convinced, aid greatly in elimination of the toxic products caused by the lesions which may act as an etiological factor in the arthritis Besides, they possess an analgesic power The treatment was, therefore, given also locally to the affected joint Thermal measures did not seem to benefit this form of arthritis

Salicylate Group

Here belong all those varieties of arthritic conditions in which sodium salicylate is by common consent clinically indicated (rheumatoid arthritis and osteoarthritis, corresponding to the terms atrophic and hypertrophic respectively, also arthritis deformans) In the treatment of this group, the author employs mostly ionization with sodium salicylate Experience with some thousands of such patients proved the paramount importance of ionization with this drug

The action of salicylate by ionization appears to cause vasodilation which influences even the vessels of the skin as

* Crude coal tar, Pulvis Zinc Oxid. āā dr 2, mix with corn starch and petrolat āā oz. 2. Sig cover lesions with a thin layer of the ointment and subject to ultraviolet radiation. (The ointment alone has no effect at all on the lesions)

I noticed that small arthritic joints (interphalangeal) especially of not long duration have appeared to improve more quickly, sometimes astoundingly, with short waves

Because of this peculiar behavior of the short waves, they are not infrequently blamed by some writers as worthless in arthritis Lautman says "Short wave therapy has been widely heralded for the treatment of arthritis So far the results from this type of treatment has been found for the most part disappointing" Lichterman and his collaborators,[14] who employed weak thermal doses in administering short waves in arthritis, claim good results They state "Employing weak doses of short waves, we had almost no failures whether the cases were in the acute, subacute, or chronic stages, with more or less stationary changes in the articular or periarticular tissues"

It is in place here to remark that while some workers believe that it is only the thermal effect that is responsible for the results obtained with short waves, other reliable workers do not share this opinion at all Piontkovsly and Fabricant[15] state that the therapeutic effect of short waves did not seem in their experience to depend on the creation of heat within the tissues, since identical results were obtained with small doses incapable of producing the sensation of warmth I also have had interesting experiences in that direction Lichterman and his collaborators[14] conclude from their investigations and experience that the result obtained by short waves should be regarded as one of the manifestations of the transformation of the high frequency energy within the tissues and the accompanying biological reactions brought forth by that transformation

Taking into consideration these statements it becomes apparent that the establishment of the quality of a short or ultra short wave therapeutic apparatus by means of thermocouple tests, as well as the addition of the word "diathermy" to the terms "short" and "ultra short wave" is unscientific

Fever therapy in rheumatoid arthritis This treatment is considered useful by some workers, and denied by many others Hansson,[16] for instance, states "My experience with hyperpyrexia in other forms of arthritis (rheumatoid) has been discouraging A series of cases of rheumatoid arthritis which I treated with hyperpyrexia showed only temporary relief, and the sedimentation rate was not affected"

Lithium Group

This group comprises gouty arthritis Heberden's nodes, and Still's disease I am inclined to believe that all these three conditions have some common etiologic factor because of the fact that ionization with the same drug—lithium, which is specific in gout*—seems to influence this group more favorably than ionization with any other drug

It was Thomas A Edison who first showed that ionization with lithium was of benefit in gouty arthritis It has been my own experience in treating cases with Heberden's nodes that lithium ionization benefitted the condition more than any other physical therapy method available I, therefore, have thought that Heberden's nodes are probably a form of gout In searching the literature on this malady, I found that Osler[17] writes "Heberden says the nodes have no connection with gout, yet they are often regarded as indicating gout" Luff[18] states "Heberden's nodes are a mild form of gout"

In the case of Still's disease I noticed the same thing, that ionization with lithium influenced this condition more favorably than ionization with any other drug employed in arthritis I have, therefore, put the three conditions—gouty arthritis, Heberden's nodes, and Still's disease—into one group, the Lithium Group

It is worthy of note that diathermy (conventional), which I have tried in many cases of Heberden's nodes, had no effect at all upon them Lithium considerably ameliorated the condition The signs of inflammation—i e the redness, swelling, and the pain—disappeared and the nodes markedly diminished in size They, however, never disappeared entirely even with lithium ionization, which in my experience was the best treatment available for this affection When the progressive improvement from this ionization reaches

* Lithium has an affinity for uric acid

amounts may be so small as to be undetectable

The author has experimented for a number of years with sulphur prepared in a certain way and has found that a quantity less than 1/10 of a grain per day administered to mild diabetic patients causes a disappearance of the sugar in the urine and a reduction of the quantity of the former in the blood, the diet being only moderately controlled [12]

I believe that sulphur and vitamin B play an important role in carbohydrate metabolism (Vitamin B stimulates pancreatic activity and helps to promote normal functioning of anterior lobe of the pituitary body—Funk & Dubin) I suggest, therefore, that they be administered to salicylate arthritis The reduction of the carbohydrate intake, which may cause a weakening effect on the myocardium of the patients would then, possibly, become an unnecessary practice

Case Reports

CASE 1 Mrs F, age thirty-six, was referred to the clinic with the diagnosis of an acute exacerbation of chronic rheumatoid polyarthritis She was a mother of three children She was pale, emaciated, frail-looking, weak, and with no spark of life in her eyes The joint most severely affected was treated daily with sodium salicylate ionization As soon as it was relieved, it was treated only three times a week and another joint more painful than the rest treated daily, etc She also received ultraviolet exposures three times a week The treatments were given for a period of three months with most desirable results When she was discharged, she had no pain in any of her joints She gained weight and looked healthy and rosy When seen the following Winter, she had no complaints

CASE 2 Mrs D, age forty-three, was referred to the clinic for the treatment of osteoarthritis with ankylosis of both knees She had suffered from this condition for three years probably longer Due to the ankylosis, she walked with knees bent at a fixed angle She was treated with conventional diathermy accompanied simultaneously by exercise of the knees for a period of several months without results The treatment was then changed to sodium salicylate ionization followed by interrupted sinusoidalization which was administered three times a week for four months with remarkable results A comparison of the x-rays of the knees taken before and after the ioniza tion treatments showed marked changes in the pathology

CASE 3 Mrs D, age twenty five, a mother of two children, a cardiac patient with a rheumatic etiology, had suffered severely from an acute attack of arthritis of the right sternoclavicular articulation Three treatments by salicylate ionization, given on consecutive days completely relieved the patient

Arthritis deformans The sodium salicylate ionization treatment is also very valuable in patients suffering from this condition Usually patients with arthritis deformans of the hands were referred In these cases, prolonged treatment is necessary to get the desired results

Spondylitis and sacroiliac arthritis I have obtained good results in severe types of these conditions with ultra short wave diathermy (six meters) In some stubborn cases, however, iontophoresis with sodium salicylate had to be resorted to This was preceded by short wave diathermy and followed in some cases by interrupted sinusoidalization

In many cases of spondylitis and sacroiliac arthritis, an accompanying condition may be a myositis, a myalgia, or both, which aggravate the symptoms and interferes with the progress of the treatment Unless one has a method to combat these accompanying conditions, the effort to cure the spondylitis or the sacroiliac arthritis may be useless It has been my experience that the effluve from the Oudin current is specific in myalgia, and infrared radiation specific in myositis

In the treatment of the salicylate group of arthritis thermal measures such as conventional short or ultra short wave diathermy were, of course, also employed when they were indicated In connection with this, I wish to remark that in the majority of cases, short wave diathermy benefitted arthritis of the spine and sacroiliac, more so than the conventional diathermy An occasional patient benefitted more by the latter I have not noticed any advantage in treating large joints with shortwave over the conventional diathermy The pain did not subside more quickly from the former than from the latter Often the beneficial effect of short waves was even less than that of the conventional diathermy *On the other hand,*

I noticed that small arthritic joints (interphalangeal) especially of not long duration have appeared to improve more quickly, sometimes astoundingly, with short waves

Because of this peculiar behavior of the short waves, they are not infrequently blamed by some writers as worthless in arthritis Lautman says "Short wave therapy has been widely heralded for the treatment of arthritis So far the results from this type of treatment has been found for the most part disappointing" Lichterman and his collaborators,[14] who employed weak thermal doses in administering short waves in arthritis, claim good results They state "Employing weak doses of short waves, we had almost no failures whether the cases were in the acute, subacute, or chronic stages, with more or less stationary changes in the articular or periarticular tissues"

It is in place here to remark that while some workers believe that it is only the thermal effect that is responsible for the results obtained with short waves, other reliable workers do not share this opinion at all Piontkovsly and Fabricant[15] state that the therapeutic effect of short waves did not seem in their experience to depend on the creation of heat within the tissues, since identical results were obtained with small doses incapable of producing the sensation of warmth I also have had interesting experiences in that direction Lichterman and his collaborators[14] conclude from their investigations and experience that the result obtained by short waves should be regarded as one of the manifestations of the transformation of the high frequency energy within the tissues and the accompanying biological reactions brought forth by that transformation

Taking into consideration these statements it becomes apparent that the establishment of the quality of a short or ultra short wave therapeutic apparatus by means of thermocouple tests, as well as the addition of the word "diathermy" to the terms "short" and "ultra short wave" is unscientific

Fever therapy in rheumatoid arthritis This treatment is considered useful by some workers, and denied by many others Hansson,[16] for instance, states "My experience with hyperpyrexia in other forms of arthritis (rheumatoid) has been discouraging A series of cases of rheumatoid arthritis which I treated with hyperpyrexia showed only temporary relief, and the sedimentation rate was not affected"

Lithium Group

This group comprises gouty arthritis, Heberden's nodes, and Still's disease I am inclined to believe that all these three conditions have some common etiologic factor because of the fact that ionization with the same drug—lithium, which is specific in gout*—seems to influence this group more favorably than ionization with any other drug

It was Thomas A Edison who first showed that ionization with lithium was of benefit in gouty arthritis It has been my own experience in treating cases with Heberden's nodes that lithium ionization benefitted the condition more than any other physical therapy method available I, therefore, have thought that Heberden's nodes are probably a form of gout In searching the literature on this malady, I found that Osler[17] writes "Heberden says the nodes have no connection with gout, yet they are often regarded as indicating gout" Luff[18] states "Heberden's nodes are a mild form of gout"

In the case of Still's disease I noticed the same thing, that ionization with lithium influenced this condition more favorably than ionization with any other drug employed in arthritis I have, therefore, put the three conditions—gouty arthritis, Heberden's nodes, and Still's disease—into one group, the Lithium Group

It is worthy of note that diathermy (conventional), which I have tried in many cases of Heberden's nodes, had no effect at all upon them Lithium considerably ameliorated the condition The signs of inflammation—i e the redness, swelling, and the pain—disappeared and the nodes markedly diminished in size They, however, never disappeared entirely even with lithium ionization, which in my experience was the best treatment available for this affection When the progressive improvement from this ionization reaches

* Lithium has an affinity for uric acid

a standstill, conventional or short-wave diathermy may then be tried

The technic of therapy for Heberden's nodes is the same as for arthritis of the interphalangeal joints It is, of course, understood that here a one per cent solution of the Lithium salt is employed Almost all the cases treated by the author were women, their ages ranging from 38–50, i e, they were in the climacteric period The etiology of Heberden's nodes may rest in glandular dysfunctions or endocrinopathies which are common in that age period

Magnesium Sulphate-Sodium Chloride Group

To this group belongs traumatic arthritis It should be given proper attention and as early as possible In the acute and subacute stages, in my experience, ionization with magnesium sulphate gives the most desirable and sometimes dramatic results

This drug is characterized by its anesthetic effect, so much that it has been substituted for cocaine in some surgical operations Magnesium sulphate has a biologic effect on acute inflammation due to trauma It causes the tissues to lose alkali thus relieving pain In the acute stage of the trauma pain is due, aside from other factors such as edema, anoxemia, etc, to a disturbance in the hydrogen ion concentration The hydroxyl ions (the alkalinity) increase Alkali is a stimulant, an irritant, and when present in a relative excess becomes a factor in the causation of pain Magnesium ions have a favorable influence on local edema, according to my experience

In the protracted condition of traumatic arthritis characterized by edema, but without adhesions, ionization with magnesium sulphate followed by interrupted sinusoidalization is probably the best method of treatment It is here in place to mention that I employed the same method in stubborn edema in fractures of the extremities with remarkable and even dramatic results[13] While interrupted sinusoidalization alone is of benefit in *traumatic edema, preceded,* however, by ionization with magnesium sulphate, it is of still greater value

Turrell[20] apparently only recently noticed the useful action of interrupted sinusoidalization in edema He characterizes its beneficial effect as follows "The sinusoidal current of lower voltage and greater amperage stimulates all tissue cells within the bi-polar path, recurrent hydrogen and hydroxyl concentration taking place at every interruption simultaneous with the neuro-muscular response This current has, therefore, nutritional effects and is especially indicated in the treatment of edema of extremities"

In the chronic stage of traumatic arthritis with adhesions I employ ionization with sodium chloride This ionization exerts a lytic action on fibrous adhesions when employed with the negative pole.* The treatment is followed by interrupted sinusoidalization

Case Report

CASE 4 Miss S, age twenty-eight, fell and severely injured her left knee She came under the care of an orthopedic surgeon who diagnosed the case as traumatic arthritis complicated by synovitis and possible injured semi-lunar cartilage He put the knee in a cast for four weeks This treatment, however, gave no relief The pain was unbearable, interfering with rest and sleep The surgeon decided that an operation was inevitable, but the patient refused surgery The orthopedic man and the family physician then agreed to give physical therapy a trial, and referred her to me with a request for short-wave or conventional diathermy The patient came in limping supported by a cane She complained of pain, "locking" and a sensation of throbbing in the knee which was red, swollen, tender, and imparted a warm sensation to the touch more marked than in the other knee. There was considerable limitation of motion and

*Sodium salicylate and iodine also possess this lytic quality but to a less degree. The negative pole alone possesses a lytic action which is increased in the presence of sodium chloride The chlorine ions liberated by the galvanic current beneath the material soaked in the sodium chloride solution penetrate the superficial and gradually the deeper tissues, exerting a lytic action on the fibrous tissue there Sodium hydroxide, a mild caustic, is also formed, which influences superficial fibrous tissue such as light scars The author has occasionally combined sodium chloride in certain proportions with other drugs which he has employed in ionization with the belief that the combination yields better results

apparently interference with circulation, for the entire lower leg was swollen, blue, and cold My opinion was that the request for thermal *measures was illogical* as an inflammatory process was still going on in that knee. Because, however, of the chronicity of the case, I cautiously administered the thermal measures requested by the physicians The result was that the pain became more severe and the patient more discouraged I advised the doctors that in this case the most suitable treatment was ionization Six ionization treatments given on consecutive days with magnesium sulphate, markedly relieved the pain This ionization treatment was continued until the pain completely disappeared It was then changed to ionization with sodium chloride followed by interrupted sinusoidalization to take care of the adhesions caused by the cast. Occasionally the ionization treatments were interchanged by short-wave diathermy, followed by massage. The patient received a total of fifty treatments with excellent results

Iodine Group

Little work has been done on this ionization in the United States Ionization with iodine has been employed by Vienna workers in surgical tuberculosis including tuberculous arthritis I have employed this ionization in pyogenic and infective arthritis caused by wounds, in the absence, of course, of any pussy matter Iodine is employed with the negative pole Devitalized tissue cells are stimulated to activity by that pole (Because of its biologic effect, it causes an increase in the [OH] ions which are stimulative) In the presence of iodine, the stimulative *effect is increased* The germicidal effect of the drug adds to the advantage

Comments

Ionization methods in conjunction with interrupted sinusoidalization (as here described) appear to accomplish great clinical improvement by affecting the inflammatory process in arthritis

In particular they benefit greatly the chronic stage and influence ankylosis probably better than any other method available

Summary

Ten years' experience in treatment of arthritis by physical therapy methods has been presented with special reference to iontophoresis

Close personal supervision from beginning to end of treatment in a very large number of patients led to the conclusion that they could best be classified into six groups on the basis of the particular therapy that proved most favorable in each group—(1) The Thermal group (2) The Ultraviolet group (3) The Salicylate group (4) The Lithium group (5) The Magnesium Sulphate-Sodium Chloride group and (6) The Iodine group

*Sodium salicylate and iodine also possess this lytic quality but to a less degree The negative pole alone possesses a lytic action which is increased in the presence of sodium chloride The chlorine ions liberated by the galvanic current beneath the material soaked in the sodium chloride solution penetrate the superficial and gradually the deeper tissues, exerting a lytic action on the fibrous tissue there. Sodium hydroxide, a mild caustic, is also formed, which influences superficial fibrous tissue such as light scars The author has occasionally combined sodium chloride in certain proportions with other drugs which he has employed in ionization with the belief that the combination yields better results

plete, well-balanced accomplishment, that value which develops from well-rounded general management Mary was a "stunter" —she did two stunts well—two marvellous stunts according to us men—but she stunted the growth of her home The home-maker must be a general manager or there will be wanting in that home the order, the style, the atmosphere, the influence in the community and the influences upon children which are unconsciously woven into their natures Yes, John and Mary had children—fine children—but we doubt if any of them would today realize what is meant when you say "The beauty of the house is order"

The stores in which you elect to buy have something more than goods with which to attract and please you You can purchase the same manufacturer's blankets, towels, baby-carriages or canned corn, luggage, bacon or safety pins, at about the same price in two different large stores You automatically choose the one where the beauty and color of arrangements are not all in the exaggerated show-window When you walk in and find the atmosphere of the show-window enhanced, and each counter or section brings new and increasing volume and charm of arrangement, you are much impressed with the values of the goods When you enter the other store where aside from the show-window you receive impression of chaos—more and more expansive chaos as you go—you do not wish to buy—the disorder detracts from the desirability of the goods If the sales girls are surly, say "that is all we have" when you can see many other varieties of the needed article directly before you—that means poor selection or training of sales-force or both The lighting, the ventilation, the atmosphere of pleasant friendliness and desire to accommodate are all elements in the general management of a store upon which may depend success or failure in business Price counts! Yes—but general management more

Visit any factory and envisage the activities that produce necessities and luxuries by cleverly general managed proceedings Each detail is simple enough but the methods of combining and correlating them makes it possible for anyone who chooses to own wonderful possessions at an excessively low price The automobile assembly-line is an interesting example

* * *

The hospitals of America demonstrate many kinds of management systems A hospital is a hotel embellished by service to the sick and injured It would seem reasonable to expect the hotel section to be best managed by a person conversant with hotel operation More reasonable would it seem to have the service to the sick managed by a physician who has a talent for administration Still more reasonable would it seem to have its Board of Directors largely medical or scientific men Taking a birds-eye view of hospital management and you see a heterogeneous crowd of persons most of whom know nothing about the conduct of hotels except what they learn at the expense of the hospital Except for a few medical superintendents the only persons educated in the care of the sick in the remotest way are graduate nurses who are supposed to be physicians' helpers Of course it all depends what the objectives of general management are. We physicians think that the original, primary, most important objective is the salvation and relief of human beings in physical (and perhaps mental) trouble

If there were more physician-superintendents with experienced hotel executives as assistants the economics of hospital management as well as efficiency would unquestionably be served A brilliant example of what may be accomplished by physician management is the outstanding accomplishments under gifted experienced Commissioner of Hospitals in New York City under Mayor LaGuardia, handicapped as he has been by the maintenance of palaces built extravagently under previous unreformed administrations When we consider the background, previous experience, and non-scientific education and associations of most superintendents, many of them must be praised for their records Viewed with clear-visioned criticism of the management of dollars for sick-care, many fall so far short of the ideal as to make angels of mercy weep

The objective of some hospital superintendents seems to be securing profit from competing, at ruinous charges, with physicians immediately surrounding the institution, by emergency ward service, dispensary and even ward service to those able to pay and requiring their unpaid staff to perform

Preventive Medicine

An Evaluation of General Management

CHARLES H GOODRICH, M D, *Brooklyn*

Presidential Address

There has recently been published an account of a new business developed at Hollywood by which the control of the financial affairs of the actors is entrusted to management companies These relieve the previously struggling artist of the responsibilities which go with an increase of his income to one or two hundred times what it formerly was "They can forget home, business, and personal worries" The star turns over all pay checks The firm works out a scientific budget and makes him adhere to it If he wishes to give a reception costing several hundred dollars over his weekly budget he is told that he cannot do it Help is hired and discharged by them and they take care of all bills and investments They obtain prices from several dealers and buy advantageously Considerable time is given to looking after his relatives "Anybody in Hollywood who is not keeping at least a half a dozen families is hardly a star" His personal expenses are neatly budgeted often as low as Fifty Dollars a week out of a salary of Two Thousand Dollars But they humor their clients as much as they can and provide for their future The hope is that when the stars cease to be great they may not have to struggle for work as extras We happened upon this modern note after our talk was planned and substituted it for the ancient poetry originally set down as a suggestive introduction

When John married Mary she was noted among her friends as a great cook Her mother had trained her to cook She was a fine seamstress, too, and John was very proud of their grand meals, and dainty linens with their hemstitching and embroideries John enjoyed working about the house and he chopped wood, mowed the lawn, raked leaves, and trimmed the flower beds It was not many months before there dawned upon him the impression that all was not well *within* the home The food was delicious (even on their limited budget), her rejuvenated left-overs were appetizing, her vegetables and desserts were luscious, and the table appointments perfect How ever, the closets were always in disorder, shoes scattered about, and it was often difficult to find something he needed, when hidden in a pool of lingerie. Then there was the little room which they planned for his "den" or "study!" After six months it was still piled with boxes and baskets and blankets and clothing and numberless little and big affairs that Mary had brought from home to add to their possessions—none es sential to every day living—but needed to be classified and placed where they belonged. When John gently suggested that they must get that room in order Mary was cross for the very first time No "den" for months more! When the laundry was done or sent some of John's essentials were often forgotten and he did emergency shopping using money he had planned for something else—usually something to please Mary! If there is anything which enrages an adoring husband it is his wife's upsetting his secret plans to delight her!

Working on a strictly cash basis Mary would let a bill go because she had no change, and many little delinquencies came home to roost weeks afterward She would lack some essential for housekeeping at critical moments and somebody, usually John, had to walk or run downtown and secure them Mary never saw dust, or dirt, or disorder except in the dining room and bed-room These were always in perfect order! Twenty years and more we followed Mary and John—and Mary never excelled in general management. She was a talented cook and an artistic seamstress She was a specialist! She and her husband were happy together, they prospered, but their home even with servants to help, was never what it might have been It lacked that thoughtful correlation of all essential factors into a com-

Read at the Annual Dinner, Rensselaer County Medical Society, Troy December 15 1937

we should sometimes *ask ourselves* if we are using general management in our cases to the full therapeutic degree

* * *

It is in *life* itself that we see the magnified importance of general management and that general management should begin its efficiency about the time the new baby has its first bath Someone has said "Give me a child during the first five years and I will determine his character and industry"

We shall not discuss the tremendous field suggested What should interest *us physicians* and the gentle martyrs who patiently companion us, is the general management of body and mind of ourselves and our patients which will make life most healthy, efficient, comfortable, and happy, a life of physical liberty—not license—and one that can be viewed in retrospect at any point with serene content We can best contribute to this end by a continuous program of preventative medicine especially that feature which gives us a long-handled lever to regulation—the Periodic Health Examination

We are familiar with the very modern fashion of taking the baby or the small child to the physician monthly or bi-monthly for examination, checking up weight and nutrition and the giving of general guidance The outgrowth of this excellent regime among the intelligentsia has been the well-baby clinics in Hospital Dispensaries and Municipal Health Centers Did you ever compare the children in one of these clinics with the average child of the tenements *before* there were such clinics? The contrast is amazing!—so is the mortality among children today as compared with thirty years ago, especially in the large cities! These well-baby inventories with advices have had a tremendous influence, all agree Then why not the same process for ourselves, our partners, our athletic youths, and flowering maidens?

This Periodic Health Examination is not only material insurance for the examinee but affords him the opportunity of calm intellectual consideration with the physician of physical and nervous conditions while he is apparently in good health Little ills can be swept away by a few general directions or trifling therapeutic procedures The direct object of these annual or semi-annual audits is, of course, the preservation of Health This is accomplished by recording the normal and abnormal conditions found and giving instructions so that the abnormal may be eliminated before physical or mental handicaps ensue.

Carlyle once wrote "The healthy know not of their health—but only the sick. This is the physicians' aphorism and applicable in a far wider sense than he gives it" Perhaps he was *suggesting* Periodic Health Examinations!

It remained for Voltaire to become even more suggestive in the remark that "The fate of a nation has often depended on the good or bad digestion of a Prime Minister"

Aside from their peculiar and impressive benefits to the individual examinees there are certain by-products which recommend these inventories to the mind of the earnest scientific physician Of these by-products we have elsewhere spoken and written and we would feel complimented if you will read of them in the January 15 JOURNAL [page 127]

Thus we can conclude that, regardless of the priceless value of the diagnosis and treatment of disease which we now largely practice because of the urgent demand of the public and our own intense interest, prevention is a larger and more fruitful field in the *general management of life* The scope of this prevention was suggested in an address to the House of Delegates at Rochester (1937), and a review of this may be of advantage tomorrow or soon Some of it lies in the domain of Health Department action This should excite our interest, not the disposition of it with a "Let George do it" gesture For Health Departments need our cooperation as urgently as we need theirs, and in our own State as well as in many others the mutual endeavors are ideal Current cooperation is making health history We should be constantly urging proportionately greater appropriations for Health Departments for most of the physician employees are grossly underpaid besides having such niggardly sums with which to work as to tax their utmost ingenuity and wisdom to say nothing of health The disproportions of appropriations can be illustrated by a page of recent history in New York City For years there has been an agitation for a change in the Fire Department from the two platoon system to the three platoon system This

the essential service without compensation This type of procedure may seem to help the hospital overhead but it embitters the neighborhood physicians and this unfavorable reaction spreads to members of the staff and engenders unpleasant, defiant outbreaks in the Halls of Medicine With physician management the disadvantages to everyone concerned, including the pauperizing of otherwise self-respecting people, would be clearly seen and except for needed emergency care patients would be referred to their family physicians

There is no field today, except some governments, that would extend its usefulness more vividly by improved general management than that occupied by the general hospitals However, it requires leadership, even statesmanship, among medical men

* * *

When physicians come to respond to the demand for their help by those who are ailing we meet with certain difficulties We once cared for a high-born lady whose prides were her social position, her clothes and her self-will She had dispensed with her husband She ate what she liked, never exercised, played bridge without mercy, and was always in trouble with somebody To use her own words she "lived on excitement" Periodically she had severe attacks of toxic migraine (headache) as agonizing as we have ever observed, with violent gastric protestations, which had been daily gathering force since the last attack

Her only use for the physician was during such an attack Then she was too ill to advise regarding anything but immediate relief As soon as relief arrived she reported well and resumed her turbulent campaign of uselessness After a few years of this she suffered an especially intense and prolonged seizure, and begged for *any* measure tending to prevent her suffering We agreed to call upon her the day after the attack was over and outline a regime expected to help her in time She permitted us to call when she was still limp and pallid—and expecting her to be clay in the hands of the potter, we outlined a regime of diet, water drinking, and exercise, quite different from her habits We read from the outline carefully prepared for her She listened, received the paper tore it up at once and said, "Doctor, you know I will not do any of these things I do not care to eat slops—I won't drink water, it's inconvenient, and as for a daily walk and the calisthenics, I won't bother,—give me some medicine and *let* me get well" That lady needed very little medicine. She needed a *regime of general management*

Lacking appreciation of the importance of general management, many people slip into ghastly conditions They will conscientiously take all the medicine we will prescribe, they will accept surgery with grace and without any or much question, but ask a frail lady with arteriosclerosis and chronic cold feet to wear woolen stockings by day and bed-socks at night and see her face curdle! Or advise a merry jocular cardiac gentleman to cease smoking and note the severe contour of his jaw! Or urge Mrs Plumpity to eliminate sugars, cream, mayonnaise, and pastry from her diet and note the sudden pallor and shock of desperation! The values of *sleep, rest, fresh air, exercise,* the needed *ration of fluid,* the *dietary* fitted to the expenditure of heat and energy, are recognized theoretically by almost all intelligent persons—but if the physician prescribes these things in proper doses and at the best hours they feel that he has departed from his science, and trodden upon treasured possessions all their own. Whereas the *general management* of most cases, whether bed-fast or ambulatory, is of such importance that without it much medical and surgical care is unduly prolonged or unsuccessful The modern serum treatment of pneumonia is urged only *added* to adequate nursing, plenty of fresh air (or oxygen), rest and sleep, and ideal hygiene Obesity, a real disease, needs only dietary adjustment and exercise except in endocrine cases Moreover, obesity is the largest single cause of diabetes The *early* nephritic or cardiovascular needs regulated diet, water drinking, rest, and exercise more than he needs medicine Give him medicine and let him otherwise run wild, and he is badly treated Many of the commoner forms of modern physiotherapy can be classified as general treatment massage, passive exercise, hydrotherapy, and others

Thus while we seek to elevate the standards of practice one of the momentous duties of physicians and their ladies is the education of the public in the value of *general management* of illness great and small As we seek to teach others perhaps

we should sometimes *ask ourselves* if we are using general management in our cases to the full therapeutic degree

* * *

It is in *life* itself that we see the magnified importance of general management and that general management should begin its efficiency about the time the new baby has its first bath Someone has said "Give me a child during the first five years and I will determine his character and industry"

We shall not discuss the tremendous field suggested What should interest *us physicians* and the gentle martyrs who patiently companion us, is the general management of body and mind of ourselves and our patients which will make life most healthy, efficient, comfortable, and happy, a life of physical liberty—not license—and one that can be viewed in retrospect at any point with serene content We can best contribute to this end by a continuous program of preventative medicine especially that feature which gives us a long-handled lever to regulation—the Periodic Health Examination

We are familiar with the very modern fashion of taking the baby or the small child to the physician monthly or bi-monthly for examination, checking up weight and nutrition and the giving of general guidance. The outgrowth of this excellent regime among the intelligentsia has been the well-baby clinics in Hospital Dispensaries and Municipal Health Centers Did you ever compare the children in one of these clinics with the average child of the tenements *before* there were such clinics? The contrast is amazing!—so is the mortality among children today as compared with thirty years ago, especially in the large cities! These well-baby inventories with advices have had a tremendous influence, all agree Then why not the same process for ourselves, our partners, our athletic youths, and flowering maidens?

This Periodic Health Examination is not only material insurance for the examinee but affords him the opportunity of calm intellectual consideration with the physician of physical and nervous conditions while he is apparently in good health Little ills can be swept away by a few general directions or trifling therapeutic procedures The direct object of these annual or semi-annual audits is, of course, the preservation of Health This is accomplished by recording the normal and abnormal conditions found and giving instructions so that the abnormal may be eliminated before physical or mental handicaps ensue

Carlyle once wrote "The healthy know not of their health—but only the sick. This is the physicians' aphorism and applicable in a far wider sense than he gives it" Perhaps he was *suggesting* Periodic Health Examinations!

It remained for Voltaire to become even more suggestive in the remark that "The fate of a nation has often depended on the good or bad digestion of a Prime Minister"

Aside from their peculiar and impressive benefits to the individual examinees there are certain by-products which recommend these inventories to the mind of the earnest scientific physician Of these by-products we have elsewhere spoken and written and we would feel complimented if you will read of them in the January 15 JOURNAL [page 127]

Thus we can conclude that, regardless of the priceless value of the diagnosis and treatment of disease which we now largely practice because of the urgent demand of the public and our own intense interest, prevention is a larger and more fruitful field in the *general management of life* The scope of this prevention was suggested in an address to the House of Delegates at Rochester (1937), and a review of this may be of advantage tomorrow or soon. Some of it lies in the domain of Health Department action This should excite our interest, not the disposition of it with a "Let George do it" gesture For Health Departments need our cooperation as urgently as we need theirs, and in our own State as well as in many others the mutual endeavors are ideal Current cooperation is making health history We should be constantly urging proportionately greater appropriations for Health Departments for most of the physician employees are grossly underpaid besides having such niggardly sums with which to work as to tax their utmost ingenuity and wisdom to say nothing of health The disproportions of appropriations can be illustrated by a page of recent history in New York City For years there has been an agitation for a change in the Fire Department from the two platoon system to the three platoon system This

has recently been voted and approved by the Legislature

We are informed by credible authority that this change, involving the employment of fifty per cent increase in the number of firemen, provides for an added appropriation for the Fire Department which exceeds the entire appropriation for the Health Department. You can rebuild houses! Should we watch undisturbed the destruction of human lives because of scrimping appropriations? Tax payers *can* be made to understand the need for greater appropriations for health work Henry Vaughan has done it with the cooperation of the Wayne County Medical Society in Detroit

Thus it appears that *our* contribution to the essential *general management of life* can be immediately expanded by employing a broader concept of our duties which embraces the prevention of injury and disease enthusiastic education of the public in the desirability and value of prevention especially through Periodic Health Examinations, the re-preparation of ourselves to fully meet the demand we create, and the provision for ourselves and our families of such preventive measures as will make our public envious and clamor to be in style and up-to-date. This will naturally involve some alterations of *our* conduct for we must all abide by the judgments and directions of our Periodic Health Examiner and report for record every six months The results would be astonishing to most of us

Without swerving from our magnificent purposes in life we could fulfill these purposes more efficiently and dodge many little uncomfortable handicapping ills Moreover we could sidetrack cerebral accidents and coronary thromboses which now deplete our ranks with increasing frequency and distressing discrimination

It seems particularly consistent and important for us the physicians of this fascinating perilous day to thus *emphasize in precept, practice, and example the general management of life itself* through Preventive Medicine

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Low Mentality

Some years ago, during a strike of coal miners in Pennsylvania, when the local physicians were intimidated by the employers' agents and secretly forbidden to take care of the strikers and their families, an appeal was made by the workers' committee to distant physicians And one New York doctor volunteered to serve freely for several weeks as a general practitioner—internal medicine, minor surgery, etc It was a dangerous business, since the masters' men, all powerful, controlled the countryside and waylaid anyone who helped the strikers He was fully rewarded, however, by learning who those miners were and how they lived He saw many of them, every day in a different town or camp He received his patients, in most cases, in some tent, or shack, while a long line of them was extending outside into the field. To be sure, he was unable to do anything to remedy their insufficiency of food or their lack of shoes and so the value of these consultations was quite limited This is not the place to go into details, which were all extremely interesting The one outstanding fact was that the majority of these hard-working men and women of foreign origin had, in spite of their bitter poverty, enormously *large families* Some enjoyed or were hampered by as many as fourteen or more children and the couples who, before the age of thirty, had six, were not rare *Mortality among the offspring was high, but mental deficiency was comparatively even higher* There was profuse quantity, but poor quality—a fact from which we should learn a lasting *lesson in preventive medicine*

Not only the workers were affected by the strike, but the small dealers and shop keepers of the entire region as well They, although slightly better off financially, were not far removed from their customers and were just as prolific as the latter Several of these people, the most impoverished of them, came to see the city physician

In one especially afflicted family, where the father, a store owner, was dull himself,

one-half of the children had been more or less below normal Fortunately for them they were physically just as unfit and all the mentally deficient ones but one died.

This child, otherwise in good health, was brought to a New York mental hygiene clinic years later The family meanwhile had established itself in a town close to the Metropolitan area

An Italian girl of twelve, then, comes with her mother and makes an excellent impression.

She happens to be pretty and, at the first glance, her eyes betray intelligence Or are we bribed by her beauty? Who knows, by the way, how often we are unjust to bright people who are homely?

But what bitter disappointment when she opens her perfect mouth!

It is a so-called "borderline" case She is *much behind in school, plays with children a good deal younger than herself* She knows well those things that have been repeated to her many times She is always trying to guess—unsuccessfully—but never attempts to understand the question She spells "nkot" for "knot" because she knows that these letters are components of this word, but she does not care how the letters are arranged "Leatst" stands for 'latest", "mnoutain" for "mountain", "frineds" for 'friends", "ym" for "my", "swa" for "was", "scaer" for "scare", "readres" for "readers", "theet" for "teeth", "seplling" for "spelling" Also "wouan" and "wonan" for "woman", "swept" for "sweet", "autonbile" for "automobile" Where she has forgotten what letters the word contains, she ignores them

She is a *quiet, submissive* type Playful, happy

Mother says she *never asks questions*

The small problems, as, where to hang her overcoat in the room, how to buy a pair of shoes (her mother planned to go to a shoe store on the same day), are difficult to solve.

The medicine closet in the Clinic is a "bureau" Asked why the closet has glass doors, she says "because windows"

She owns five pairs of shoes Asked how many single shoes it makes, she says "nine" But one can see she is guessing, not figuring

Asked how long it took her to come to the hospital from her house, she cannot answer When asked how many hours, she says 'three" And when her mother protests, she says "four" Again only guessing

She is always looking to the mother for approval or disapproval

One gains the impression that to ordinary things in life she applies her school method learning by heart, guessing Whenever she is unable to do so she gives up

A letter from school states that patient's mental age is "seven", her IQ 85

Before going further I wish to remark that the phrase or expression *"mental age'* is erroneous and misleading and should be abolished A child of seven is usually highly intelligent and mentally very alert, indeed much more so than the average adult and also perhaps more so than he himself or she herself will be later in life The only superiority of the older person consists ot the advantage gained by experience and training, which really correspond to mental culture, in the same sense as body strengthening is acquired by physical culture. Now culture undoubtedly improves the mind and it may broaden intelligence, but not always so It is certainly unfair and a great mistake to say that a deficient or 'borderline" child of twelve or a semi-moron of twenty or of any age may be compared to a mentally normal child of seven or of whatever age

There is but little to be done in a case of this sort Nothing in the world can give this girl the intelligence with which she has not been endowed by nature. In the course of the years some training will help, she will learn a few things, but she will never amount to anything worth while

We should warn the parents about the dangers lurking in the rapidly oncoming adolescence, particularly in a child who is physically so attractive

And, seeing that the mother, who is of average or adequate intelligence, in her great desire to enhance her daughter, is giving her instructions which can never have any effect it is our duty to explain to her what a child of this sort must learn

This mother is committing the error of supplementing at home the schooling to which her girl is so indifferent She is teaching her spelling, arithmetic and other academic subjects which mean nothing to a mentality of this kind

A backward child should learn the *practical things* that it will need to know like buying something in a store, taking and giving change, dressing and undressing, easy work in the house, names of common objects, how to go about town and soon and if necessary and possible, to earn a living by some simple trade

611 W 158 St

"Insomnia is nothing to worry about," according to a physician Maybe not, but we always lose a lot of sleep over it—*St Louis Star-Times*

Medical Care for All the People

(Leading Editorial, reprinted from the Journal of the American Medical Association, January 15, 1938)

Under the leadership of many county medical societies, with the approval of the state medical societies and in accordance with the actions of the House of Delegates of the American Medical Association, definite provisions for medical service to the indigent and to those partially able to pay have already been established in various parts of the country Hundreds of such plans have been reported to the Bureau of Medical Economics of the American Medical Association and many of them have been described from time to time in considerable detail in the Organization Section of *The Journal* In the state of Pennsylvania seventeen counties now have such plans actively in effect In the state of Iowa many county medical societies have taken over completely the medical care of the indigent In Kansas, in California, in Michigan, in Missouri and in many other states, plans already functioning seem to have solved to a large degree the question of preventive medicine and medical care for the people covered by these plans

At its annual session in June, 1937, the American Medical Association reaffirmed its willingness to do its utmost today, as in the past, to provide adequate medical service for those unable to pay either in whole or in part for medical care. At that time the American Medical Association also officially reaffirmed its willingness, on receipt of direct request, to cooperate with any governmental or other qualified agency and to make available the information, observations and results of investigations together with any facilities of the Association The Social Security Board, the United States Public Health Service, the bureau devoted to maternal and child welfare in the Department of Labor, and many other government bureaus, commissions and agencies are known to be engaged in studies of health services which may yield information of importance in planning for the future Thus far no call has come from any governmental agency for the cooperation of the American Medical Association in studying the need of all or of any groups of people for medical service, or to determine to what extent any considerable proportion of our public are suffering from lack of medical care

At the meeting of the American Public Health Association, held a few months ago in New York City, an address was

made by Miss Josephine Roche, third assistant secretary of the treasury and in charge of the United States Public Health Service, in which she emphasized to that organization the importance of determining and meeting as soon as possible the actual needs of the indigent and of those partially indigent in relationship to medical care Moved perhaps by her appeal, the American Public Health Association appointed a committee to confer with the Board of Trustees and the officers of the American Medical Association with a view to stimulating medical organizations everywhere toward greater activity in this matter That committee met with the Executive Committee of the Board of Trustees of the American Medical Association in Chicago late in December As a result of that conference the following resolutions were adopted by the Board of Trustees

> WHEREAS, A varying number of people may at times be insufficiently supplied with needed medical service for the maintenance of health and the prevention of disease, and
>
> WHEREAS, The means of supplying medical service differ in various communities, be it
>
> *Resolved,* That the American Medical Association stimulate the state and county medical societies to assume leadership, securing cooperation of state and local health agencies, hospital authorities, the dental, nursing and correlated professions, welfare agencies and community chests in determining for each county in the United States the prevailing need for medical and preventive medical service where such may be insufficient or unavailable, and that such state and county medical societies develop for each county the preferable procedure for supplying these several needs, utilizing to the fullest extent medical and health agencies now available in accordance with the established policies of the American Medical Association Be it further
>
> *Resolved,* That the Board of Trustees of the American Medical Association establish a committee to cooperate with the Bureau of Medical Economics in outlining the necessary procedures for making further studies and reports of the prevailing need for medical and preventive medical services, and that the Secretary of the American Medical Association arrange to develop such activities through the secretaries of state and county medical societies in each instance, urging the formation of special committees in each county and state where committees are not available for this purpose.

The undertaking proposed by this resolution is an attempt to apply on a nationwide scale the best features of the numerous plans already in effect, utilizing in each county to the fullest extent the resources there available Thereby it becomes possible for the organization to act specifically as a clearing house in the initiation, development and functioning of what may well evolve into a comprehensive system of medical care for all the people according to the American plan of medical practice

---

Realism in Government

Governor Lehman's voice has been raised more than once during the past year in favor of governmental self-restraint His Jackson Day address again gives hope that as long as he remains in office New York State will not overstep its proper functions—in medicine or anything else

Mr Lehman holds to the time-honored creed of this country, viz, that government should be the servant and not the master of the people The principle of compulsory sickness insurance, by which the state establishes rigid control over the people in one of their most intimate concerns is wholly alien to the American tradition

Speaking of political party, which he likens to government, Mr Lehman declares, "It must be sensitive to the needs of the people—open-minded but not visionary— progressive but not impractical, and finally it must be responsive to the realities of today and the hopes of tomorrow, as well as to the traditions of yesterday" These words describe everything that the adherents of compulsory sickness insurance are not

From the time the health insurance bug bites a politician, he becomes incapable of viewing it or anything pertaining to it clearly He closes his mind to international morbidity and mortality rates, which clearly demonstrate the superiority of independent practice He refuses to face the staggering administrative expense, the red tape, the bureaucratic muddling which make it impossible for obligatory insurance systems to deliver high grade medical service at low cost

We need realism, as Mr Lehman says—in government, in social leadership, and in medicine—and the proposal of compulsory sickness insurance for this country is anything but realistic It fails to take care of the large number of indigent and unemployed who are our greatest problem It does not even provide for all workers in the low-income class. It raises the cost of living and lowers the standards of medical care—a combination doubly dangerous to health

Speak Up, Mr President

The weeks are slipping by and no food and drug bill has made its appearance in Congress Unless some one with influence takes the initiative, there is danger that this important legislation will be lost in the press of larger political issues

It would be entirely compatible with President Roosevelt's interest in public health if he gave the necessary push to start a suitable control bill on its way There are plenty of Senators and Congressmen who would be willing to introduce such legislation under the aegis of Presidential approval Mr Roosevelt is a good fighter for anything in which he believes Surely he must recognize the need to prevent a repetition of the country's tragic experience with "Elixir Sulfanilamide"

The deaths attributed to the latter have served to focus public attention on the inadequacies of existing food and drug legislation Actually they represent only a fraction of the annual mortality from dangerous and useless nostrums Many preparations which do not kill outright are guilty in an indirect way Their advertisements, promising impossible cures, persuade the ignorant to delay authentic treatment until it is too late.

Some manufacturers who would hesitate to do physical injury think nothing of robbery They charge anywhere from a dollar to ten for a cheap product—worth ten or fifteen cents or even less—which cannot possibly perform what they promise for it This is not fair trade, on which the President lays so much stress

Once a control bill reaches Congress, it will face a stiff fight The drug and cosmetic lobbies have strong allies in both Houses There will be little chance of enacting a vigorous law at the present session unless it is introduced soon, so that public opinion has time to make its influence felt

No legislation is closer to the health and welfare of the average man than an adequate food, drug, and cosmetics control law None is more necessary to his safety In the absence of other responsible leadership, President Roosevelt should bring his great influence to bear in favor of such a measure.

Prophylaxis of Measles

While the mortality from measles in itself is not high, the pulmonary complications which so frequently accompany it makes it rank as one of the most serious diseases of childhood The usual methods of prophylaxis are often of little avail

because of the prolonged period of incubation During this stage of invasion, measles can be rapidly disseminated through contact Unfortunately, there still exists, among the greatest portion of our population, the misconception that measles is just one of those things that every child has to have Many parents deliberately expose their children to definite contacts simply to "get it over with"

The efforts which have been exerted by the medical profession in its endeavors to control the ravages of pneumonia have included the prevention of all conditions which predispose to its occurrence While no specific prophylactic measure is at present available for measles, it has been demonstrated that convalescent or immune serum is highly effective as a means of lessening the incidence of this disease From a comprehensive survey of this subject, Hyland and Anderson[1] have shown that measles can be prevented among the greatest proportion of contacts Of over three thousand cases which had been exposed to measles in schools and hospital wards, 83 9 per cent escaped the disease entirely following the administration of convalescent serum The others who contracted measles exhibited an attenuated form of the disease in all but 2 6 per cent of the patients studied What is of the utmost significance, however, is that pulmonary complications were limited to only *seven* among the 3,610 cases who had been given serum as a preventive, whereas in the control group of 626 cases, fifty-three complications and nine deaths occurred

Hyland and Anderson feel that the prophylactic value of convalescent serum definitely has been established While whole blood can be used, serum alone is preferable because of the smaller dosage required and the avoidance of a hematoma at the site of injection The use of immune adult serum, while not as effective as the convalescent serum, should be resorted to as a preventive measure at such times when the latter is not readily available

1 Hyland C. M and Anderson L R. *Arch. Pediat* 54 653 1937

The Endocrine Factor in Eclampsia

The etiology of eclampsia still remains one of the unsolved problems in gynecology Many theories have been advanced for its appearance during the later stages of pregnancy, among the most prominent of which has been that explanation based on an impairment of renal function Others have held to the opinion that the eclamptic state is the result of the liberation of toxic substances during the period of gestation None of these premises, however, has supplied the answer to the prophylactic aspect of this question

The intense interest which has been manifest in recent years concerning the role of the endocrine glands in the functional activity of the female genital organs has stimulated workers in this field to investigate the relationship of the organs of internal secretion to the incidence of the toxemias of pregnancy Baer[1] and Pardy[2] demonstrated an increase in the basal metabolic rate during the later months of normal pregnancy Plass and Bogert[3] have shown that a diminution in the plasma proteins occurs in the toxemia of pregnancy—a condition which likewise can be induced by abnormalities of the endocrine system These reports tend to confirm the belief that an endocrine imbalance may be the responsible factor in the production of eclampsia

Recently, moreover, Vorzimer, Fishberg, Langrock, and Rappaport[4] have studied this subject from the clinical aspect In a group of unselected patients, these investigators have determined that women who have stigmata of endocrine disturbance are very prone to develop a toxemia during pregnancy A tendency

Speaking of political party, which he likens to government, Mr Lehman declares, "It must be sensitive to the needs of the people—open-minded but not visionary— progressive but not impractical, and finally it must be responsive to the realities of today and the hopes of tomorrow, as well as to the traditions of yesterday" These words describe everything that the adherents of compulsory sickness insurance are not

From the time the health insurance bug bites a politician, he becomes incapable of viewing it or anything pertaining to it clearly He closes his mind to international morbidity and mortality rates, which clearly demonstrate the superiority of independent practice He refuses to face the staggering administrative expense, the red tape, the bureaucratic muddling which make it impossible for obligatory insurance systems to deliver high grade medical service at low cost

We need realism, as Mr Lehman says—in government, in social leadership, and in medicine—and the proposal of compulsory sickness insurance for this country is anything but realistic It fails to take care of the large number of indigent and unemployed who are our greatest problem It does not even provide for all workers in the low-income class It raises the cost of living and lowers the standards of medical care—a combination doubly dangerous to health

Speak Up, Mr President

The weeks are slipping by and no food and drug bill has made its appearance in Congress Unless some one with influence takes the initiative, there is danger that this important legislation will be lost in the press of larger political issues

It would be entirely compatible with President Roosevelt's interest in public health if he gave the necessary push to start a suitable control bill on its way There are plenty of Senators and Congressmen who would be willing to introduce such legislation under the aegis of Presidential approval Mr Roosevelt is a good fighter for anything in which he believes Surely he must recognize the need to prevent a repetition of the country's tragic experience with "Elixir Sulfanilamide"

The deaths attributed to the latter have served to focus public attention on the inadequacies of existing food and drug legislation Actually they represent only a fraction of the annual mortality from dangerous and useless nostrums Many preparations which do not kill outright are guilty in an indirect way Their advertisements, promising impossible cures, persuade the ignorant to delay authentic treatment until it is too late.

Some manufacturers who would hesitate to do physical injury think nothing of robbery They charge anywhere from a dollar to ten for a cheap product—worth ten or fifteen cents or even less—which cannot possibly perform what they promise for it This is not fair trade, on which the President lays so much stress

Once a control bill reaches Congress, it will face a stiff fight The drug and cosmetic lobbies have strong allies in both Houses There will be little chance of enacting a vigorous law at the present session unless it is introduced soon, so that public opinion has time to make its influence felt

No legislation is closer to the health and welfare of the average man than an adequate food, drug, and cosmetics control law None is more necessary to his safety In the absence of other responsible leadership, President Roosevelt should bring his great influence to bear in favor of such a measure

Prophylaxis of Measles

While the mortality from measles in itself is not high, the pulmonary complications which so frequently accompany it makes it rank as one of the most serious diseases of childhood The usual methods of prophylaxis are often of little avail

in the name of Medicine, in the name of Humanity, immediate action is demanded Get busy, Doctor! Get busy now! Don't stop until you reach your representatives and your senators down in Washington, D C Begin with your alderman and keep on going! Educate them Explain to them Let them know what they are doing Like the man in the traditional early American story, try a little 'moral suasion' "—The editors of the *Illinois Medical Journal* for January wish their readers a Happy New Year with the above suggestions, which we think are very wise

"THE FIRST 'NATIONAL CONGRESS of the German National Health Movement' was held recently at Düsseldorf In attendance were several thousand members of German societies which advocate living habits and medical practice in conformity with nature Kees, director of the league of heilpraktiker (lay practitioners), spoke in a characteristic manner All regular medical procedures, he said, were products of the 'bare' intelligence, whereas the procedures of nature medicine were rooted in the soul, in the emotions "—The Berlin Correspondent to the *J.A.M.A.* under date of January 8, informs us of "Developments in the National Health Movement" now in "progress" in Germany

"I HAVE A BETTER FAITH IN the millions to come I cannot but believe that they will make the most of the lively possibilities of the new metals, new plasters and pastes and plastic substances, that are being put into their hands Even if there are disasters and crashes ahead, I think this new everyday life of greater spaciousness, more light, more health, longer years, wider interests, will come about "—H G Wells, peering into the future, voices considerable hope in his article to be found in *The New York Times* of January 16

DOUBTS ABOUT PRENUPTIAL EXAMINATIONS

The rising tide of state laws requiring prenuptial medical examinations prompts Dr Young of the *Urologic and Cutaneous Review*, to observe that while "the average person probably accepts a certificate as a guarantee of safety," yet "it is obvious that it is nothing of the sort Active disorders may be readily diagnosed, but such is not the case with latent infections Here there is not only room for an honest difference of opinion as to whether or not an infection has been cured, but the patient may appear for examinations during a period of remission of symptoms and may lie when questioned. Infection after examination is a possibility Hence a medical certificate is of variable value The fact that the public does not realize this constitutes a legal danger for the physician issuing a certificate Care in the wording of any statement issued is an important precaution

There are practical difficulties in the way of giving a valid opinion A series of tests over a considerable period of time may be necessary, yet neither the time nor the money to pay for such an extended examination may be available Berlin and Vienna offer free prenuptial consultation to meet this problem Evasion by various extra-legal means may prevent the application of the law to many unions

There are large numbers of young people who have never thought of an examination and accept the law willy-nilly It is these heedless ones who gain most from such limited protection as a medical certificate gives This is the group which needs education most if the purposes of the law are to be fulfilled Fortunately these young people can be educated with a minimum of effort and a maximum of coverage. They, one and all, consult a physician, the very person best equipped to explain to them the medical aspects of marriage This lays a responsibility upon every member of the medical profession, but a responsibility which can and will be met easily and gladly for the increase of human happiness

FRACTURE DAY"

"Fracture Day," under the auspices of the New York and Brooklyn regional fracture committee of the American College of Surgeons, will be held February 25, 9 30 A M to 4 30 P M at the Lenox Hill Hospital, New York City

All members of the medical profession interested in fractures are invited to attend For complete information regarding program, etc, address Herbert M Bergamini M D, Secretary, 101 E 89 St, New York City

toward obesity, abnormal distribution of the hair, a thick-set stature, the absence of a gynecoid pelvis as demonstrated by roentgenograph and a lowered basal metabolism were found by Vorzimer et al, to be associated with an elevation in the blood pressure characteristic of a pre-eclamptic state In addition, the report of Savage and Wylie[5] indicates that in toxemia of pregnancy there is a definitely lowered level of esterin excretion in the urine as determined by the chemical test devised by Schmulovitz and Wylie[6]

Thus the preventive phase of eclampsia has been brought into the clinical field The recognition of these endocrine stigmata is possible by the ordinary physical examination The gravid woman who presents these factors should be carefully watched, and should be treated as a potential eclamptic. In prenatal clinics, she should be segregated for further investigation and proper therapy Vorzimer and his coworkers recommend measures directed toward dehydrating the patient and they have obtained splendid results in avoiding the appearance of eclampsia

CURRENT COMMENT

"STEADILY THE GRISLY TIDE of human slaughter rises In the hamlets, at the crossroads, on the highways, in the ether, under oceans,—man, the killer—looses his machines for wanton murder Some for Communism, some for Fascism, others for conquest, more just for the ride From familiar places stare the glazed and stony eyeballs of the dead In little hamlets, at the crossroads, on the highways, from the byways, stare the glazed, accusing eyeballs of the dead

"Is it because of advanced education and progressive civilization that we condemn the bombing of non-combatants in other countries and neglect the slaughter of equally innocent civilians on our own highways? Is the citizen any less dead who dies by benefit of motorcar, or by virtue of the fact that his killer is a compatriot dedicated to the cause of peace, the support of foreign missions, who can read and write?

"Insofar as the operation of motor vehicles involves the physical and mental fitness of the front-seat murderers, can organized medicine not lend a hand in answering the too-silent appeal of those glazed, accusing eyeballs of the dead?"—After reading the above "Man, The Killer" in the January issue of the *Westchester Medical Bulletin*, we were unable to refrain from quoting it in its entirety

"SINCE COMPULSORY MEDICAL EXAMINATION has failed in European countries, no one desires to attempt it in this country but the habit of voluntary annual physical examinations can be brought about with relative ease by a popular education of the masses I have learned from the statistician of the association of the Life Insurance Presidents, that in 1936 there were no less than 64 million policy holders in the United States A thorough physical examination was required from every applicant Since Surgeon General Parran started the anti syphilitic crusade, thousands of men and women have voluntarily submitted to the diagnostic test for syphilis A start should be made with all employees of federal, state, and city governments, insurance companies should further insist upon physical examinations every year, employers of large or small bodies of men should urge these examinations for their own interest as well as that of the employees Colleges, schools, and other institutions of learning, should have annual physical examinations These periodic surveys will soon become a national habit

"The need of the hour is a united progressive medical profession with enough of the nation's wealth to further the nation's health and as pointed out before, to make us physically, mentally, morally and spiritually, and economically strong, eager for peace but prepared to defend it"—From a paper by S Adolphus Knopf, M D, to be found in *Medical Record* of January 5

"THE PROMOTION AND DISSEMINATION of medical knowledge throughout the state remains our important function"—Sir William Osler said this some time ago and it still is a vital truism today

"ALL OVER THE UNITED STATES, with this incoming year, are assemblying those bodies of men who have been elected by taxpayers all over the country to dictate the ways of government, the paths of citizenship, and the collection and the subsequent spending of the tiethes In the name of America,

5 Savage and Wylie *Ibid* 33 771 1937
6 Schmulovitz and Wylie *J Lab and Clin Med* 21 210 1935

health and medical services and activities The study of any subject, matter or thing adjudged by the commission to be relevant or germane to the subjects of inquiry hereunder shall be deemed within the scope of the investigation directed to be made by this act."

Assembly Int 35—Wagner, establishes state-wide system of health insurance to be administered by a board in the Labor Department, of five members appointed by the Governor, and appropriates $150,000 Referred to the Ways and Means Committee

Comment Only two of the five members of the Board to be appointed by the Governor are to be licensed physicians Each member shall receive a salary of $10,000 per year The board may appoint an executive director, district medical superintendent, and other necessary employees A fund for administration of the act shall be created principally by taxing employers "six per centum of the total of all wages periodically paid to employees plus one-tenth of the amount of such contributions which shall be appropriated annually to the fund by the state out of the state treasury"

"Employees sixty-five years of age or over shall be insured only for medical benefits and shall pay proportionately reduced premiums The employers, however, shall pay the usual premium due for full benefits"

Employees receiving twenty dollars a week or less shall not contribute amounts greater than one per cent of their wages If wages are in excess of twenty dollars but not exceeding forty dollars, they shall contribute not more than two per cent. Employees' contributions are to be taken from their wages by the employers Full benefits shall be termed "health insurance benefits" and include cash, maternity and medical benefits Medical benefits shall consist of "(a) The service of a physician in general practice at the office, home, hospital, or elsewhere, in preventive, diagnostic, and thereapeutic treatment and care, which shall include immunizations and periodic physical examinations, (b) On the prescription of the physician in charge, and the approval of the district medical superintendent,

1 General and special hospital treatment and care which shall include nursing and the other usual hospital services

2 Prenatal and maternity treatment and care in the home or in the hospital

3 The services of a surgeon, diagnostician, or other specialist at the office, home, hospital or elsewhere

4 The service of laboratories and clinics

Provision is made for voluntary insurance by persons "not employed in an employment within the definition of this article and not over sixty-five years of age who is dependent upon his earnings which average sixty dollars a week or less"

"(a) The board shall fix in each district the manner of remunerating physicians and dentists in general practice, surgeons, and other medical and dental specialists, pharmacists, nurses, hospitals, clinics, laboratories, and the other persons and agencies furnishing the medical benefits after consultation with the appropriate professional organizations in each instance. No mode of remunerating physicians and dentists in general practice shall be adopted for any local area within the state without the consent of a majority of such physicians or such dentists, respectively, in that locality, unless the majority of such physicians or dentists fail to agree upon any method of payment No mode of payment of the physicians rendering general practitioner service under this article shall be adopted in any district that does not involve the collective responsibility of the general practitioners, therein rendering insurance service for the general practitioner medical benefits prescribed in this article, (b) Any one of the following modes may be adopted for remunerating physicians and dentists in general practice

1 A salary system

2 A per capita system whereunder payment will be based on the number of persons entitled to medical benefits included in the practitioner's list.

3 A fee system whereunder payment will be based on the extent and character of the treatment given and services rendered by the practioner to persons entitled to medical benefits"

Bulletin No 2

January 17, 1938

Please set aside Wednesday, February 9, as a tentative date for the annual conference of County Society Legislative Chairmen As usual, the conference will be held at the Hotel Ten Eyck, Albany, beginning at ten o'clock and adjourning about 3 00 P M

New Bills Introduced

Senate Int. 117—Feld, defines roentgenology and radiology and limits practice thereof to certain qualified persons Referred to the Education Committee

Comment The several provisions of the bill are highly contradictory, making it absolutely impossible of enactment. This is

COMMITTEE ON LEGISLATION

Bulletin No 1

January 10, 1938

Already several bills that are of vital interest to us have been introduced

Senate Int. 99—Twomey, Assembly Int. 127—Newell, requires serological blood test for syphilis of pregnant women from sample taken by licensed physician and submitted to "approved laboratory," birth certificate to contain report of such test, and appropriates $15,000 Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Comment Mr Twomey and Mr Newell argue that if every pregnant woman were to receive a blood test early in pregnancy, treatment might be instituted and congenital syphilis prevented They realize that there will be plenty of instances where the patient will not see a physician until late or probably not until labor has begun, and that under those conditions congenital syphilis may not be prevented, but they believe that inclusion in the law of a measure of this kind will have a great educational value To include on the birth certificate a statement that a blood examination has been made we are informed will be accomplished in such way as not to violate the Confidential Communication Act Provision is made for securing specimens from women delivered by midwives or others not permitted to take blood specimens, by requiring that they "shall cause a sample of the blood of such pregnant woman to be taken by a duly licensed physician" The blood is to be examined at approved laboratories and an appropriation of $15,000 is carried to cover the additional expenses to the laboratory and the Department of Health

Senate Int 100—Desmond, amends the Public Health Law in relation to serological tests of expectant mothers "It shall be the duty of the physician attending a woman during pregnancy to cause a serological test for syphilis to be given such woman prior to the birth of the child If more than one physician attends her or is consulted by her during such period, each shall be responsible for complying with the provisions of this section unless and until some one of them shall have complied herewith" Referred to the Public Health Committee

Comment No provision is made for the examination of women delivered by midwives

Senate Int. 101—Desmond, Assembly Int 124—Breitbart, requires that marriage license application be accompanied with statement by licensed physician that applicant has been examined for syphilis not more than twenty days prior to application, unless judge or justice makes an order that same be dispensed with, and provides that no marriage shall be solemnized after 65 days from date of license Referred to the Health Committee in the Senate and the Codes Committee in the Assembly

Comment This is the bill that Assemblyman Breitbart has carried for two years, except for slight modifications

Assembly Int 34—Wagner, creates temporary commission of three Senators, three Assemblymen, and three persons appointed by the Governor, two to be licensed physicians, to study and recommend ways and means for minimizing risk of illness through extension of public health services, for medical care for indigent, for raising standards of medical practice, for using private institutions in allocatng public funds, etc., and appropriates $50,000 Referred to the Ways and Means Committee

Comment Eight suggestions for study by the commission are as follows "(a) proposals designed to minimize the risk of illness by increasing preventive efforts through extension of public health services, (b) proposals for furnishing adequate medical care for the medically indigent, the cost to be met from public funds, (c) proposals making available public funds for the support of medical education and for studies, investigations and procedures for raising the standards of medical practice, (d) proposals making available public funds for medical research in recognition of the need for maintaining high standards of practice in both preventive and curative medicine, (e) proposals making public funds available to hospitals which render services to the medically indigent and for laboratory, diagnostic and consultative services, (f) the utilization of private institutions in the allocation of public funds for any of the foregoing so long as the services rendered by them are designed to carry out the objectives of such program and the declared policy of the state, (g) the investigation and planning of the measures proposed by the commission and the direction and execution of such measures by persons expert in the work involved, and (h) proposals designed to effect adequate administration and supervision of the health functions of the state government and if deemed advisable the consolidation under a separate department of all federal and state

mate consumer as to its fitness Referred to the Judiciary Committee

Assembly Int. 272—Fitzpatrick, requires common carrier, railroad and omnibus line carrying passengers for hire, to carry first-aid kit for convenience of passengers Referred to the Public Service Committee

Assembly Int. 291—Breitbart, permits blood-grouping tests of criminals for identification purposes Referred to the Codes Committee

Assembly Int. 292—Breitbart, permits serologic blood test in criminal proceedings, if necessary to determine parentage of any child or identify any person or corpse, upon order of court Referred to the Codes Committee

Assembly Int. 334—Peterson, empowers peace officer to require person driving motor vehicle or cycle, whom he believes to be intoxicated, and within two hours after arrest therefor, to submit to examination by a physician to determine by blood and urine tests whether such person is intoxicated Referred to the Motor Vehicles Committee

Assembly Int. 339—Phelps, creates rehabilitation board for future care of released state hospital patients, provides for examination by three qualified examiners or psychologists before commitment to insane institutions, on whose certificate court must forthwith issue commitment order Referred to the Health Committee

Comment Changes the Mental Hygiene Law with regard to the mental examination of patients for commitment to or discharge from hospitals for the treatment of insane, by requiring that the qualified psychologist must be a practicing physician, and further provides that the commitment may be made on order of a justice of a court of record as well as a judge, and a certificate made by three qualified examiners instead of two The rehabilitation board shall consist of five members appointed by the Commissioner with the consent of the Governor and will include two qualified psychologists, two psychiatrists, and one social service worker

Action on Bills

Senate Int 100 Mr Desmond has amended his bill so that blood examinations will also be made on women attended by midwives or persons other than physicians

* * * *

The Committee, in conference on January 12, gave approval to the following bills

Senate Int. 99—Twomey—blood tests of pregnant women

Senate Int. 100—Desmond—as amended

Senate Int 101 — Desmond, Assembly Int 124—Breitbart, pre-nuptial examinations

Assembly Int. 157 — Hawkins — radiology

Assembly Int 236 — Schwartz — food labels

Assembly Int. 272—Fitzpatrick, first-aid kits

The Committee refused to approve Senate Int. 117—Feld, radiology, and considered Senate Int. 202—Stagg, Assembly Int 287—Shaw, provisions for care of poliomyelitis patients, as unnecessary

JAMES H BORRELL
B WALLACE HAMILTON
JOHN L. BAUER

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

MEMBERS OF THE Orange, Rockland, and Nassau County Auxiliaries were guests of the Kings County Woman's Auxiliary at their regular meeting held in the Kings County Medical Society Building on January 11 The attendance was large in anticipation of the unusually interesting program arranged by Mrs John L Bauer, Program Chairman

The guest speaker was Dr Chas H Goodrich, President of the Medical Society of the State of New York, who read a most interesting paper on "Beauty and Preventive Medicine." Discussion of Dr Goodrich's paper was followed by short talks by Dr Anna R Robinson, District Health Officer, on the work of the Health Centers and their cooperation with physicians and by Mrs Luther H Kice, Legislation Chairman of the Woman's Auxiliary to the Medical Society of the State of New York, who stressed the need for better understanding and interest by all members of the Auxiliary in legislative matters of vital importance to the medical profession

On behalf of the Executive Committee and the members of the Kings County Woman's Auxiliary, Mrs Edwin A Griffin, retiring President, was presented with a personal gift and a retiring presidents' pin by Mrs Thomas A Wood

A social hour followed the meeting

fully demonstrated by the following excerpts

"9-a 'Roentgenology' means the scientific application of x-rays by means of x-ray devices including the fluoroscope."

"9-b 'Radiology' means the diagnostic or therapeutic application to human beings of radiant energy including x-rays, radium, ultraviolet rays and other spectral radiations"

"3 (a) The provisions of this article shall be deemed to prohibit the practice of radiology by any person other than a person licensed under the provisions of this article, or article forty-nine or fifty-three of this chapter, subject, however, to the conditions and limitations of his license"

Thus far the bill is satisfactory, but clause 3-b, as you will see, voids completely all of the preceding provisions

"3 (b) The practice of roentgenology upon human beings for the purpose of the making of an image or images of any part of the human body either by fluoroscopic demonstration or by registration on film, paper or other permanent means by the use of x-rays, and the rendering of a report on the matters shown by such image or images to a person licensed under the provisions of this article or articles forty-nine or fifty-three of this chapter or the ownership, maintenance or operation of a laboratory where roentgenology is or may be so practiced, shall not be deemed to constitute the practice of radiology"

Senate Int 187—Esquirol, Assembly Int. 183—Todd, provides for license of registered nurses and nursing aides by board of not less than seven members appointed by the Regents, and makes general rules and regulations Referred to the Education Committees

Comment Includes a comprehensive definition of the practice of nursing and requires that every nurse be licensed by the State in one or the other of two classes, "registered professional nurse" or "nursing aide." The qualifications of the registered professional nurse are those of the registered nurse of today, the qualifications of the nursing aide are to be defined by the Regents Ample waiver provision is made for licensing all unlicensed nurses practicing in the State today, into one or the other of the two groups Adequate provisions for enforcing the law are included and violations are listed and classed as misdemeanors

Senate Int. 202—Stagg, Assembly Int 287—Shaw, empowers local health boards and officers to provide surgical, medical treatment or hospital care for persons infected by or exposed to infantile paralysis who can not otherwise be provided for, one half of cost to be assessed against county and other half against State, and appropriates $200,000 Referred to the Health Committees

Comment It would seem that the State has already adequate facilities for meeting the provisions of this bill

Senate Int 243—Livingston, Assembly Int. 332—Wagner, relates to the practice of nursing, provides for licensing to practice as registered nurse, for appointment of advisory council, nothing in article to prevent a person from engaging in nursing if he or she does not assume title of registered nurse Referred to the Education Committees

Comment This bill is a very poor attempt at a solution of the nurse problem today It would extend the right to the title "R N" beyond those who are now entitled to receive it, to (a) those licensed as registered nurses in any state or any foreign country prior to the effective date of this act, (b) those registered in the future by any state or foreign country recognized by the Department as maintaining standards at least the equivalent of those required by this State, (c) those now licensed to practice in this State as trained nurses, and further provides that graduates of schools giving training courses of not less than two years may take a practical examination for registration Provision is made for the licensure of only one group of nurses, namely, the registered nurse, and while the waiver would admit to examination many who can not qualify under the present law, the period of this provision is limited There is nothing that will prevent in the future persons practicing nursing, regardless of their training or qualifications, provided they do not falsely claim to be registered or use the title "R.N" Violation of this provision shall be deemed a misdemeanor

Assembly Int 157—Hawkins, defines radiology and prohibits its practice except by certain persons and empowers municipalities to grant permits to physicians, dentists, podiatrists, and osteopaths to conduct places for practicing the same Referred to the Education Committee

Comment The radiology bill that we endorsed and approved last year In this bill the term "radiology" is adequately defined and the provisions for its practice and the conduct of laboratories are also well defined

Assembly Int. 236—Schwartz, provides that where seller labels canned, packaged or bottled food products for human consumption, there is an implied warranty to ulti-

Medical News

Broome County

DR. R J McMAHON addressed the Broome County Medical Society on "Cardiovascular Emergencies" on Jan 11, at the Monday Afternoon Club House in Binghamton The discussion was led by Drs R L Hamilton and Carl S Benson

Cattaraugus County

DR MARY JEPSON, who died recently in Miami Beach, Fla, had practiced medicine in Olean more than forty years

Chenango County

NEW BERLIN, LEFT WITHOUT a resident physician by the removal of Dr Cartwright appointed a committee to invite another doctor, and has secured Dr Michael A Cavuoti, who was graduated from the Long Island College of Medicine in 1933

Delaware County

DR WALTER E EELLS of Walton succeeds Dr Doreen R Corke of Hobart as president of the Delaware County Medical society Elections were conducted at Delhi on Dec 21

Other officers for 1938 include Dr W H F Newman, of Stamford, vice president, and Dr Orin Q Flint, Jr, Delhi, secretary-treasurer Dr Flint was re-elected

Principal speaker at the meeting and dinner was W T Burke of Poughkeepsie, who described the group hospitalization plan

DR WILLIAM B MORROW, seventy-nine, dean of Walton physicians and a civic leader in Walton and Delaware County for more than a half century, died December 18 a few minutes after he suffered a stroke at his home Dr Morrow had practiced medicine fifty-seven years of which more than fifty had been in Walton

Erie County

THE THINNING NUMBER OF PHYSICIANS' offices in Franklin street, Buffalo, south of Allen, at one time a medical center, was further reduced in January when Dr James B Cross removed his offices to 333 Linwood Avenue at Utica Dr Cross had occupied his recent offices in the Crosby building for twenty-one years The movement northward of physicians in that neighborhood began about 1922 when the late Dr DeLancey Rochester removed his office to 131 Linwood Avenue and a year later Dr Edward A Sharp removed to 81 Linwood Avenue It was again accentuated in 1926, '27 and '28 with the removal in a northerly direction of the offices of Dr Richard E DeNiord, Dr Ray H Johnson, Dr Irving W Potter, Dr Julius Ullman and Dr Allen A Jones Meanwhile death intervened and claimed the lives of Dr Henry R Hopkins, Dr James B Croff, Dr Francis W McGuire, Dr George W York, Dr Fred D Lewis and Dr Charles G Stockton, for many years residents in that section of Franklin Street The oldest surviving physician in the neighborhood is Dr Herbert Beals, hale and hearty in his eighty-third year Dr Beals was graduated in medicine in 1878

Franklin County

DR LAWRASON BROWN, tuberculosis specialist, died at his home at Saranac Lake, on Dec. 26, after a long illness of heart disease Dr Brown was sixty-six.

Dr Brown was a pioneer in work on intestinal tuberculosis and was among the first to suggest the use of roentgenologic evidence of classification of pulmonary tuberculosis as it is used today He founded "The Outdoor Life," which was first published by the Trudeau Sanatorium His book, "Rules for Recovery From Tuberculosis," written with H L Sampson, is widely used He also was the author of "Intestinal Tuberculosis," and "The Lung and Tuberculosis," the latter in collaboration with Fred H Heise

Dr Brown had long been an associate editor of "The American Review of Tuberculosis" and was one of the founders of the Saranac Lake Society for the control of tuberculosis He also founded the first chapter of the Osler Society

Greene County

Social Hygiene Day

J Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

The first anniversary of Social Hygiene Day (February 2) finds undiminished the popular hue and cry after syphilis Our profession is loaded with the responsibility of directing all this popular enthusiasm into useful channels

Two bills aimed at the prevention of congenital syphilis are before the Legislature One requires medical examination for syphilis before marriage, the other requires a serological test either during pregnancy or at the time of delivery Arguments pro and con will no doubt be advanced with a good deal of heat and the public interest that will result should create an opportunity for public education One thing is certain about both bills if they become law, their success will depend upon the support they receive from the public If the discovery of contagious syphilis is regarded merely as a tiresome barrier to matrimony, either the barrier or the matrimony will be circumvented and infection will not be controlled But if the discovery is felt to be as fortunate as the condition is regrettable and it leads to eager cooperation with the physician something important will have been achieved. Similarly a doctor may be required to test the blood of pregnant women but women can hardly be compelled to report their pregnancy in due season The fact that a test is routinely required should simplify the task of the obstetrician some of whose patients resent a serological test and it will undoubtedly bring to the attention of many women the importance of this precaution But it will not greatly influence the incidence of congenital syphilis unless there is widespread public sympathy with the intention of the law and an intelligent desire to take advantage of it

Of course there will be a certain number of conscientious objectors Even the innocent attempts of the Division of Syphilis Control to tell the public about syphilis in a form letter has aroused resentment here and there. Some recipients who had but recently been identified as syphilitic, not knowing that the same letter was falling upon saint and sinner alike, assumed that their confidence had been betrayed Others, less personal in their protest, object to departmental propaganda that conflicts with their religious faith Thus

> "Dear Doctor Brumfield
>
> I am also advertising a book entitled "Science and Health" by Mary Baker Eddy It is ignorance today not to know what it is Your propaganda sent me is an advertisement of the devil
>
> Yours sincerely,"

The campaign against syphilis is one that requires an unusual measure of goodwill and understanding between the branches of our profession engaged respectively in cure and in prevention For in this case treatment and prevention very conspicuously overlap The state, interested in the protection of its citizens from the contagious case, is prepared to subsidize treatment to any extent necessary Some private physicians, however, so much dislike the principle of subsidy that they would almost prefer to take the burden of cost upon themselves I found recently among the reports of district state health officers the following short story

> The reason for delinquency in this case was partly due to the inability of the patient to pay and the reluctance of the health officer to request payment from the local board of health.

All of us who are or have been in private practice will understand the doctor's hesitancy Yet I believe that we have no alternative in the face of a public menace but to accept public aid, unless we are in such a fortunate position that we can do the job equally well at our own expense

Medical Consultant Appointed

The Division of Syphilis Control, New York State Department of Health, announces the appointment of Dr James H Lade as medical consultant Dr Lade attended school at Fayetteville, New York, and went from there to the University of Syracuse, graduating in medicine in 1934 He served internships in the Syracuse General Hospital and in Fordham Hospital, New York City Dr Lade was granted a fellowship at Johns Hopkins Hospital Here he served for one year as assistant dispensary physician in the syphilis department under Drs J E Moore and T B Turner

declared in his annual report to Dr Nicholas Murray Butler, president of Columbia

Serving one of the largest university communities in the nation, the medical office not only ministers to the ill, but fosters a program of health supervision embracing examination and advice for students in the university and employes of the Department of Buildings and Grounds, the dormitories and the campus restaurants, Dr McCastline pointed out.

In 1912, when the medical service was organized, 2,967 persons were treated with limited facilities by a staff of two Since then the staff has grown to twenty-nine, including two full-time and nine part-time physicians, who are assisted by a group of thirty-five others in the annual medical examination of freshmen in Columbia College Consultations and treatments totaled 57,064 in the last year, which has been notable for a decrease in respiratory diseases, no epidemics and few contagious diseases

LECTURES AT THE NEW YORK ACADEMY OF MEDICINE

FEB 4—Philip D Wilson, Surgeon in Chief, Hospital for Ruptured and Crippled, "Orthopedic Surgery for the Arthritic," 4 30 P M

FEB 10—Dana W Atchley, M D, on "Diabetic Ketosis," 4 P M

FEB 11—Foster Kennedy, Director of Neurological Department, Bellevue Hospital "Nervous and Mental Disease in General Practice," 4 30 P M

FEB 17—Beverly Chew Smith, M D, "Gangrene, Infection, and Management of the Surgical Diabetic," 4 P M

FEB 18—William Thalhimer, Director, Manhattan Convalescent Serum Laboratory, "Convalescent Measles and Scarlet Fever Serums," 4 30 P M

DR. J HAMILTON CRAWFORD will speak on Congestive Heart Failure at the Long Island College Hospital on Feb 8 at 4 30 P M, and Dr William Goldring will speak on Renal Complications in Heart Diseases at Carnegie Lecture Hall, New York University Medical College, on Feb 15 at 4 30 P M

Niagara County

DR. WILLIS P WEAVER, eighty-four, one of Lockport's oldest physicians, died on Dec. 26 in Deaconess hospital, Buffalo Dr Weaver had been a practicing physician for fifty-five years

Ontario County

THE FIRST QUARTERLY MEETING for 1938 of the Ontario County Medical Society was held January 11, at Clifton Springs Sanitarium. Dr David B Jewett spoke on Serum Treatment of Pneumonia

Officers for 1938 are

President	Frederick C McClellan	Canandaigua
Vice-President	Alfred W Armstrong	Canandaigua
Secretary Treasurer	Daniel A Eiseline,	Shortsville

Board of Censors
Joseph S Morabito Malcolm R. Blakeslee
Albert G Odell

Delegate to State Society
H J Knickerbocker

Editor of Bulletin
Walter S Thomas

DR. BARTON T MCDOWELL, of Bristol, who died on Dec 27, was a former president of the Ontario County Medical Society He was sixty-nine

Oswego County

These officers were elected on December 15 by the Oswego County Medical Society

President	K Wood Jarvis, Oswego
Vice-President	John Mason Pulaski
Secretary	John J Brennan, Oswego
Treasurer	Joseph B Ringland Oswego

Chairmen of Committees

Economics	A G Dunbar Pulaski
Public Health and Medical Education	G A. Marsden, Oswego
Legislative	O J Mowry Minetto
Public Relations	Wm Fivaz Fulton

Censor (Three years)
Leroy Hollis

Delegate to State Society
O J Mowry

Alternate Delegate
K. Wood Jarvis

Otsego County

THE FOLLOWING ARE THE OFFICERS of the Otsego County Medical Society for 1938

President	L C Warren Franklin
Vice-President	J H. Powers, Cooperstown
Treasurer	F E. Bolt, Worcester
Secretary	F J Atwell, Cooperstown
Censor	E C Winsor

Delegate to State Society

Kings County

DR CLIFTON BOGARDUS, retiring president of the Ridgeboro Medical Society, after serving during 1936-37, was tendered a testimonial dinner by the Society on January 4, at the Bay Ridge Hofbrau

Many prominent physicians of Bay Ridge and South Brooklyn, in addition to men prominent in the political and business life of Bay Ridge were present

At its regular monthly meeting the Ridgeboro Medical Society heard an interesting discussion on "Pneumonia in Infants and Children," by Dr C H Smith and Dr H Greenwald

The newly-elected officers for 1938 are as follows Dr William Ostrow, president, Dr J Masterson, Dr H Bellach, and Dr Samuel Lasky, vice-presidents, Dr M Fisher, corresponding secretary, Dr J Koota, secretary, and Dr R Princer, treasurer

Dr Bogardus, retiring president, is chairman of the Board of Censors

ON THE EVENING OF Washington's Birthday, Feb 22, at the Hotel Astor, New York City, at 7 P M, The Medical Society of the County of Kings and the Academy of Medicine of Brooklyn and the Doctors Club will give a testimonial dinner to Dr Charles H Goodrich, president, Medical Society of the State of New York The tickets will be five dollars per person Following the dinner there will be entertainment consisting of a program by stars of the radio, screen and stage, and dancing to the music of a famous radio band This generous contribution is being made by The Mennen Company, Newark, N J All of the proceeds will go towards the fund to erect the proposed new building of the Medical Society of the County of Kings and the Academy of Medicine of Brooklyn

Madison County

THE MADISON COUNTY MEDICAL SOCIETY on Dec 16 elected these officers

President Richard B Cuthbert, Jr Canastota
Vice President Ernest Freshman Oneida
Secretary Lee S Preston Oneida

Board of Censors

Otto Pfaff Eugene H Carpenter
Orthello S Langworthy

The society was in session during the afternoon and evening and papers were given by Drs W Groat, Leo E. Gibson Edward C Hughes and W D Ayer, all of Syracuse. It was voted to form a speakers' bureau and make available to clubs and organizations members who can talk on the work of the medical profession in safeguarding public health

Monroe County

AT THE ANNUAL MEETING of the Medical Society of the County of Monroe, held December 21, the following officers were elected for the year 1938

President Leo F Simpson, Rochester
Vice President C V Costello, Rochester
Treasurer J J Rooney, Rochester
Secretary W A. MacVay, Rochester

Board of Censors

Warren Wooden Sol Davidson
B J Slater J J Finigan
J P Henry E G Whipple

Delegate to State Society

Warren Wooden J J Rooney
W A MacVay

Alternate Delegates

W H Veeder T T Huntington
Willis E. Bowen

Members of Milk Commission

J Merrell Parker A H Waffle

—Reported by William A MacVay, M.D., Secretary

THE MONROE COUNTY MEDICAL SOCIETY is polling its entire membership for volunteers to carry out a plan of District Attorney Daniel J O'Mara to examine all alleged ly intoxicated drivers immediately after their arrest

This poll will determine who will serve on a panel which will provide physicians in every precinct and town These doctors will be on call by police and deputy sheriffs

A committee under the direction of Dr G Kirby Collier is drawing up a proposed method of diagnosis which will be submitted to a meeting of the panel

In an attempt to determine how many cancer cases exist in Rochester, a questionnaire has been sent to every physician to list the cases he is treating

AN ESTATE EXPECTED TO approximate $500,000 was left by Dr C Sahler Hornbeck, thirty-nine, socially prominent Syracuse physician, who was killed Nov 7 when his automobile left Allen's Creek road and struck a tree, according to probate of his will in Surrogate's Court

New York County

MORE THAN 750,000 CONFERENCES and treatments have been provided for students, faculty members and employes by the Columbia University Medical Office since it was established twenty-five years ago, Dr William H McCastline, director of the office,

declared in his annual report to Dr Nicholas Murray Butler, president of Columbia

Serving one of the largest university communities in the nation, the medical office not only ministers to the ill, but fosters a program of health supervision embracing examination and advice for students in the university and employes of the Department of Buildings and Grounds, the dormitories and the campus restaurants, Dr McCastline pointed out.

Westchester County

DR RAPHAEL KURZROK addressed the Medical Society of the County of Westchester on Jan. 18 on "Endocrine Aspects of the Menopause," at New York Hospital, Westchester Division.

OBJECTION FROM A POLICY standpoint is expressed by the New Rochelle Medical Society to the Board of Education's plan to have its lunchroom workers examined by the school physician

The Society's protest was heard by the Board in a letter read at its monthly meeting on Jan 4 The doctors said they felt the examinations should be handled by the foodhandlers' own private physicians The Society contended the Board's proposition would be precedent-forming in the City

Mrs Charles P Oliver, chairman of the Special Cafeteria Committee, said school doctors perform the service in other County communities The Board decided to refer the matter to Superintendent Herold C Hunt for further consideration

A REGULAR MEETING OF THE New Rochelle Medical Society was held at New Rochelle Hospital, December 13 Dr Henry B Wightman, President of the Society, was in the chair and the guest speaker was Mr Elmon L Vernier, Director of Health and Physical Education of New Rochelle Schools, whose topic was "The Relationship of the Physician to the School Physical Education Program" Dr Charles Ogilvy, who has been voluntarily assisting the schools in conducting corrective physical education, also spoke on the prevention of deformities in the growing child

THE YONKERS ACADEMY OF MEDICINE held a stated meeting on December 15 at the Hudson River Country Club and received a timely paper on the "Management of the Pneumonias" by Dr Jesse Godfrey Bullowa Professor of Clinical Medicine at Cornell University and Director of the Nathan Littauer Foundation for the Study and Control of Pneumonia at Harlem Hospital, New York City Dr Bullowa's paper evoked a very interesting discussion and the Academy also held a lively business session, followed by the usual collation shortly after midnight

THE TOWNSFOLK OF YORKTOWN HEIGHTS, a quiet old town lying placidly among the hills of northern Westchester, are definitely charmed by the news that science, in the form of experts from the Rockefeller Foundation will soon be hovering over them, scraping germs from their throats, testing the blood and digging into family histories, in search of a vaccine for influenza, reports the New York *Evening Journal*

No such momentous event has occurred since, during the boom, a real estate development bought a lot of acres for about $80 an acre, divided each one into twenty parts and sold each part for $500

Now, they hear, the scientists are to bring up a lot of ferrets The ferrets will be infected with the virus taken from the noses and throats of Yorktowners

The ferrets, presto, will get influenza themselves And some ferrets will be injected with the blood of Yorktowners who had influenza, then re-infected, to find out whether the blood makes them immune

It is fascinating Except for a gas station man who thought the scientists ought to go to work on mumps instead—no less than 70 children having them at the present time—they were all strong for the idea

Said Enoch Lees, president of the Board of Education

'The people here are definitely receptive to the study, indeed, very glad to cooperate Yorktown was chosen, I am told, because it is a perfectly normal American community"

Yorktown has just enough isolation to suit the research workers, said Dr Matthias Nicoll, Westchester County health commissioner

There has never been a long-range study of influenza, which is what this study will be, Dr Nicoll said

"We don't know a great deal about influenza," said Dr Nicoll "During the first severe epidemic there was little opportunity for careful study The influenza virus has been isolated, it has been used to infect ferrets But we are still a long way from a vaccine Perhaps this study will help to find it."

A Correction

In the article entitled "Traumatic Subdural Hematoma" by Sidney W Gross, M D and Thomas J O'Kane, M D, which appeared in the last issue of the JOURNAL, an entire line was omitted

On page 117, right hand column, the second line did not appear The last sentence in that paragraph should read "In these cases a well-defined membrane has already formed The contents of the hematoma in the early cases is of the consistence and appearance of currant jelly"

We regret the error and extend our apologies to the authors

however, escape is indicated, the following list of "shoulds" must be observed exit signs should be placed over all doors leading to the outside, red exit lights should burn continuously, exit doors should be equipped with anti-panic bolts, alternate means of egress should be provided, and elevators should be in running condition at all times A reasonable number of stretchers should be available for bed patients, at least a three-foot pathway between rows of beds should be clear, stairways, fire escapes and fire towers should be of adequate width and the turns should allow for the easy maneuvering of the loaded stretchers The use of open outside stairway fire escapes is definitely contraindicated for hospitals and is fraught with danger because of sleet, ice and snow Since it is impractical to litter patients downstairs, vertical means of evacuation should be replaced by horizontal exits which have the advantage of ease and speed of movement and the protection of patient from exposure and unfavorable emotional reaction

The effectiveness of all fire apparatus will depend on the degree to which the personnel has been trained. Rescuers must be mobilized with military precision and every man must discharge his duties efficiently when the emergency arises But this is possible only where the fire drill is made part of the regular function of the institution.

However, if fire proof roofing is used exclusively, if the principles of good housekeeping are rigidly adhered to, if the circuits are not overloaded, if attics and basements are sprinklered, if plant and equipment are frequently inspected, if fire apparatus is maintained in working condition, if horizontal exits are provided, and if the personnel is fire-disciplined—then will casualties and money losses be reduced to a minimum

Seamy Side of Soviet Hospitals

A NEW BOOK ON THE land of Stalin, by a writer who ought to know what he is talking about, gives us an illuminating glimpse of their far-famed medical system The book, reviewed in the *AMA Journal* is entitled "Assignment in Utopia," by Eugene Lyons, who was for some seven years the United Press representative in Russia. He was sent to Russia because he had been known in this country as a communist and because his appointment was acceptable to the Russian government. He was probably the first to interview Stalin As the seven years passed he gradually changed his point of view so that eventually he left Russia at the request of the government. In his book, based on seven years of life in Russia from 1930 to 1937, he reflects in four and one-half pages his personal observations of medicine in Russia He says

> We came, unluckily, to know a lot more about Soviet medical practice than most of our colleagues Like the "stable" currency and the wonderful educational methods, the socialized medicine under the official statistical surface was a snarl of contradictions, shortages and ineptness Doctors and dentists regarded their obligatory work for the state as an exaction and depended on private practice for their real income. The more famous medical specialists did not budge for less than fifty or a hundred rubles, often it required "pull" to get their services at any price The public health service was by all odds inferior to the free public and charitable health services available to the poor in cities like New York or Chicago

Mr Lyons describes the experience of his wife, who became ill and who was taken to Botkinsky Hospital This section concludes

> Billy improved rapidly, despite the special care, and was soon well enough to watch the conduct of that hospital by way of sociological diversion. If I had not been there day after day and seen some of the primitive and careless procedure myself, I should have thought the details she told me were the effects of delirium. Only a few of the women were trained nurses—the others were ignorant girls of the servant type. They stomped up and down corridors and banged doors and called for one another in loud voices Except under unusual circumstances, bed linens were changed once a week. The blankets were not washed but merely disinfected, so that they were crusted with the dirt and vomit of previous patients The precious rules prohibited the bringing of linens, blankets, or other accessories from outside. But by devious means I smuggled in everything Billy needed, and doctors, nurses, patients came to her ward to inspect and exclaim over the fleecy American blankets, the hospital buzzed with the news of a foreigner who changed her sheets, her nightgown, and even her pillow-cases, every day
>
> The doctors, Billy thought, were capable but overworked. I succeeded—again by outraging the blessed rules—in having our own physician, who was familiar with her case, treat her As

Hospital News

Hospitals Lead in Fatal Fires

AMERICA LEADS THE WORLD in fires, and our hospitals "lead all institutions in the number of fires and loss of life and property," we are informed by E Ray Gram, of the New York State Department of Social Welfare, writing in *Hospital Management* "We boast of our high standards of hospital services," he remarks, "we lavish medical science and nursing care on a patient to save him from the abyss, only to sacrifice him later on the altar of fire" The lesson is, of course, that "the prudent superintendent should evaluate his fire protection before too late"

For example, the building should be constructed of fire-resisting materials, bins and storage rooms be well ventilated, inflammable waste put in metal containers, rubber hose not used on gas connections, and electric circuits not overloaded Mattresses and paints should be "fire-retardant," roofing fireproof and lightning rods placed where needed The danger of fires from anesthetic apparatus is well-known and should be carefully guarded against The heating plant should be in a separate building, or in quarters shut off from the rest of the institution Fire doors should be installed, and old hot-air conduits, laundry-chutes, dumbwaiters and flues should have cut-offs to stop the passage of fire and smoke Further

Among a multitude of fire hazards are faulty electric wiring, unprotected electric motors, loose coupling on electric cable conduits, paint shop near to boiler room, paper and towels used as shades in contact with electric bulbs, cloths drying on steam pipes, rags in back of radiators, leaking oil barrels, alcohol drums and other inflammables, debris in elevator pit, combustibles under stairways, disorderly storerooms, basements and attics Rats gnawing through electric insulation and spontaneous combustion of cosmetic rags in dresser drawers have caused more than one fire Electric flat irons and open gas flames are more common offenders So called fire proof buildings tend to give the administrator an undue sense of safety But concrete has been spalled and steel supports have been bent into fantastic shapes by high temperatures developed in intense fires

Right and Wrong Extinguishers

Various fire-alarm systems are described, and then Mr Gram has a word to say about extinguishers

There are extinguishing agents particularly effective for each class of fire, and a wrong choice may do more harm than good. The familiar soda-acid extinguisher if played on burning oil would spread the fire, if directed at a blaze rising from electrical machinery might prove fatal to the amateur fire-eater In addition to being an excellent conductor of electrical current the soda-acid solution tends to corrode machinery Be sure to test this extinguisher just before recharging, otherwise if inverted for test and then replaced for use corrosion may "fix" the cork in the acid bottle or plug the nozzle, thus creating a potential retard. Keep foamite extinguishers on hand in the operating room, kitchen, boiler room and drug room or wherever there is risk of fire from oil. The tetrachloride extinguisher is preferred where machinery is concerned. If extinguishers are placed where low temperatures may prevail, select a solution with anti-freezing components such as calcium chloride, carbon tetrachloride, etc. An extinguisher of less than two and a half gallons capacity is advisable because it is lighter and easier for nurses to handle. Distribution of extinguishers should be made according to the floor plan and the peculiar conditions extant. Know which one to use and get acquainted with its range, coverage and method of use The National Fire Protection Association will gladly furnish instructions

The weight of expert opinion rests on automatic sprinklers as the most efficient fire-fighting apparatus Especially is their installation necessary in attics, basements, closets, storerooms, laboratories and stairways This system should be inspected annually and a supply of sprinkler heads should be kept on hand.

Water supply and water pressure found to be under requirements should be supplemented by a water tower and pressure pumps Water towers in rural communities should be heated in winter when the temperature drops below the freezing point. This is accomplished by jacketing the tower for passage of live steam or affixing an electric plate to the base. A clear path to outside hydrants should always be maintained. Fire equipment is not complete without a supply of smoke masks

To Escape the Flames

But suppose, despite everything, that fire breaks out Then—when to fight and when to flee belong to the niceties of decision If,

however, escape is indicated, the following list of "shoulds" must be observed exit signs should be placed over all doors leading to the outside, red exit lights should burn continuously, exit doors should be equipped with anti-panic bolts, alternate means of egress should be provided, and elevators should be in running condition at all times A reasonable number of stretchers should be available for bed patients, at least a three-foot pathway between rows of beds should be clear, stairways, fire escapes and fire towers should be of adequate width and the turns should allow for the easy maneuvering of the loaded stretchers The use of open outside stairway fire escapes is definitely contraindicated for hospitals and is fraught with danger because of sleet, ice and snow Since it is impractical to litter patients downstairs, vertical means of evacuation should be replaced by horizontal exits which have the advantage of ease and speed of movement and the protection of patient from exposure and unfavorable emotional reaction

The effectiveness of all fire apparatus will depend on the degree to which the personnel has been trained Rescuers must be mobilized with military precision and every man must discharge his duties efficiently when the emergency arises But this is possible only where the fire drill is made part of the regular function of the institution.

However, if fire proof roofing is used exclusively, if the principles of good housekeeping are rigidly adhered to, if the circuits are not overloaded, if attics and basements are sprinklered, if plant and equipment are frequently inspected, if fire apparatus is maintained in working condition, if horizontal exits are provided, and if the personnel is fire-disciplined — then will casualties and money losses be reduced to a minimum

Seamy Side of Soviet Hospitals

A NEW BOOK ON THE land of Stalin, by a writer who ought to know what he is talking about, gives us an illuminating glimpse of their far-famed medical system The book, reviewed in the *AMA Journal*, is entitled "Assignment in Utopia," by Eugene Lyons, who was for some seven years the United Press representative in Russia He was sent to Russia because he had been known in this country as a communist and because his appointment was acceptable to the Russian government. He was probably the first to interview Stalin As the seven years passed he gradually changed his point of view so that eventually he left Russia at the request of the government. In his book, based on seven years of life in Russia from 1930 to 1937, he reflects in four and one-half pages his personal observations of medicine in Russia He says

> We came, unluckily, to know a lot more about Soviet medical practice than most of our colleagues Like the "stable" currency and the wonderful educational methods, the socialized medicine under the official statistical surface was a snarl of contradictions, shortages and ineptness Doctors and dentists regarded their obligatory work for the state as an exaction and depended on private practice for their real income. The more famous medical specialists did not budge for less than fifty or a hundred rubles, often it required "pull" to get their services at any price. The public health service was by all odds inferior to the free public and charitable health services available to the poor in cities like New York or Chicago

Mr Lyons describes the experience of his wife, who became ill and who was taken to Botkinsky Hospital This section concludes

> Billy improved rapidly, despite the special care, and was soon well enough to watch the conduct of that hospital by way of sociological diversion. If I had not been there day after day and seen some of the primitive and careless procedure myself, I should have thought the details she told me were the effects of delirium. Only a few of the women were trained nurses— the others were ignorant girls of the servant type They stomped up and down corridors and banged doors and called for one another in loud voices Except under unusual circumstances, bed linens were changed once a week The blankets were not washed but merely disinfected, so that they were crusted with the dirt and vomit of previous patients The precious rules prohibited the bringing of linens, blankets, or other accessories from outside But by devious means I smuggled in everything Billy needed, and doctors, nurses, patients came to her ward to inspect and exclaim over the fleecy American blankets, the hospital buzzed with the news of a foreigner who changed her sheets, her nightgown, and even her pillow-cases, every day
>
> The doctors, Billy thought, were capable but overworked. I succeeded—again by outraging the blessed rules—in having our own physician, who was familiar with her case, treat her As

soon as she could be moved safely she returned home

Ever after, the glowing reports of socialized medicine in Russia in American books and magazines have been a source of amusement to us Always we have wished their authors only one punishment—a week or so as patients in the second-best hospital in Russia.

New York City's Army of Nurses

BESIDES THE NEW Central Nurses' Residence with 678 rooms on Welfare Island, New York City, another Nurses' Residence providing 669 rooms is nearing completion at Kings County Hospital in Brooklyn New modern fireproof Residences have been completed and occupied at Greenpoint (94 rooms) Kingston Avenue (147 rooms) and Queens General Hospital (136 rooms) Modern fireproof extensions have been added and occupied at Harlem (216 rooms), Riverside (37 rooms), Metropolitan (40 rooms) and Sea View Hospital (172 rooms)

This represents a total of 2189 rooms in which Resident Nurses will be housed under most satisfactory conditions

The new Central Nurses Residence on Welfare Island will permit of the evacuation of present unsuitable Nurses' quarters at City Hospital, Neurological Hospital, Cancer Institute, and the Home for Dependents

Modern Nurses' homes of fireproof construction, some, however, not adequate in size, are to be found at Bellevue, Coney Island, Fordham, Gouverneur, Lincoln, Morrisania, and Willard Parker Hospitals

The nursing service of those institutions that were in the Department of Hospitals in 1933 has been augmented, under the present administration, by 1738 trained nurses and 802 attendants, total 2540 In addition, 448 trained nurses and fifty-nine attendants have been obtained for new institutions or units opened during this period, or a grand total of nurses and attendants added by Dr S S Goldwater, Commissioner of Hospitals, of 3047

Six schools of nursing are conducted in the Department of Hospitals at Bellevue, Cumberland, Harlem, Kings County, and Metropolitan Hospitals respectively Bellevue Hospital has a school for men and a school for women and serves as a central School for the preclinical students of three other city schools Schools for affiliating students are conducted at Sea View, Willard Parker, and Fordham Hospitals A school for communicable disease nursing was opened at Kingston Avenue Hospital last October

The Department of Hospitals had admitted for training and experience in selected services students from more than fifty schools of nursing

To Open Hospital Doors to a Million More

PLANS FOR LOW-COST GROUP hospitalization for 1,000,000 persons now unable to pay for medical service are now being formed, Dr S S Goldwater, Commissioner of Hospitals, revealed at the Cosmopolitan Club, to a meeting of the New York City Visiting Committee of the State Charities Aid Association on Dec 17

Dr Goldwater explained that if present plans are carried into effect group hospitalization in wards could be provided for those who are now forced to seek free medical care. He said negotiations are now going on among the Department of Hospitals, representative groups of the medical profession and the hospitals to evolve a suitable organization He praised the cooperation and interest which medical leaders are showing in the negotiations

Dr Adolph G DeSanctis, president of the Medical Society of the County of New York, when asked about the proposal, confirmed that a committee of medical leaders is "investigating thoroughly" the group hospitalization project He said that both he and Dr Goldwater are serving on the committee, which includes representatives from all five county medical societies

"We are especially concerned about providing proper medical care for the large number of persons who are in the group just above the indigent class," Dr DeSanctis asserted "We have achieved nothing concrete as yet, but may do so by next month We are very hopeful that something will come of the proposal after thorough investigation"

Dr DeSanctis, at his induction as presi-

dent of the New York County Medical Society last January, proposed a plan to bring about a considerable lowering of the cost of medical care to New Yorkers in the "moderate income" group Dr DeSanctis, who is a director of the Department of Diseases of Children at the New York Post-Graduate Medical School of Columbia University, proposed the establishment of a medical service bureau to provide medical care according to a patient's ability to pay

Dr Goldwater told the 200 persons at the meeting that there is "an increased trend" toward government responsibility in providing adequate medical care for the people He asserted that "there is nothing in sight" to indicate that the drift toward community responsibility for the sick would be altered Dr Goldwater appealed for additional funds to allow his department to construct new hospitals and to rehabilitate others

Homer Folks, president of the New York City Visiting Committee and chairman of the meeting, said that the city under the present administration has "a unique opportunity to obtain intelligent and sufficient hospital care" He paid tribute to the interest shown by Dr Goldwater and Mayor La Guardia in improving city hospitals

Newsy Notes

GREATER EFFICIENCY AND ECONOMY in the management of the hospitals at the Medical Center during 1938, under control of a single governing board which became effective on Jan 1 is forecast by officers of Columbia University and Presbyterian Hospital, which jointly operate most of the facilities at the center

Five vacancies on the board of thirty-six managers of the Presbyterian Hospital were filled by appointees from the Neurological Institute board, it was explained. Although the Neurological Institute, which is part of Columbia University, and the Presbyterian Hospital will continue separate existences, both hospitals will be operated under the one board.

"The new plan will greatly strengthen the Columbia-Presbyterian Medical Center by centralizing control," John McCormack, superintendent of Presbyterian Hospital, said

"With the exception of Columbia's School of Medicine, the teaching facilities of which will remain exclusively under the control of Columbia, and the New York State Psychiatric Institute, a State project, the entire Medical Center group will now be under one organizational control"

Dr Walter W Palmer, Professor of Medicine at Columbia University, will assume the post of medical director of the Neurological Institute. He will continue also as head of the medical service at Presbyterian Hospital

THE NEED FOR THE ESTABLISHMENT of a community hospital was stressed at a meeting of the Taxpayers' Civic Association of Maspeth held in the clubrooms at New National Hall, in December

Walter Scahacz, president, pointed out that Maspeth residents are forced to seek hospitalization at St John's Hospital, Long Island City, Queens General Hospital on Grand Central Parkway or in Wyckoff Heights Hospital, Ridgewood.

"We deserve adequate hospitalization for our families and children," Mr Scahacz remarked in urging that immediate steps be taken to secure this objective.

•

THE COUNTY WAS WELL REPRESENTED by its physicians at a dinner given in December at the Memorial Hospital of Greene County, by the hospital's board of managers and Miss Alice Le Gallais, superintendent, for the medical staff George W Irwin, board president, presided and gave a brief welcoming address in which he also expressed his appreciation for the cooperation extended by the physicians in establishing the hospital

It was noted that the hospital had received provisional recognition from the American College of Surgeons and was to receive full recognition when a few requirements were met and these were discussed by the group at the meeting

AN OLD MAN, rabbi of the Dean Street Temple, Brooklyn, returned to St. John's Hospital on Jan 2 with a testimonial penned

soon as she could be moved safely she returned home

Ever after, the glowing reports of socialized medicine in Russia in American books and magazines have been a source of amusement to us Always we have wished their authors only one punishment—a week or so as patients in the second-best hospital in Russia.

"We are especially concerned about providing proper medical care for the large number of persons who are in the group just above the indigent class," Dr DeSanctis asserted "We have achieved nothing concrete as yet, but may do so by next month We are very hopeful that something will come of the proposal after thorough investigation"

Dr DeSanctis, at his induction as presi-

the Medical Society of Westchester County has gone on record with a resolution urging the Board of Supervisors to provide funds to increase the number of beds and nursing staff, purchase additional equipment and expand the outpatient departments

At the present time there are 252 beds in use for tuberculosis adult patients at Grasslands, although the building was originally planned for 210 It is estimated to take care of load of the entire county, including the city of Yonkers, it would be necessary to provide 300 more beds

To meet part of this load, the Department of Public Welfare has requested funds for the renovation of the old tuberculosis wing of the main hospital building, which would permit the addition of eighty beds

• • •

GROUND WAS BROKEN on Christmas Day at Patchogue, L I, for the proposed $175,000 John Van Brunt Roe Municipal Hospital to be built with funds bequeathed by the late Nettie C Roe, who died in 1929 The hospital is to be named for her late father

THE RECENTLY COMPLETED FIVE-STORY wing to Holy Family Hospital, which cost $300,000, will be officially dedicated early in February by Bishop Thomas E. Malloy

The twenty-five year-old hospital at Dean and Hoyt Sts, Brooklyn, will be supplemented by a new building, which will have beds for 110 patients

More than $200,000 of modern equipment will be distributed in the wing's two new operating rooms Electrocardiographic appliances will be installed.

The opening of a new wing for the hospital is a victory for various civic and religious organizations, which contributed to the institution s support when it was threatened financially a few years ago

•

THE NORWEGIAN HOSPITAL in Brooklyn celebrated the Christmas season with the opening of its enlarged and thoroughly modern pediatric department in the north wing of its building

The new department consists of a large general ward for children, a private ward, an examination room equipped with modern operating facilities for blood transfusions and child care, an electrically operated dietetic kitchen, where food for infants and children is prepared under the most exacting scientific conditions, and a modern milk laboratory

The general children's ward has room for twenty-six beds and is equipped with cubicles, the upper half of which are of glass, giving the effect of private rooms for each patient, yet making it possible for the children to see each other

The examination room is apart from both the general ward and the private ward. In addition to the pediatric department a pediatric clinic is available for the periodic examination of infants born in the maternity department. Here babies are carefully examined over a period of six months or a year

The enlarged department is under the supervision of Dr Charles M. Fisher, F.A C P, and Dr John Monfort, F.A.A.P They are assisted by Dr Herman Kretzchmer, Dr Anna R. Mustonen and Dr Thomas Re A specially trained pediatric nurse, Miss Elizabeth Berg, R.N, is in charge of the nurses in that department.

Funds for the enlarging and equipping of the department were largely contributed by supporters of the institution. Dr Andrew N Rygg is president of the hospital board.

At the Helm

THE FOLLOWING HOSPITAL OFFICIALS HAVE BEEN CHOSEN

Harry Weinberg, to be president of the Beth El Hospital in Brooklyn, fourth consecutive term.

Mrs Paul Beck, to be president of the Flushing Hospital Auxiliary Governing Board.

Dr H P Groesbeck, to be president of the board of managers of the Schenectady County Tuberculosis Sanatorium.

Dr Glenn R. Ford to be president of the staff of Endicott Ideal Hospital Dr Frank G Moore was reelected chief of the surgical staff and Dr Edward M Jones was renamed chief of the medical staff

W W Smith, reelected president of the Alice Hyde Hospital Association at Malone.

and illuminated in water-colors by him in token of his gratitude to the institution for saving his life when he was stricken with heart disease last Summer The hospital is maintained by the Church Charity Foundation of the Protestant Episcopal Diocese of Long Island

When Rabbi Elias Margulies arrived, his beard neatly trimmed and step firm, the Rev Charles Henry Webb, director, greeted him with evident surprise He accepted the scroll, which read

"I was saved by the skill of the physicians whom God gave power and the will my prayer to fulfill And the wonderful nurses of the hospital staff treated me fine, I therefore want to express my thanks—it was divine. God bless you for the fine work you do in helping those who are sick to become well and strong I thank you."

Improvements

PREPARATIONS TO EVACUATE THE Administration Building at Ellis Hospital, Schenectady, are under way as the hospital's Board of Managers are planning the razing of the structure and construction of the new wing on its site

The firm of James E Lowe and Sons, Schenectady, has been awarded the general contract for the addition

The new wing, to be forty feet wide, 260 feet deep and five stories high, will extend toward the junction of Rosa Road and Nott Street

The project was made possible through the pledges of over $850,000 made in the recent campaign

Enlargement of the pathological laboratory on the ground floor of Wing D and new quarters for the physiotherapy department on the ground floor of Wing E will be made possible by the additional space afforded

The new building, in addition to giving space to 100 beds, thus increasing the hospital's capacity to 375 beds, will house a modern x-ray department, a library and records department The ground floor of the new structure will be used as a kitchen and dining room It will contain also a diet kitchen, central serving room, dietitian's office, guest dining room and dining accommodations for internes, officers, faculty of nurses' school and hospital personnel There will also be a cafeteria

A waiting room, administration and business offices, medical wards and four private rooms will be on the first floor Near the private rooms will be the metabolism and electrocardiograph room

The second floor, devoted to a maternity department, will contain three delivery and three labor rooms, two nurseries and a solarium There will be a formula room and private and semi-private rooms for patients

A children's ward, with the x-ray, library and records departments, will be on the third floor The Schenectady County Medical Society will have a special tonsil ward on this floor

About twenty-five private rooms, a seven-bed ward and a three-bed ward, and a spacious solarium will be located on the fourth floor

The addition is expected to be ready for occupancy next Fall

. . .

THE HOSPITAL FOR JOINT DISEASES in New York City has filed plans for a four-story clinic adjoining its main building, which occupies the block front on the east side of Madison Avenue, between East 123d and 124th Streets The addition will cost $450,000 and will occupy a frontage of 99.2 feet on 123d Street and 57 8 feet on 124th Street, running through the block It will be erected from plans by Charles B Meyers, architect.

OAKLEIGH THORNE, Millbrook, one of the trustees of St. Francis' hospital, in Poughkeepsie, has presented the hospital with a new La Salle ambulance It will accommodate two patients and has a detachable swinging hammock for a third patient. It carries a chromium plated portable type stretcher carrier, mounted with balloon type tires The stretcher is equipped with a form fitting rubber mattress with foot rests as well as arm supports Modernistic mahogany cabinets decorate the interior, ample enough to supply any medical need while en route to the hospital

FEELING THAT PROVISION of immediate needs of the Tuberculosis and Psychiatric Divisions of Grasslands Hospital will be a future saving in human life and money,

In so ruling the Court said in its opinion with reference to the interpretation of the statute above referred to

Mr G (appellant's counsel) contended that the proper construction of the words 'infamous or disgraceful conduct in a professional respect" is infamous or disgraceful "in the ordinary sense of the epithets and in accordance with the common judgment of men." Mr M, on behalf of the College, contended that the test is not whether the acts complained of would be regarded as infamous or disgraceful conduct in the common judgment of men, but whether they would be so regarded by the accused's professional brethren of good repute. Who would be the best judges of what was infamous or disgraceful conduct in a professional respect? Obviously, the members of a man's own profession where certain recognized conventions or codes of honor prevail It appears to me that the natural construction of the language used is that the standard by which the accused is to be judged is not what is infamous or disgraceful conduct in the common judgment of men but that which is infamous or disgraceful conduct in the judgment of his professional brethren of good repute and competency

With reference to Dr H's failure to disclose the nature of his remedy, the Court said in part

Dr H gave no satisfactory reason for failing to disclose to his professional brethren or to the public, the formula of his serum. If he really believes he has discovered a serum which will cure cancer, why does he not confer on humanity the benefit of his discovery If his serum has real merit no one would receive greater honor or reap a richer reward than Dr H from such disclosure. His persistent refusal to make disclosure compels me to ask the question, is he really convinced that his serum will do all he claims for it, or is his opinion influenced, consciously or unconsciously, by the remuneration he receives for treating patients? The question, however, is not whether Dr H is honest in his claim, he may be perfectly honest. The question is not whether his serum may or may not ultimately prove all that he claims for it. The real question is, having regard to the widespread and malignant character of the disease and the anxiety of people to secure a remedy, has a physician who claims to have discovered a serum which will cure cancer, but which has not been submitted to any scientific test nor disclosed to any scientist or any other medical man, and which has not in fact been proven to be a cure for cancer, and who advertises by circulars to the profession that he has a cure for cancer, and solicits patients through these circulars, done something in the pursuit of his profession "which would reasonably be regarded as disgraceful or dishonorable by his professional brethren of good repute and competency?" Such conduct may, I think, be "reasonably regarded as disgraceful and dishonorable by his professional brethren of good repute and competency"

It is of the greatest importance that if there is real merit in Dr H's serum the public should have the benefit of it. If there is no real merit, the public should know it. During the course of argument the Court suggested as a possible solution that Dr H should disclose to some independent scientific body the formula for his serum, and that under the supervision of this body, with Dr H's cooperation, patients should be treated, so that its effects might be carefully tested, and that in the meantime Dr H's name should be restored to the register Counsel for the College intimated that the College would accept this solution but counsel for Dr H stated it was not possible to agree to it as Dr H's position was that the time was not opportune to disclose his formula I hope Dr H will yet change his mind and act on the suggestion of the Court, and if he does so, that the College will reinstate him

POSTGRADUATE STUDY IN SYPHILIS

A program of postgraduate study in syphilis has been arranged at the New York University College of Medicine to extend from February 15 to June 15 The course is made possible by a grant from the United States Public Health Service through the State Department of Health

The training is intended primarily for physicians already working in state and local departments of health but other physicians may be accepted The work will be done in the New York University College of Medicine, in the syphilis clinics and wards of Bellevue Hospital, and in the various laboratories and bureaus of the New York City Department of Health devoted to venereal disease study

Physicians at present engaged in health department work may apply either directly to the office of the dean at the College of Medicine, 477 First Avenue, New York City, or through their state health departments Others should apply directly to the College

ALUMNI DAY MEDICAL PROGRAM

The New York University College of Medicine announces through James W Smith M D, Secretary of the Committees on Science, Education, and Entertainment that Alumni Day will be celebrated February 22 Many prominent medical men are scheduled to speak The complete program will be published in the next issue of this JOURNAL

Medicolegal

LORENZ J BROSNAN, ESQ
Counsel, Medical Society of the State of New York

Professional Misconduct — Falsely Advertising Cure for Cancer

An interesting case involving discipline of a licensed practitioner of medicine in connection with his activities with respect to an alleged specific cure for cancer recently came before the appellate court in a nearby jurisdiction *

Charges were brought against a certain Dr H that he had been guilty of infamous or disgraceful conduct, first in that he had claimed to have discovered a specific cure for cancer but that his claim was unsubstantiated, and, second, in that he had represented to persons suffering from cancer that if they would submit to his treatment they could and would be cured when in fact they were not so cured The relevant sections of the Act relating to medical practice under which the proceedings were instituted against Dr H contained the following provision

> 30 (1) Where any registered medical practitioner has either before or after he is registered been—guilty of any infamous or disgraceful conduct in a profession respect, such practitioner shall be liable to have his name erased from the register

The charges against the accused were duly investigated by the Discipline Committee of the College of Physicians and Surgeons Upon those hearings it appeared that Dr H claimed that he had been working for years upon the subject of cancer seeking to discover a remedy, and that in 1931, he discovered what he described as a "specific" for it, which he had been using since that time The next year he had circularized the medical profession concerning his claimed discovery and in his circular he had stated "The germ theory plus irritation is the only rational explanation of the cause of cancer and this must be met by a specific This I have discovered and it is given intravenously The result of this treatment is seen in my patients Shall be pleased to have you correspond and make inquiries as regards any case you may have" Other circulars were sent out which included particulars of cases treated with illustrations of claimed results

When he appeared before the examining body Dr H declined to disclose what his specific was or how it was prepared He was vague in his responses as to the amount of the solution administered, and as to methods of administering doses He was unable to furnish definite information as to the number of cases treated each year, but it appeared that he treated a considerable number Four patients treated gave evidence upon the hearing, but all had been operated and had received x-ray or radium treatment or both before Dr H had begun his treatments

Although these patients credited their improvement to Dr H, the evidence was not clear as to whether the results were due to his treatment or were in spite of his treatment There was no proof that any of these patients were definitely cured.

Dr H was given an opportunity to call as witnesses patients who had not had prior x-ray or radium treatment whom he had claimed to have cured, but he failed to produce such proof

Dr H explained his refusal to disclose the formula of his remedy by claiming that he was afraid he would lose the benefit of it and thus lose the result of his life's work.

There was proof adduced that the accused had made charges to his patients of from $15 to $25 per treatment

After hearing the evidence the Discipline Committee reported that it was determined that Dr H, a registered medical practitioner claimed to have discovered a specific and a cure for cancer, that his said claims were not supported, but that in spite of that fact he had for over five years treated cancer patients with his remedy and charged fees therefor The report, however, included a finding that the evidence was insufficient to support the charge that he had warranted cures Upon these findings the Medical Council of the College of Physicians and Surgeons by resolution ordered that the name of Dr H be erased from the register of physicians and surgeons, thereby revoking his license to practice

Dr H appealed from the action taken but the appellate court sustained the disciplinary action which had been taken, and dismissed the appeal

* Matter of H——(1937), 3 D L R. 687

Hospitals Opened to Invasion

"Every hospital in the state" would find itself invaded by this amendment, declares President Black. To quote

Let us consider what this amendment would do It specifies, "tax-supported and partially tax-supported hospitals" Every hospital in the state comes under the legal definition of "*partially tax-supported*" Every time a private hospital accepts even a single patient whose hospitalization is paid for by city, county, state or by The Workmen's Compensation Insurance Fund, that hospital then is partially tax-supported for that year, and therefore it is evident that should this proposed amendment become a part of our constitution, it would open every hospital in the state to chiropractors, optometrists, chiropodists, midwives, naturopaths, and WHAT HAVE YOU!

"Scintillating Pseudo-Science"

A sample plea of the backers of this measure is interesting, or, as *Colorado Medicine* calls it, "a sample of their scintillating pseudo-science." Here it is

Did you know that the majority of ordinary mental cases can be cured by chiropractic—that 40 to 60 per cent of the 'hopeless' cases in psychopathic hospitals throughout the country are being completely cured, despite the fact that most of them had been declared incurable—that your loved ones confined in the insane asylum in Pueblo and tax supported homes for child mental defectives are denied the benefits of such treatment—that chiropractic and other drugless treatment could cure a very large percentage of them, restore them to their loved ones and greatly reduce the expense of such institutions to the tax payers? The Health Freedom Amendment makes it incumbent upon the authorities to supply all recognized drugless methods, as well as medical treatment, to these poor helpless victims

"Chaos Worse than Babel"

Other states are taking alarm and see the Colorado campaign as merely the opener of a drive that may become national in scope. Thus the *Illinois Medical Journal* prints a leading editorial declaring that this "is the problem of every state in the Union, for what can happen in Colorado can and will happen anywhere" It observes

Demonetization of silver was the first contemporary disaster to overtake the grave western state of Colorado, and to break down its fences for progress Trouble after trouble has since overtaken the commonwealth—one of the younger states in the Union since its admission dates back only as far as 1876 Industrial arguments, political confusions, dust storms and other ebullitions of economics or of nature are followed now by what seems to be the complete communization of Colorado

New legislation would appear to be about to sweep away the bulk of the safe and sane statutes with medicine being the wooden horse to drag the enemy, concealed and dangerous, within the gates, and the cults booting the horse from behind. Word from Colorado announces that petitions are now in circulation throughout Colorado's extensive area to initiate an amendment to the Constitution of Colorado, which if adopted will effectively repeal *the Medical Practice Act, at least temporarily cancel every professional license in Colorado, repeal the bulk of the public health laws, destroy the Basic Science Law and open every hospital and all insurance and compensation practice to every conceivable type of healing cult* What price the confusion of tongues?

Chaos worse than Babel will result in the professions of medicine, law, dentistry, nursing, engineering, accounting and all other professions ad infinitum if this proposed amendment goes through It is expected from the number of signatures already obtained to the petitions in circulation that the constitutional amendment will appear on the ballot for the 1938 general election.

The amount of money that all the charlatanistic cults are pouring into this effort to achieve this sad end is amost beyond the imagination. Public statements of the backers of the endeavor evidence plainly that the chief objects in view are the destruction of those statutes designed to protect the public by licensing professions under state regulation, with the attack of course PRIMARILY AGAINST MEDICINE, which it must be confessed looks much like a gentle touch from Washington, D C. Staid Colorado citizens—and some few such remain—state candidly that this is the most vicious attack ever aimed in Colorado at medicine and public health

This is the rankest of medical anarchy, and it is not Colorado's problem alone. It is the problem of every state in the Union, for what can happen in Colorado can and will happen anywhere.

Apathy in the face of this peril will be fatal, declares President Black of the Colorado Hospital Association, and in a neat paraphrase he gave a piece of advice that fits all the struggles that now beset the profession

Ill fares the land to hastening ills a prey,
Where overconfidence accumulates and men delay

Across the Desk

"Freedom! What Crimes are Committed in thy Name!"

"HEALTH FREEDOM" is the engaging title attached to a proposed amendment to the Constitution of Colorado which the cultists of the state are working tooth and nail to get adopted at this year's election Its backers must have 37,000 signatures to "initiate" the measure and assure its appearance on the ballot, and *Colorado Medicine* said in November that they were reputed to have two-thirds of that number then Colorado medical and hospital authorities expect that the required signatures will be obtained by the corps of workers paid to get them, and the amendment will face the voters on the ballot in the fall

How the Colorado physicians feel about it may be gathered from this biting comment in the organ of that State Medical Society

So they call it the "Health Freedom Amendment!"

Yes, it has to do with Health, all right—it would endanger the health of every citizen in the state, particularly the poor and those in any type of state institution

Yes, it has to do with Freedom, too—freedom from prosecution, for every quack, crook and charlatan who calls himself some kind of doctor and imposes upon the credulous, for the amendment would repeal all the protective health and healing laws built up by previous generations—freedom, yes, the same kind that exists in pure anarchy

Merely the Opening Battle

Nor is Colorado alone in danger President Herbert A Black, M D, of the Colorado Hospital Association, says that the state has been selected for the opening battle "by interests national in extent." If they win there, then other states will be attacked, so that we have here a matter of acute national concern The proposed amendment reads

"Be it enacted by the people of the State of Colorado, The Constitution of the State of Colorado is hereby amended to include therein the following *Article*

"Section 1 No person shall be denied the exclusive right, to choose his own State licensed system of healing and doctor, for State required examinations, or for therapeutic services in connection with State compensation or other insurance benefits, nor to choose his own State licensed system of healing, and to have such service rendered to him while an inmate, patient, or charge, of tax-supported or partially tax-supported corrective, therapeutic, eleemosynary, or other public institutions in the State.

"Section 2 No profession recognized by the State shall be denied the exclusive right to examine, license and regulate the practice of its own members, through its own legally constituted board or authority

"Section 3 This amendment shall be self-executing, and the general assembly shall enact such regulatory measures as are necessary to carry out its purposes"

Would Kill Medical Practice Act

This amendment, for one thing, would nullify Colorado's Basic Science Law, less than a year old That is the opinion of an eminent legal firm engaged by the State Medical Society to study its possible effects They report

It is our opinion that, if this constitutional amendment be adopted, it will

(1) Definitely destroy the basic science law passed at the last session of the legislature.

(2) Repeal virtually the entire medical practice act so far as it relates to the qualifications, examinations, licensing, regulation, and control of those who desire to engage in the practice of medicine and surgery, midwifery, and chiropody

(3) Will destroy all state statutes providing for the examination, licensing and regulation of the practice of members of every profession recognized by the state.

(4) Will preclude all future action by this legislature in conflict with such amendment providing for the examination, licensing and regulation of the practice of every profession recognized by the state.

(5) In all cases in which mental or physical examinations are required by the state law or regulations of the board of health, make it possible for the person so to be examined, to demand that such examination be made by a doctor of any state licensed school of healing or therapy of his choosing

This will include not only lunacy inquisitions but also the treatment of lunatics after commitment, the treatment of all persons in any legal place of detention, where the law at present provides for their examination and treatment.

excellent piece of work by an authority in the field of nutrition, and highly recommends it to students in science courses and to the medical profession—not to the lay public.

PAUL C ESCHWEILER

Surgical Treatment. A Practical Treatise on the Therapy of Surgical Diseases By James Peter Warbasse, M D & Calvin M Smyth, Jr, M D Second edition in three volumes Octavo, illustrated Philadelphia, W B Saunders, 1937 Cloth, $35 00

The first edition of this work was brought to the attention of the profession in 1918 and contained at that time, 2,400 illustrations The second edition, which has been brought up to date and revised, is well illustrated Some of the illustrations are in color, which adds considerably to the descriptive anatomy on the various parts of the body under discussion The subject matter has been divided in somewhat similar manner As in the previous volumes, ideas and practices which have become antiquated since the first edition have been deleted and modern methods substituted This is particularly noticeable in the chapters on fractures, tumors, and vascular diseases The three volumes represent an excellent attempt to cover, for the student, the entire subject of surgery, from anaesthesia to the economic and social aspects of surgical treatment. Under the last mentioned heading, competitive practice, group practice, culture of the surgeon, etc, is briefly discussed

To those who are familiar with the text of the first edition and who enjoyed the detailed description of practically all surgical procedures of that date, the second edition, we are sure, will be gratefully received for Dr Smyth in collaboration with Dr Warbasse, has given us a three volume treatise which should serve the surgical profession and student as did the first edition

HEBERT T WIKLE

Infantile Paralysis and Cerebral Diplegia. Methods Used for the Restoration of Function By Elizabeth Kenny Octavo of 125 pages, illustrated Sydney, Australia, Angus & Robertson, 1937 (Philadelphia, P Blakiston's Son) Cloth, £1 1s 0d

The author wishes to create the idea that her methods of treatment are new This is unfortunate, as her methods are really well known, but very rarely used thoroughly as she advocates Her treatment differs from the orthodox treatment in that she creates and works under the most favorable conditions and equipment. Her favorable results are further enhanced because she provokes a cooperative response from the patient by a strong enthusiastic personality which she seems to possess, and which she instills in those whom she trains for the work. Her criticism of the so-called orthodox method of treatment is not true, as shown by her own quotations from leading medical authorities that she uses to stress the value of her methods

The book is valuable, however, in showing that a great deal can be done for paralytic patients when treated with intelligence, perseverance and interest, and by a strong personality who imparts his enthusiasm to the patient, thus obtaining the maximum cooperation

We would recommend that individuals, especially masseuse, masseurs and nurses who care for paralytics read this book.

JOSEPH B L'EPISCOPO

Hypnotic Power Its Cultivation, Use, and Application to Psychotherapy By Colin Bennett Duodecimo of 158 pages New York, E P Dutton & Company, 1937 Cloth, $1 50

There seems to be a re-awakening of interest in hypnosis Several articles and books have recently appeared for both lay people and physicians

The book under discussion is written apparently by a layman for lay consumption It tends to present some practical features about hypnosis and its different stages The presentation itself tends to stress the dramatic feature of the entire phenomenon, but the value of the book will depend upon its readers and the use to which they will put the knowledge gained from its perusal

IRVING J SANDS

Introduction to Clinical Psychology for Students of Medicine, Psychology & Nursing By Edward M Westburgh, Ph D Octavo of 336 pages Philadelphia, P Blakiston's Son & Co, 1937 Cloth, $3 50

This book has been written for the benefit of physicians amongst others, who may be interested in the correction of personality difficulties and in keeping individuals mentally adjusted

The opening chapter deals with historical data pertaining to psychology and psychoanalysis The next treats of test material, indicating the proper method of interpretation of the I Q Then follows a detailed discussion of the affective factors involved in personality, such as sense feeling and instinct feeling, sentiment and interest and various mechanisms

The second part of the book deals with some fundamental concepts of clinical psychology and is a presentation of the philosophic and theoretic structure upon which clinical psychology is based

The appendix contains an outline for the clinical study of personality, tests of ability

REVIEWED

Health Education of the Public A practical Manual of Technic By W W Bauer, M D and Thomas G Hull, Ph D Octavo of 227 pages, illustrated Philadelphia, W B Saunders Company, 1937 Cloth, $2 50

This book certainly should be valuable to the newcomer in the field of health education It covers all the media used, and discusses them pro and con Much of the material presented and the discussion thereof is in the nature of review to the person experienced in the dissemination of information to the public The book should be extremely valuable to physicians finding themselves on public health and relations committees of medical societies, and to physicians acting as advisors in health education to organizations such as schools, churches and the like

One is disturbed to find, in a book as small as this, errors in proof-reading, when preparation of material and its proof-reading is part of discussion in the book and its publishers have for years been noted for the excellence of their material

ALEC N THOMSON

The Little Things in Life The Vitamins, Hormones, and Other Minute Essentials for Health By Barnett Sure, Ph D Octavo of 340 pages New York, D Appleton-Century Company, 1937 Cloth, $2 50

"The Little Things in Life" by Dr Barnett Sure is one of the recent additions to the *Appleton Popular Health Series* It is the story of vitamins, mineral elements, and ductless glands in relation to nutrition and health of man told to the lay reader in non-technical language

This volume covers these fields in exceptional detail, and includes references to work done up to the time of going to press The author has made use of a large field of literature. He gives credit to individual workers by name and location, and makes free use of reference to his source material

The advisability of presenting the layman with such a large mass of information, some of which is controversial, is questioned Too much is written for the general public beyond their capacity to evaluate the facts presented.

The reviewer considers this volume an

diseases The latter includes New York City H L WEHRBEIN

The Principles and Practice of Clinical Psychiatry By Morris Braude, M D Octavo of 382 pages Philadelphia, P Blakiston's Son & Co, 1937 Cloth, $4 00

Comparing this little volume of practical psychiatry with the usual textbook, one must confess that it falls rather short of the mark. There is a somewhat curtailed and run-of-the-mine assembly of topics, but nowhere a coming to grips with the problems of psychiatry or the recent forward strides made in its progress This is perhaps best exemplified in a one line discussion of the incidence of schizophrenia as "the most common mental disease" Another glaring error is the quotation of quite recent and important contributions to the subject in the bibliography which are not even hinted at in the body of the text This has the fatal effect of outmoding the writing even before publication

On the other hand, the book tends more nearly to what the Germans are so fond of calling a compendium A practical and serviceable collection of the essentials of a subject should, however, be strictly pared down to the teachable and accepted facts Dr Braude serves them up with homilies or clinical asides which obscure the compendium character

It is the impression in this corner, that the author has summarily set down a short, practical course in clinical psychiatry and tried to fill in the skeleton with too little flesh

SAM PARKER

Tumors of the Nervous System An investigation of the Most Recent Advances Volume XVI of a Series of Research Publications of the Association for Research in Nervous and Mental Disease. Octavo of 493 pages, illustrated Baltimore, The Williams & Wilkins Company, 1937 Cloth, $7 50

This work comprises sixteen chapters, is fairly well-integrated, and deals with various phases of the tumor problem

An interesting chapter on the Meningiomas by Dr Joseph Globus contains a simplified classification of Meningeal Neoplasms The chapter dealing with the "Long Postoperative Survivals in Cases of Intracranial Tumor" deserves comment because of its hope producing quality and its tendency to allay the discouraged attitude towards brain tumors in general, so common in the medical profession

Most of the book deals with varied considerations of tumors of the brain Two chapters are devoted to the peripheral nerves Virtually no mention is made of neoplasms of the spinal cord, which in a book of this scope is a serious omission The volume is amply illustrated, a total of 213 plates and sixty-four tables being used Most of the plates deal with a histopathological portrayal of the tumors considered The chapter by Dyke and Davidoff relating to the pneumencephalographic diagnosis of tumors of the corpus collosum is clarified merely by excellent copies of appropriate x-ray films

On the whole, the publication attains the same level found in other volumes of the Association HAROLD R MERWARTH

The Cost of Adequate Medical Care. By Samuel Bradbury, M D Octavo of 86 pages Chicago, University of Chicago Press, 1937 Cloth, $1 00

In 1933 the Committee on Costs of Medical Care published Bulletin No 22 by Lee and Jones on the *Fundamentals of Good Medical Care* In that Bulletin the authors gave their definitions of the commonly used terms "adequate" and "scientific" medical care and insisted that the treatment desired was to be "good" not "ideal" The expected incidence of disease was calculated, and quantitative estimates of services required in the prevention, diagnosis and treatment of diseases and physical defects were made. Lee and Jones did not study the financial aspects of their subject

That part has been undertaken by Dr Samuel Bradbury, and is now published in this small book. For his study of costs he has used the minimum fee schedule adopted by the Chicago Medical Society in 1933-34 "The calculated number of services required for adequate medical care as defined by Lee and Jones multiplied by the corresponding minimum fees in the adopted schedule gives the estimated cost." In the study Dr Bradbury proves many interesting items The relative proposition of work devolving on the general practitioner and the specialist, the amount of time required of each to perform those duties, the hospital, nursing and laboratory needs and possible preventive care are reviewed The amounts of money that would (should?) be paid by a thousand people are submitted

Based on the standards given the "services for the care of diseases and defects" would cost $63 53 per person annually or approximately $9,500 000 000 for all the people in this country Forty-six per cent of this amount would be for physicians' cost Established preventive services would cost in addition $12 00 per person For the same services the Committee on Costs of Medical Care estimated $2,400,000,000 per

and achievement, interest and personality scales, and finally there is a selected bibliography

This book will be of use mainly to the physician interested in the field of behavior

STANLEY S LAMM

Artificial Fever Produced by Physical Means, Its Development and Application, By Clarence A Neymann, Associate Professor of Psychiatry, Northwestern University Medical School, Honorary Professor of Medicine, National University of Mexico, C.R.B Exchange Professor of the Universities of Ghent, Liege, Louvain and Brussels, Belgium Springfield, Illinois, Charles C Thomas, 1937 Pp 294 68 illustrations, 21 tables Price $6 00

Artificial fever for therapeutic purposes has been in the center of interest for several years and Dr Neymann was one of its pioneers He and Osborne were the first ones to demonstrate in 1929 the practicability of producing fever by high frequency current in man Neymann has worked with tireless energy since in the development of all phases of artificial fever treatment. His volume is both authoritative and critical The basic theories and principles of artificial fever treatment, its history, its physiology and technic are presented in the first chapters Separate clinical chapters deal with artificial fever treatment of dementia paralytica, syphilis of the central nervous system, primary and secondary syphilis, multiple sclerosis, chorea minor, arthritis, gonorrhea, asthma and other diseases and there is a bibliography of 556 articles on fever therapy The volume is well illustrated and typographically excellent, written in an engaging style by an excellent clinician it fills a very definite need and should be welcomed by general practitioners and specialists alike

RICHARD KOVACS

The Laboratory Diagnosis of Syphilis The Theory, Technic, and Clinical Interpretation of the Wassermann and Flocculation Tests with Serum and Spinal Fluid By Harry Eagle, M D Octavo of 440 pages, illustrated St. Louis, The C V Mosby Company, 1937 Cloth, $5 00

Animated by the current campaign for its eradication, the prominence of syphilis has caused many phases of the tests for its diagnosis to be subjected to more frequent and critical scrutiny The serologist and internist do not always concur This book should do much in clearing any such misunderstanding between laboratory worker and clinical diagnostician Serodiagnostic tests, spinal fluid examinations and other tests infrequently performed are considered fully within one cover together with practical discussions concerning their clinical evaluation The author's unity of development and clarity of expression make comprehensive a subject usually burdened with vagueness

Step by step critical analyses of the processes and materials underlying serodiagnosis of syphilis are developed through their historical perspective up to detailed technics, three complement-fixation and seven flocculation reactions being given Of major interest to the diagnostician and therapist, however, are those chapters analyzing directly the evaluating factors for diagnosis and continued therapy They should at least out-date many points of obsolescent belief continued and engendered by laggard and conflicting literature

The entire volume is authoritative, critically discriminating, and thorough The forty-two pages of bibliography indicate its completeness As a clear survey and as an indicator for further accomplishment, this book occupies a pre-eminent position in its field

IRVING M DERBY

Practical Methods in the Diagnosis & Treatment of Venereal Diseases For Medical Practitioners and Students By David Lees, F R C S Third edition edited and revised by Robert Lees, F R C P Duodecimo of 608 pages, illustrated Baltimore, William Wood & Company, 1937 Cloth, $5 00

Robert Lees, together with three other men from the Edinburgh Royal Infirmary, has edited and partially rewritten the original textbook on venereal diseases by David Lees It contains 300 pages on syphilis and 250 pages on gonorrhea Small sections are devoted to the lesser venereal diseases

The book will be of use to the medical practitioner who wants to know how to diagnose and how to treat venereal diseases It is expressly written for this purpose, it is free from theorizing and is filled with practical technical information

In the discussion of syphilis, stress is laid on the problems of diagnosis and therapy There are many excellent illustrations of the external pathological characteristics of the disease. Various antisyphilitic drugs are described (even the trade names are given) and their indications discussed

The section on gonorrhea covers this disease in the male as well as in the female and in children The concepts of the authors are in keeping with the present widely accepted principle of *nil nocere* Newer therapeutic methods are not included Hyperpyrexia is merely mentioned, and the sulfanilamide literature apparently came too late to be included in this edition.

There are two appendices, one a pharmacopoeia of arsenic and bismuth, and the other a list of treatment centers for venereal

diseases The latter includes New York City

POYTHRESS

AND PROGRESS

THE GROWTH of the POYTHRESS' laboratories within a comparatively short span of life, may only be credited to the confidence and respect won throughout the medical profession

Steady increase in prescribing and using POYTHRESS' products has continually forced expansion and enlargement of facilities, memorializing a service to medicine

Nothing short of the most exacting quality in drugs and efficiency in compounding useful remedies could have gained such results, nor earned the patronage of an enlargening circle of practicing physicians

POYTHRESS and PROGRESS have become synonymous

WILLIAM P. POYTHRESS & COMPANY
INCORPORATED
RICHMOND, VIRGINIA

MANUFACTURERS OF FINE PHARMACEUTICAL SPECIALTIES

year and listed costs per person varying from $10 84 to $30 00 for ill-defined "complete" care. The example of the author in offering clearly-defined terms, and in applying a definite schedule is very interesting to doctors, and should be to those social workers undertaking the revolution of medical practice Seeking increased medical services they decry and would diminish its quality for purely financial reasons, and would accept socialized medicine, State medicine or compulsory insurance schemes primarily to cut down the costs This book and its contained tables gives a very interesting and serviceable estimate of Cost of Adequate Medical Care on a fee for service basis

THOMAS A McGOLDRICK

Handbook of Hygiene for Students and Practitioners of Medicine By Joseph W Bigger, M D Octavo of 405 pages Baltimore, William Wood and Company, 1937 Cloth, $4 00

This volume fulfills the purpose for which it was intended, namely to supply information concerning hygiene and preventive medicine for students of medicine and general practitioners It discusses briefly, though completely, the elements of hygiene, and includes the phases of public health that are of practical value

Occupational hygiene is well discussed, and a chapter on Sanitation and Water Supply is especially valuable

This book is recommended for those who wish to familiarize themselves with hygiene and public health without taking time to delve through larger works

SAMUEL ZWERLING

A Mind Mislaid By Henry Collins Brown Octavo of 219 pages New York E P Dutton & Co, 1937 Cloth, $2 00

The book is written by a cultured gentleman who was one of the founders of the Museum of the City of New York and who had a definite psychosis later in life

He dedicates it to himself in admiration of his many engaging qualities He relates his experiences at the Westchester Division of the New York Hospital (Bloomingdale Hospital) in a vivid manner Many anecdotes relating to both patients and physicians are described It is an interesting narrative of his three years' residence in a mental hospital

The author has apparently grasped the outstanding characteristics of many of his physicians, and this makes fascinating reading for those who happen to know them

IRVING J SANDS

The Harvey Lectures Delivered Under the Auspices of The Harvey Society of New York, 1936-37 Series XXXII Octavo of 245 pages, illustrated Baltimore, The Williams & Wilkins Company, 1937 Cloth, $4 00

The series of lectures for this year, represent a compilation of important recent contributions to the physiology of metabolism, and studies of the nervous system with the elucidation in each lecture of its clinical application

Penfield in his lecture on *Cerebral Cortex and Consciousness* discusses his remarkable, experimental studies of brain localization, performed on the brain in the course of operation under local anesthesia

Landis summarizes his investigations on *The Passage of Fluids Through the Capillary Wall* He discusses the three factors which control the movement of fluids through membranes, the size of the filtering surface, the permeability of membranes, and the intracapillary pressure

Ranson's lecture on *Some Functions of the Hypothalmus* is a study of diabetes and the role of the hypothalmus in the control of the sympathetic nervous system

Schoenheimer, in a lecture on *Intermediary Metabolism,* presents a report of his investigations of this phenomenon with the aid of heavy hydrogen

The remainder of the series consists of papers by Madsen on the *Health Organization of the League of Nations,* Gasser on the *Control of Excitation in the Nervous System,* Long on *The Influence of the Pituitary and Adrenal Glands upon Pancreatic Diabetes* and Sir Henry Dale's excellent talk on the *Transmission of Nervous Effects by Acetylcholine*

WILLIAM S COLLENS

To Drink or Not to Drink. By Charles H Durfee, Ph D Octavo of 212 pages New York, Longmans, Green and Co, 1937 Cloth, $2 00

The phase of alcohol that is discussed in this book is as it relates to habit formation The author clearly points out the steps which lead the individual "to the escape." Understanding the drinker is the keynote of the volume, which devotes itself in a most serious attempt to impress the reader with the need for a sympathetic and humanitarian viewpoint in the care, treatment and reeducation, physical and mental up-building of the "problem drinker" This book is recommended to physician and layman alike, for it "offers insight hope and help to many drinkers, their families and friends"

SAMUEL ZWERLING

PACKARD LEKTRO-SHAVER

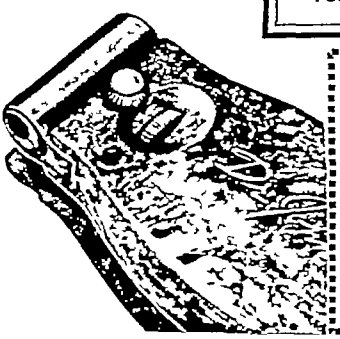
Packard Lektro-Shaver's surgically accurate, precision-made, smooth round head grooms many of Hollywood's million dollar faces And so efficiently that even the brightest studio lights fail to show any whisker-shadows Packard's 1938 shearing head has been vastly improved—engineered to new levels of consistent accuracy No shaver, that varies more than 1/5,000ths of an inch from standard, is permitted to leave the factory It's your face—why not shave it with the best—particularly when we are offering you a special

"PROFESSIONAL DISCOUNT"

Ask us how advantageously you can obtain a Packard Lektro-Shaver for your own use, engraved with your own name in your own handwriting Doctors everywhere are taking advantage of our special discount to physicians Send coupon for details

Nationally distributed by

PROGRESS CORPORATION
521 FIFTH AVENUE, NEW YORK, N Y



Packard Lektro-Shaver is manufactured by DICTOGRAPH PRODUCTS CO Inc precision manufacturers for 36 years

Why the Packard is Different

Four features account for Packard's superiority the smooth round head, the four-way cutter, the high speed motor, the rotating shaft drive The top of the round head forms two combs, whose teeth face one another, are separated by a narrow slot Inside is another slotted comb, the cutter The rotating drive, which terminates in an eccentric, drives the cutter back and forth and tilts it right and left at 15 000 RPM

Thus, shaving becomes merely the combing of the beard As the shaver advances, whiskers spring up in the open slot and pass into the spaces between the comb-teeth Then the inner cutter shears off each whisker squarely at the base The inner slot is slightly wider than the outer one—thus it is always open, preventing pinching or cutting As the space between the teeth of the outer comb is only a hair's breadth (.003"), the head passes harmlessly over facial eruptions or protuberances

Both logic and experience with millions of faces prove that the polished round head is the ideal shape for an electric shaver The scissor-like action of the cutter has conclusively demonstrated its ability to give a close, clean shave without pulling Both are exclusive, patented features found only in the Packard

IN SINUSITIS AND HEAD COLDS

when you prescribe a liquid vasoconstrictor, consider three points

1

PROLONGED EFFECTIVENESS

'Benzedrine Solution' produces a shrinkage which lasts 18 per cent longer than that produced by ephedrine

2

MINIMUM SECONDARY REACTIONS

On continued use 'Benzedrine Solution' produces practically no secondary vasomotor relaxation

3

REAL ECONOMY

'Benzedrine Solution' is one of the least expensive liquid vasoconstrictors

BENZEDRINE SOLUTION

Benzyl methyl carbinamine, S K.F., 1 per cent in liquid petrolatum with ⅛ of 1 per cent oil of lavender 'Benzedrine is the registered trade mark for Smith, Kline & French Laboratories' brand of the substance whose descriptive name is benzyl methyl carbinamine.

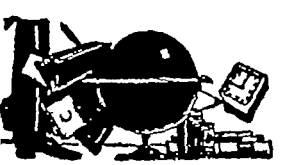
NOTES FROM OUR ADVERTISERS

"Benzedrine Sulfate" In Narcolepsy

Ulrich (N E. J Med. 217 696 Oct. 28 1937) makes a second report on the treatment of narcolepsy with Benzedrine Sulfate (benzyl methyl carbinamine sulfate S K F) Some of his patients have now had continuous treatment for nearly two years



Seven of the ten cases of narcolepsy were complicated by cataplexy All had complete or marked relief on administration of 'Benzedrine Sulfate' in doses varying from 10 to 60 mg a day the average daily dose being 25 mg In only one case was there an apparent tolerance developed. Cataplectic symptoms were particularly benefitted, and did not re-appear even after withdrawal of therapy

No evidence of permanent deleterious effects or habit formation was found Slight rise in blood pressure and basal metabolic rate was produced in some instances but these effects were transitory Anorexia and momentary discomfort were prevented by reducing the dose or changing the time of administration.

Two patients who suffered from obesity had an 11% loss of weight with Benzedrine Sulfate in doses of 20 to 30 mg a day This effect was not observed in patients of normal weight.

Ephedrine was tried in three cases of narcolepsy but was found to be of slight or no benefit. Dibenzyl carbinamine given to four patients failed to relieve narcoleptic symptoms and produced gastro-intestinal reactions especially in large doses

The author concludes that "Benzedrine Sulfate provides the only satisfactory treatment for narcolepsy but cautions against unsupervised use

CENTRAL VALLEY, N Y
Highland Mills 7885

Strengthen Mind and Character

It is not enough in these days of keen competition to train the mind alone. Boys and girls are being judged nowadays by their personality and character just as much as by their mental ability When choosing a school, this point must have full consideration. Does the school develop character? The public school gives a splendid intellectual training The private school goes far beyond that Its teaching staff is the product of many years of building The faculty members are chosen with scrupulous care, and changes are infrequent Here are men and women who know how to prepare the boy and girl for everything that is best in life Here is a school family, all working together, even in their recreation and social hours, to rise to higher and higher levels

Students are admitted only after personal interviews, so that undesirable elements are kept out, and the student's associations are of a high type Large classes, with mass-teaching, is unknown Classes of ten or fifteen students each are the rule, and each pupil has individual attention The faculty knows intimately how every one is progressing, and frequent reports keep the parents fully informed In many schools a character analysis is made periodically by the teachers, hall masters, athletic instructors, and other advisers, covering the student's industry, initiative, integrity, personality, leadership, versatility, and many other qualities This gives a check on each pupil by several teachers acting independently Together, they make a composite record useful to pupil and parents in helping to develop character on the right lines It is friendly and helpful cooperation of this sort that may mean the difference between success and failure in the after years

Travel and Resorts

A Date in Florida

Officials of the Seaboard Railway remind us that the 19th of February is an historic date for Florida, and particularly Jacksonville.

Almost 400 years ago this date, French Colonists under John Ribault set sail for the promised land of Florida after three unsuccessful expeditions had dampened the ardor of the Spaniards while religious persecutions were encouraging emigration of the Huguenots of France.

The first expedition under Ribault resulted in the birth of the Carolinas, but two years later under his leadership the Huguenots established a colony at the mouth of the St. John's River in Florida.

Visitors to Jacksonville on the West Coast Orange Blossom Special should see this river of extraordinary beauty From a source in the sawgrass country it flows north through many lakes, bordered at times with palms, moss-fringed oaks, pines and other semi-tropical vegetation, and covered in many places with water hyacinths

Flight Information

Ralph S Damon, vice-president in charge of operations of American Airlines, Inc, announces that now on their planes up-to-the-minute flight information is available to passengers while in the air

This information covers weather, air and ground speed, altitude, and position Mr Damon says that this is particularly to make the trip more interesting and enjoyable for the passenger and is in addition to the regular flight plan given out by the pilot for passenger use before each trip

His explanation of creating this new service, is that "the policy of American Airlines, Inc, is that passengers are entitled to any pertinent information he may desire relative to his flight or the conditions under which it is made" "We," declares Mr Damon, "have been working for more than a year on ways of making this information easily available and in such form that it can be readily interpreted by the passenger In this way, we believe a better understanding of air transportation will be gained by our passengers"

Doctor Is Champion Commuter

Britain's candidate for laurels as the world's champion commuter is Dr Thomas Phillips, an ophthalmic surgeon who lives at Harrow and works in London In his seventy-eighth year, Dr Phillips has been shuttling back and forth over the London, Midland and Scottish Railway for 58 years, hitting a total distance of 200,000 miles For long-service commuting in England, he tops his nearest competitors by seven and eight years "And there's never been a hitch," he twinkles

It Can Happen Here

Example of severe rickets in a sunny clime Courtesy of E. H Christopherson, M D., San Diego, and of "California and Western Medicine"

LEST WE FORGET—we who are of the vitamin D era—severe rickets is not yet eradicated, and moderate and mild rickets are still prevalent Here is a white child, supposedly well fed, if judged by weight alone, a farm child apparently living out of doors a good deal This boy was reared in a state having a latitude between 37° and 42°, where the average amount of fall and winter sunshine is *equal to that in the major portion of the United States* And yet such stigmata of rickets as *genu varum* and the quadratic head are plain evidence that rickets does occur under these conditions

How much more likely, then, that rickets will develop among city-bred children who live under a smokepall for a large part of each year True, vitamin D is more or less routinely prescribed nowadays for infants But is the antirricketic routinely administered in the home? Does the child refuse it? Is it given in some unstandardized form, purchased from a false sense of economy because the physician did not specify the kind?

A uniformly potent source of vitamin D such as Oleum Percomorphum, administered regularly in proper dosage, can do more than protect against the gross visible deformities of rickets It may prevent hidden but nonetheless serious malformations of the chest and the pelvis and will aid in promoting good dentition Because the dosage is measured in *drops*, Oleum Percomorphum is well taken and well tolerated by infants and growing children Rigid bioassays assure a uniform potency —100 times the vitamins A and D content of cod liver oil* Oleum Percomorphum, moreover, is a natural product in which the vitamins are in the same ratio as in cod liver oil*

Oleum Percomorphum offers not less than 60,000 vitamin A units and 8,500 vitamin D units (U S P.) per gram. Supplied in 10 and 50 c. c. brown bottles, also in 10-drop soluble gelatin capsules, each offering not less than 13,300 vitamin A units and 1,850 vitamin D units, in boxes of 25 and 100.

SANDALWOOD OIL THERAPY

ON WHICH YOU CAN DEPEND

YOU need no longer hesitate to use sandal wood oil medication for acute inflammations of the urinary tract The uncertainty and unreliability so often associated with ordinary sandalwood oil therapy are eliminated with Arheol, which is the purified active principle of sandalwood oil freed of therapeutically inert but irritating substances found in the crude oil. Arheol is all sesquiterpenic alcohol containing not less than 98% of santalol It may be prescribed to meet all the therapeutic indications for sandalwood oil

Use

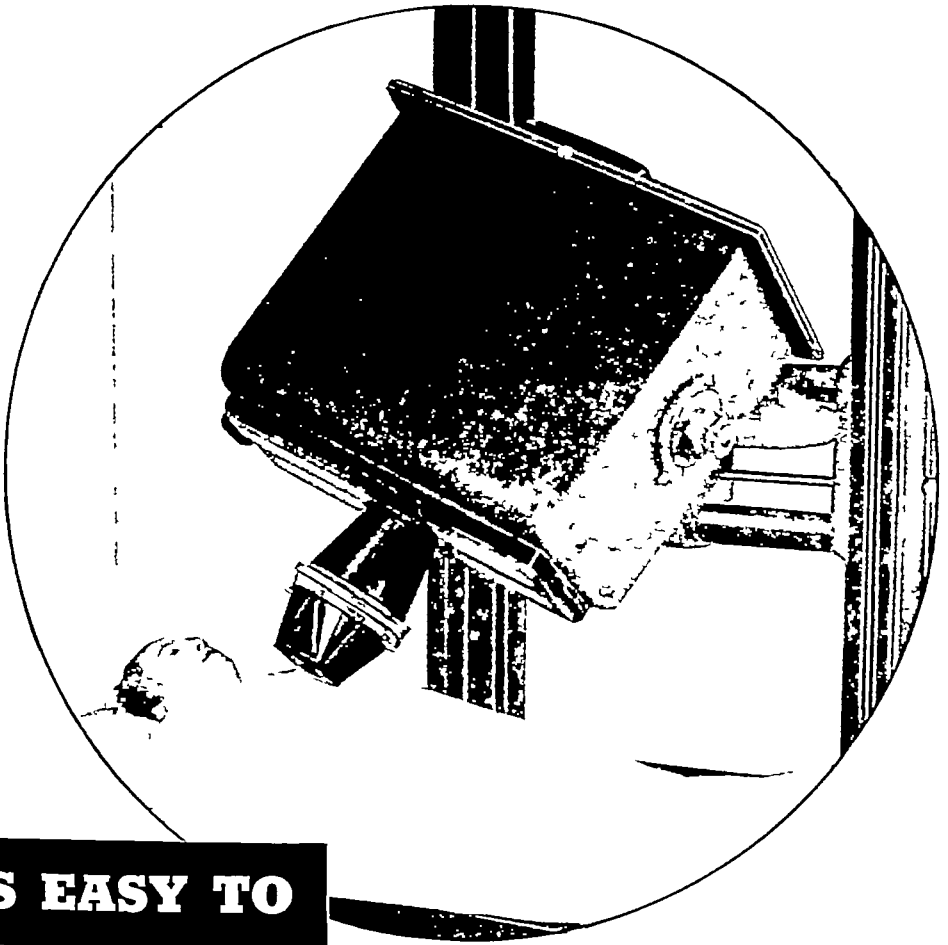
ARHEOL (Astier)

for GONORRHEA—All stages of gonorrhea—acute, subacute and chronic—are amenable to treatment with Arheol. In the acute stage, Arheol alleviates pain, reduces inflammation, lessens involvement of the posterior urethra, and diminishes the frequency of urination. In the chronic phase with involvement of the prostate and bladder, the beneficial effects of Arheol are still more apparent. Naturally Arheol is not recommended for use to the exclusion of local treatment when the latter is indicated.

ACCEPTED AMERICAN MEDICAL ASSN Council on Pharmacy and Chemistry

for CYSTITIS and VESICAL CATARRH

Since Arheol is antiseptic in both acid and alkaline urine, its use is helpful in inflammatory conditions of the urinary passages, whether or not they are of gonorrheal origin.



for PROSTATITIS and POSTERIOR URETHRITIS—In these conditions, Arheol is a useful adjunct to local treatment and the use of prostatic massage.

for PYELITIS and PYELONEPHRITIS

In these disturbances Arheol, owing to its dependable urinary antiseptic properties, is a definite aid in overcoming infection in the kidney and renal pelvis

GALLIA LABORATORIES, Inc., 254-256 W 31st St NEW YORK CITY

IT'S EASY TO EVALUATE

The G-E MAXIMAR "200" Shockproof Therapy Unit

IN laying your plans for a modern, efficient therapy service, you of course want to make certain that the x ray equipment you buy is thoroughly reliable, convenient to operate, trouble-free, and economical to use over a long period of time. In other words, equipment which will enable you to render the most creditable professional service.

If the experience of scores of users is a criterion, you can readily determine that a G-E Maximar therapy installation represents a logical, sound investment. You'll find it easy to get first hand information, because with G-E Maximars operating in all sections of the U S and Canada—in all parts of the world, in fact—one or more of these laboratories is no doubt conveniently available to you.

This offers you an opportunity to see before you buy—to learn how easy it is to accommodate the unusually compact Maximar in a small room, how complete oil-immersion makes this unit shockproof, dustproof, and moisture proof, how consistent operation is obtained despite variable climatic conditions or differences in altitude, to find many other reasons why the Maximar "200" has come into world-wide use within the short period of two years.

Without obligation, write for the illustrated catalog No. A-52, and a reference list of Maximar installations conveniently near to you.

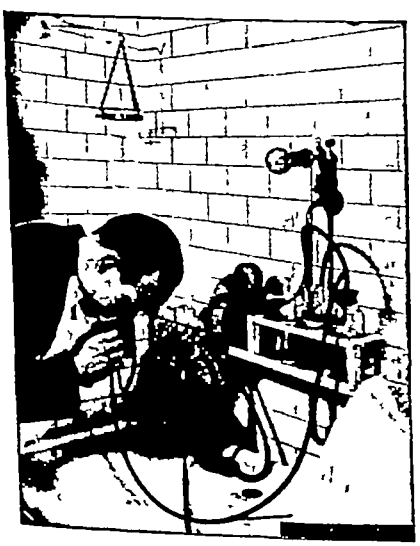
BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy.



KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

KALAK WATER COMPANY OF NEW YORK, INC., 6 CHURCH STREET, NEW YORK CITY

VITAMIN-A EFFICACY

. . . proved in the laboratory

Carefully controlled biological tests have proved that the vitamin-A efficacy of cod liver oil is enhanced twofold when it is emulsified with Maltine MALTINE WITH COD LIVER OIL, therefore, offers the physician not only an ideal vehicle for prescribing the vitamins A and D of cod liver oil, but also the added advantage of the valuable constituents of Maltine itself Another feature of MALTINE WITH COD LIVER OIL is that it has none of the unpleasant oily consistency and taste usually associated with vitamin-bearing oil This lack of taste is of particular advantage when prescribing for children

Another preparation favored by physicians is MALTINE WITH COD LIVER OIL and IRON IODIDE, containing two grains of freshly prepared iron iodide per fluid ounce The Maltine Company, 60 Hudson Street, New York City

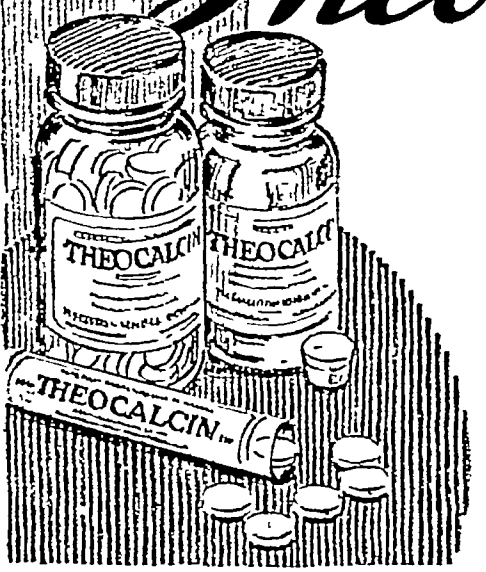
See the NEW GOMCO ELECTRIC ROTARY PUMP

at the N. Y. State Journal of Medicine Permanent Technical Exhibit

Features never before offered in pumps!



- Motor and compressor built into one compact unit—no visible moving parts—no danger of accident—only 3 points to oil every six months.
- Bottles recessed into base and held immovable for easy transportation. Readily removed by one thumb screw
- Exceptionally quiet ⅛ H.P motor More compact, occupies space of only 9" x 12¼" with total height of only 10"
- Pump capable of producing more pressure and vacuum than needed —therefore operates under maximum and will last longer
- New type positive felt filters for ether and vacuum lines easily replaced with removal of only three screws.

Available thru your regular surgical dealer

"... MOST EFFECTIVE METHOD KNOWN FOR THE TREATMENT OF *Gonorrheal Vaginitis* IN CHILDREN"

CONCERNING the management of gonorrheal vaginitis, Lewis[1] states "We consider the use of vaginal estrogenic suppositories the most effective method known for the treatment of gonorrheal vaginitis in children"

Other clinical studies serve to verify the findings of Lewis as to the value of Amniotin (Squibb Estrogenic Substance) in the management of this contagious infection

Treatment does not require hospitalization, may be administered by the mother or nurse under the physician's supervision The cost of medication is low and response is many times more rapid than methods hitherto available

Amniotin Capsules (1000 or 2000 International Units) or *Amniotin Pessaries, Children's Size* (1000 International Units) are the preferred dosage forms for treating gonorrheal vaginitis

Amniotin Capsules are supplied in boxes of 20 and 100 The *Pessaries* in boxes of 12

Amniotin is also used extensively in alleviating menopausal symptoms For initial phases of treatment, which frequently necessitate large doses, 1-cc ampuls of Amniotin in Oil are available in three potencies 2000, 10,000 and 20,000* International Units

For literature address Professional Service Department, 745 Fifth Avenue, New York

[1] Lewis and Adler *J A M A* 106 2054 1936
* The highest available potency of naturally occurring estrogenic substance.

MATERNITY SUPPORTS

One author* writes "A maternity corset not only aids in disguising the pregnancy figure but also is of great value in preventing a number of the complications of pregnancy. It should support the abdominal wall, the spinal column and the pelvic girdle By supporting the abdominal wall, it holds the growing uterus in place ... the contour of the abdomen wall will be better preserved.... With the back supported, the change in posture due to the forward displacement of the uterus is less fatiguing and many backaches are eliminated Similarly, support of the pelvic girdle prevents sacroiliac strain with its accompanying pain and backache"

• • •

The sections of Camp prenatal supports are brought firmly about the pelvis by means of the over-strap with its buckle and lacing device. When the pelvis (the base of the body) is thus perfectly fitted, the upright sections of the support will function without undue pressure upon the abdomen or back.

The support shown is designed for all types of build thin intermediate and stocky

How the Deaf Hear with CORONATION ACOUSTICON

This diagram of the ear will help you explain both bone conduction and air conduction to your patients Interestingly colored, it will look very attractive on the wall of your office We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD, the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE for custom fittings on the Aurogange and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service.

• HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS, but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye-glasses. Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations. Send us the names and addresses of these "hard to convince" patients Of course, your name will not be mentioned in our correspondence with them—unless you say so

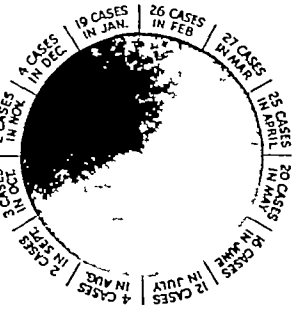
PROTECT NOW with TIME PROVED VIOSTEROL



By Abbott—Mead Johnson—Parke-Davis—Squibb—Winthrop

RICKETS flourishes during winter months Its mounting threat begins in September when solar ultra-violet falls to 3/8, and in December drops to 1/8 of its June 15 Vitamin D value Rickets increases its advantage now, in midwinter It reaches its peak in March

Viosterol therefore is needed most *now*, to aid and protect the normal growth and development of the bones and teeth of infants and growing children It provides equally valuable protection to mothers during pregnancy and lactation, assists in safeguarding the maternal mechanism against depletion of calcium and phosphorus while supplying the unborn and nursing infant with these requirements

Foundation-licensed Viosterol provides the physician with a trustworthy weapon for combating the all too-common dangers resulting from Vitamin D deficiencies It has a nine year record of demonstrated effectiveness. Its background of research includes thousands of infants and growing children It is produced by pharmaceutical houses of unquestioned integrity

When prescribing Viosterol specify time-proved Foundation-licensed Viosterol products by Abbott, Mead Johnson, Parke-Davis, Squibb or Winthrop

Above chart shows pictorially the variations of ultra violet rays of sun at Baltimore.** Figures indicate number of cases of rickets in a group of 160 Baltimore infants studied. Note that although the sun's rays are weakest in December rickets is most prevalent in March, a result of continuing depletion and inadequate supplies of Vitamin D.

For higher nutritive value plus assured purity

DAIRYLEA VITAMIN D MILK

● Says the A M A Council on Foods in a report in The A M A Journal of Jan 16, 1937, "Vitamin D milks have enhanced nutritive value for children and adults * * * vitamin D milk possibly has a greater usefulness for the child than for the infant because of the larger proportion of children than of infants who do not receive vitamin D from special sources"

And Dairylea Vitamin D Milk is a safe milk for the physician to prescribe Because it is an inspected-protected fresh, pasteurized milk—a milk that is safeguarded on the farm, and all the way to the home by the finest, most thorough methods of milk protection used in the industry.

All Dairylea Vitamin D Milk is fortified by 400 unit Vitamin D extract from cod liver oil (Vitex) Dairylea Vitamin D Milk is sold in Buffalo under the trade name of Weckerle, in Troy and Cohoes, it is sold under the trade name of Cloverleaf

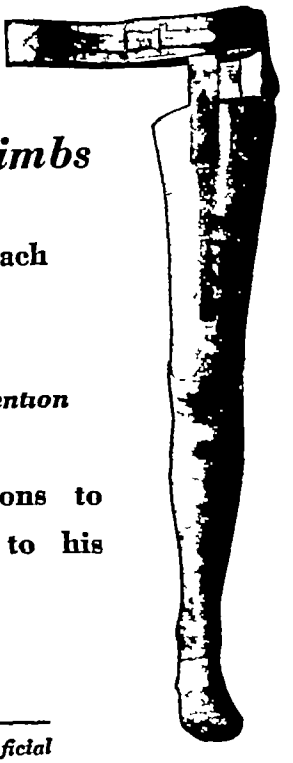
Our Pledge: We, the farmers of the Dairymen's League, recognize a definite obligation to the public. Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality

DAIRYLEA *Milk*

Produced by Dairymen's League Co-operative Association, Inc

milk

an aid in building resistance to colds



It is generally accepted that one of the best ways to ward off colds is to build up the general health with consequent greater resistance to illness In doing this, diet may play an important part Especially valuable in this type of diet is milk—extolled as the most nearly perfect food—whose importance as a health-builder has been known for centuries

In addition to these well known advantages, milk is also valuable in increasing resistance to specific diseases It is a good source of the anti-infective Vitamin A and also (because it contains calcium and other minerals alkaline in effect) milk helps to maintain the alkaline reserve of the blood Authorities recognize the importance of both these factors in decreasing susceptibility to colds *The Bureau of Milk Publicity, Albany*

THE NATURAL MINERAL WATERS OF SARATOGA SPA
ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK

In Conditions of Dehydration

the patient will find the *natural* carbonation of the Spa mineral waters a stimulus to ingestion These saline-alkaline waters, as will be seen from the accompanying analyses, are richly mineralized—more so, even, than many artificially mineralized waters The sodium content in the Spa waters is a valuable element in dehydration, as it aids in holding water in the body They replace the chlorides lost in vomiting or diarrhea Your patient will find Geyser Water especially palatable

Professional literature on the Waters is available to all interested physicians To those who wish to experiment clinically, a physician's sample carton of 4 bottles will be sent on request. Please write on your professional letterhead Address W S. McClellan, M.D., *Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y*

MAKING MILK FROM THE GROUND UP

The Best Milk Begins in the Good Earth—so that's where Walker-Gordon scientific control begins, enriching with special mineral-foods the soil that grows food for Walker-Gordon cows This makes their food richer in nutrients, helping in turn to make Walker-Gordon Certified a more nourishing milk.

This Machine Beats Nature—the usual sun-drying of cattle forage allows many food values to escape That's why Walker-Gordon, at the Plainsboro, New Jersey plant, has been the first milk producer to use this *dehydrator*—to remove moisture and *conserve* those food values Walker-Gordon cows get this most nutritious forage at all times So, in all seasons, Walker-Gordon Certified has a uniformly higher content of vitamins and minerals

We Look at Beauty with a Scientific Eye—Always the lovely dairy farm-lands of Walker-Gordon are under the sceptical, examining eye of the laboratory Here, for instance, the many foods grown for Walker-Gordon cows are constantly checked throughout the harvest season for nutritional value

Pennies For Health—Walker Gordon Certified—the milk made especially for children from nine months before birth to nine years after—is much lower than it used to be only a few pennies *more than that of ordinary milk* perhaps the cost of a newspaper

IN PEDIATRIC PRACTICE

It's Individualized Care

PROPERTIES OF KARO

Uniform composition
Well tolerated
Readily digested
Non-fermentable
Chemically dependable
Bacteriologically safe
*Non-allergic
Economical

*Free from protein likely to produce allergic manifestations.

ANTIPNEUMOCOCCUS RABBIT SERUM AS A THERAPEUTIC AGENT IN LOBAR PNEUMONIA

II Additional Observations in Pneumococcus Pneumonias of Nine Different Types

FRANK L HORSFALL, JR., M D, KENNETH GOODNER, PHD, and COLIN M MACLEOD, M D, *New York City*

From the Hospital of the Rockefeller Institute for Medical Research

The use of type specific antipneumococcus rabbit serum as a therapeutic agent in lobar pneumonia has been reported in previous papers [1,2] The various theoretical advantages of rabbit antiserum, the rationale which formed the basis for its clinical trial, and the results obtained in twenty-two cases of lobar pneumonia resulting from infection with pneumococcus Types I, II, VII, or VIII have been presented

Since the publication of these initial papers additional experience has been gained in the use of antipneumococcus rabbit serum Up to the present time sixty-seven patients have been treated with type specific antipneumococcus rabbit sera prepared in this laboratory

It is the purpose of this paper to present the results obtained in the entire group of sixty-seven cases of lobar pneumonia which have been treated with type specific antipneumococcus rabbit serum The group includes forty-five cases of lobar pneumonia which have not been previously reported, as well as the twenty-two cases described in an early paper Nine different types of pneumonia—I, II, III, V, VI, VII, VIII, XIV, and XVIII—have so far been treated with unconcentrated homologous antipneumococcus rabbit serum

Methods

Antisera Type specific antipneumococcus rabbit sera have been prepared and tested according to the technic described in a previous paper [3] It has been found to be desirable to heat the antiserum to 56°C for thirty minutes, and subsequently to absorb it with sterile kaolin for fifteen hours at 4°C in order to reduce chill producing substances It has also been found necessary to test the antiserum after it has been treated in the manner described, by the intravenous injection of two c c. in each of three normal rabbits, according to the technic described[3] in order to estimate the reduction in chill producing substances As was indicated previously[3] there is a very close correlation between the mean thermal reaction produced in normal rabbits and the extent of the chill reaction caused in human beings by the intravenous injection of antipneumococcus rabbit serum When antisera which had been treated by the method described did not cause a significant thermal reaction in rabbits, no chill reaction followed the intravenous injection of these antisera in patients with lobar pneumonia This correlation will be more fully discussed below

Cases The cases in this series have been an unselected group of patients with lobar pneumonia. In so far as it has been possible, the clinical study and the care of the patients has been identical with that outlined in the previous paper [2] A complete

Read in part before the Section on Pharmacology and Therapeutics at the Annual meeting of the American Medical Association, Atlantic City, June 10, 1937

GITALIN (AMORPHOUS)

(Formerly known as Verodigen)

A Glucosidal Constituent of Digitalis Purpurea

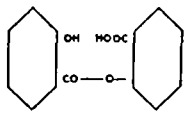
BIOLOGICALLY STANDARDIZED

Affording Accurate Digitalis Therapy Because of

- Rapidity of Absorption
- Uniform Potency
- *Comparatively Uniform Rate of Elimination*
- Scored Tablets for Better Dosage Regulation
- *Economy—Cost Comparable to Most Whole Leaf Preparations*

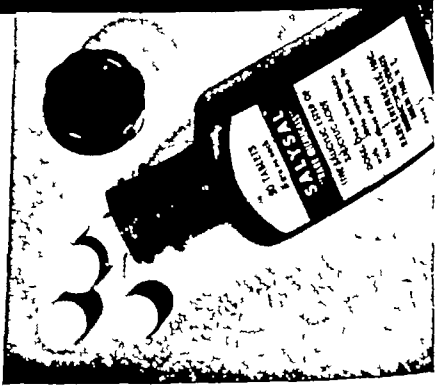
Each tablet segment is the therapeutic equivalent of 1½ grains of official digitalis.

SUPPLY As tablets in bottles of 25 and 100



RARE CHEMICALS, INC.

Medicinal Products of "Rare" Merit



NEPERA PARK, N. Y.

SALYSAL

"RARE CHEMICALS"

(THE SALICYLIC ESTER OF SALICYLIC ACID)

EFFICIENT SALICYLATE THERAPY . . . WITHOUT LOCAL GASTRIC IRRITATION . . . IN SMALLER DOSAGE

Analgesic • Antipyretic • Antirheumatic

Grain for grain SALYSAL is about twice as effective therapeutically as sodium salicylate, and is therefore employed in one-half the dosage of the latter drug Being an ester it is not broken down in neutral or acid media, and the irritating quality of free salicylic acid on the gastric mucosa is thereby avoided.

SUPPLY Tablets of 5 grains in tubes of 10, bottles of 50, 250, and 1000, powder in one ounce bottles.

c.c. have been given in this short period without producing discomfort. In the last fifty cases an effort has been made to give an adequate therapeutic quantity of antiserum in a single injection It has been found that the oral administration of acetyl salicylic acid just prior to the injection of rabbit antiserum, as was previously suggested,[8] is advisable even if the antiserum has been shown by intravenous tests in rabbits to be free of signficant amounts of chill producing substance

Of the sixty-seven cases of lobar pneumonia which have been treated with unconcentrated type specific antipneumococcus rabbit serum prepared in this laboratory, thirty-nine have been treated in the Hospital of the Rockefeller Institute, sixteen in the Harlem Hospital, six in the Babies Hospital, (New York City), two in the Albany Hospital, Albany, N Y, and one each in the New York Hospital, the Presbyterian Hospital (New York City), the Plainfield Hospital, N J, and the Middletown Hospital, N Y*

Because lobar pneumonia is not one disease, but a group of specific infectious diseases,[9] each of which has a different etiology and a different specific treatment, it is important to consider the patients treated with type specific antipneumococcus rabbit serum in groups according to the etiology of the infection

Type I

Twenty-five patients with Type I pneumonia have been treated with unconcentrated Type I antipneumococcus rabbit serum This group includes the ten patients with Type I pneumonia previously reported [2] In Table I are presented the chief facts concerning this group of cases with lobar pneumonia It will be observed that of the twenty-five, only four were females

The average age of the group was thirty-three years, and included in the series are two children aged six and eight years respectively Consolidation of two or more lobes occurred in nine cases, and in four cases it was bilateral Type I pneumococcus bacteremia was present in eleven cases Pleural exudates infected with Type I pneumococci were encountered in two cases Type I antipneumococcus rabbit serum therapy was begun on an average of seventy-seven hours after the onset of the disease, in two cases it was delayed for 220 and 330 hours respectively

Four patients in this series had been found to be extremely hypersensitive to *horse* serum In two of these four patients there was no evidence of hypersensitiveness to rabbit serum, while the other two were markedly hypersensitive to both horse and rabbit serum Even in the latter two cases, however, it was possible to give full therapeutic quantities of rabbit serum intravenously in a relatively short period of time This was accomplished by the following technic Into the tube of a continuously flowing glucose-saline intravenous infusion increasing quantities of diluted rabbit antiserum were injected The initial rate of 0001 c.c of antiserum per minute was doubled every ten minutes, and in this way within a period of three hours the full quantities of antiserum were given without any reaction

In the whole group a mean quantity of 134 c c of unconcentrated Type I antiserum was injected intravenously per case The average time which elapsed between the intravenous test dose and the completion of serum therapy in the last twenty-two cases has been but five hours

The acute signs of the disease, as judged by the temperature, pulse and respiratory rates, have disappeared on the average nineteen hours after the institution of serum therapy Thirteen cases received an adequate therapeutic quantity of serum in a single intravenous injection and in this group the average period from the beginning of serum therapy until the completion of crisis was but seven hours

The two patients with infected pleural exudates must be considered separately Both of these cases had Type I pneumo-

*We wish to express our sincere appreciation for the courtesy and generous cooperation that has been shown us by the staffs of these various institutions We are particularly grateful to Dr Harriet Alexander, Dr Richard T Beebe, Dr Jesse G M. Bullowa, Dr John B Caffey, Dr Howard R Craig, Dr Yale Kneeland, Jr., Dr Rustin McIntosh, Dr Thomas Ordway, Dr Dan Witt, Dr Arthur W Wright, and Dr F Howell Wright for their kindness in allowing us to publish the results of the treatment of their cases with unconcentrated antipneumococcus rabbit serum.

physical examination was made immediately after admission to hospital The physical signs indicating consolidation of one or more lobes of the lung were confirmed by x-ray examination The pneumococci in the sputum were typed by the Neufeld technic and subsequently the type was confirmed by mouse inoculation Blood cultures were taken shortly after admission and repeated as frequently as was desirable As soon as the type of pneumococcus in the sputum had been determined, tests for sensitiveness to rabbit serum were carried out

Tests for Sensitiveness

1 Intradermal test The initial experience concerning the frequency with which falsely positive skin tests are encountered after the intradermal injection of 1 c c. of a 1 10 dilution of normal rabbit serum into human beings,[2] has been confirmed by subsequent testing No reliance has been placed on the results of the intradermal test because of the commoness of false positive reactions when rabbit serum is used A markedly positive test occasionally occurs in patients subsequently shown not to be sensitive to rabbit serum on intravenous injection It is believed, on the basis of preliminary tests, that the number of false positive reactions can be reduced by substituting normal serum diluted 1 100

2 Conjunctival test This test is carried out by instilling 0 1 c.c of a 1 10 dilution of normal rabbit serum into one conjunctival sac. While this test has been of little aid in forming judgment as to sensitivity, a positive reaction would be taken as an indication that all subsequent procedures should be undertaken with the greatest caution

3 Intravenous test The intravenous test however, has been found to be entirely satisfactory and no patient in the entire series of sixty-seven patients has been found to show any evidence of sensitiveness to rabbit antiserum in whom the intravenous test was negative. In four instances, more fully described below, both the clinical history and previous tests with *horse* serum indicated marked sensitiveness to the serum of this species In two of these four cases the intravenous test with rabbit serum was entirely negative, and in both of these patients a full therapeutic dose of antiserum was given in one injection without the production of untoward symptoms In the other two cases, however, the intravenous test with rabbit serum was strongly positive Despite this fact, it was possible to give a full therapeutic dose of rabbit antiserum intravenously by beginning very slowly with extremely dilute antiserum, and with great caution gradually increasing the concentration of the serum injected

For the intravenous test for sensitiveness it has been the routine practice to inject 1 c.c. of the therapeutic rabbit antiserum to be administered, diluted to five c.c. with physiological saline. Although this quantity of serum injected intravenously as a test dose, caused no reaction in sixty-five patients, it was large enough to produce a moderately severe reaction in the two patients who gave definite histories of allergy and were known to be sensitive to horse serum It would undoubtedly be safer, as a routine, slowly to inject intravenously 05 c.c. of rabbit antiserum diluted to five c c with physiological saline. In cases where a suggestive history of allergy is elicited, or where hypersensitiveness to the serum of another species is demonstrated, it would seem wise to inject not more than 01 c c of rabbit antiserum diluted to five c.c

A positive reaction to the intravenous test is manifested by a decrease in the arterial systolic pressure of fifteen mm. of Hg or more, and an increase in the cardiac rate of fifteen beats per minute or more, both occurring within five minutes or less after the injection of the test dose of antiserum The test, under the conditions stated, gives distinct and sharply defined results In sixty-five cases the intravenous test was entirely negative, that is there was either no change in the arterial pressure and the cardiac rate, or the alterations in both were so slight as to be insignificant On the other hand, in two cases the test was markedly positive as manifested by the usual rapidly occurring and dramatic signs of mild shock, accompanied by a sharp fall in arterial pressure and a marked rise in cardiac rate In none of the sixty-five patients in whom the intravenous test was negative did there develop symptoms suggesting any sensitiveness to rabbit serum during or after the administration of the full therapeutic dose

Administration of antiserum One half hour after the intravenous test for sensitiveness to rabbit serum had been shown to be negative, the therapeutic administration of antiserum was begun Undiluted antipneumococcus rabbit serum has been given intravenously throughout these studies The rate of injection of the antiserum has been quite rapid in most instances One hundred and twenty c c of antiserum may be injected safely intravenously in ten minutes As much as three hundred

c.c have been given in this short period without producing discomfort. In the last fifty cases an effort has been made to give an adequate therapeutic quantity of antiserum in a single injection It has been found that the oral administration of acetyl salicylic acid just prior to the injection of rabbit antiserum, as was previously suggested,[8] is advisable even if the antiserum has been shown by intravenous tests in rabbits to be free of signficant amounts of chill producing substance

Of the sixty-seven cases of lobar pneumonia which have been treated with unconcentrated type specific antipneumococcus rabbit serum prepared in this laboratory, thirty-nine have been treated in the Hospital of the Rockefeller Institute, sixteen in the Harlem Hospital, six in the Babies Hospital, (New York City), two in the Albany Hospital, Albany, N Y, and one each in the New York Hospital, the Presbyterian Hospital (New York City), the Plainfield Hospital, N J, and the Middletown Hospital, N Y*

Because lobar pneumonia is not one disease, but a group of specific infectious diseases,[9] each of which has a different etiology and a different specific treatment, it is important to consider the patients treated with type specific antipneumococcus rabbit serum in groups according to the etiology of the infection

Type I

Twenty-five patients with Type I pneumonia have been treated with unconcentrated Type I antipneumococcus rabbit serum This group includes the ten patients with Type I pneumonia previously reported [2] In Table I are presented the chief facts concerning this group of cases with lobar pneumonia It will be observed that of the twenty-five, only four were females

The average age of the group was thirty-three years, and included in the series are two children aged six and eight years respectively Consolidation of two or more lobes occurred in nine cases, and in four cases it was bilateral Type I pneumococcus bacteremia was present in eleven cases Pleural exudates infected with Type I pneumococci were encountered in two cases Type I antipneumococcus rabbit serum therapy was begun on an average of seventy-seven hours after the onset of the disease, in two cases it was delayed for 220 and 330 hours respectively

coccus bacteremia The first was a male of fifty-seven years Serum therapy was commenced on the third day of the disease Type I antibody of rabbit origin became demonstrable in the pleural exudate, and subsequently the pneumococci disappeared Empyema did not develop The second patient was a male, aged six Serum therapy was commenced on the ninth day of the disease The infection of the pleural exudate was not controlled and empyema necessitating surgical drainage developed Serum sickness occurred in two cases

Twenty-four cases recovered and one died, a mortality rate of four per cent The single death in the series occurred in a male aged fourteen, three hours after the onset of an extremely severe chill reaction

Type II

Ten patients with Type II pneumonia have been treated with unconcentrated Type II antipneumococcus rabbit serum This group includes the four patients with Type II pneumonia previously reported [2] In Table II are presented the salient facts concerning this group of cases It will be noted that of the ten patients, three were females and seven were males The average age of the group was forty years Consolidation of two or more lobes occurred in three cases Type II pneumococcus bacteremia was present in one case Pleural exudates infected with Type II pneumococcus were encountered in two cases

Type II antipneumococcus rabbit serum therapy was commenced on an average of sixty-eight hours after the onset of the disease It seems important to point out that two cases in this series were in the fourth day of the disease, while two

other cases were in the sixth day when Type II rabbit serum therapy was begun A mean quantity of 225 c c of unconcentrated Type II antiserum was injected intravenously per case The acute signs of the disease, as indicated by the temperature, pulse and respiratory rates, disappeared on an average of forty-nine hours after the institution of serum therapy Serum sickness occurred in six cases.

The two patients with infected pleural exudates must again be considered individually In one patient, a male of nineteen years, serum therapy was begun on the third day of the disease Type II antibody of rabbit origin became demonstrable in the infected exudate and subsequently the pneumococci disappeared Empyema did not occur In the other patient, a female of sixty years, serum treatment was started on the third day of the disease The infected exudate did not become sterile and empyema, necessitating surgical drainage, developed

Nine cases recovered and one died—a mortality rate of ten per cent The single death in this series occurred five weeks after the onset of the disease and resulted from the rupture of an aneurysm of the thoracic aorta into the empyema cavity

Type III

Thirteen patients with Type III pneumonia have been treated with unconcentrated Type III antipneumococcus rabbit serum In Table III are presented the results obtained in this group of cases Of the thirteen patients, three were children aged two, five, and six years All three children had bilateral Type III otitis media The average age of the ten adult cases was fifty-four years Among the thirteen cases there were seven with consolidation of two or more lobes Four cases had Type III pneumococcus bacteremia One pleural exudate infected with Type III pneumococcus was encountered Auricular fibrillation occurred in four patients, and eight were sufficiently ill to require oxygen therapy

Serum therapy was instituted on an average of fifteen hours after the onset of the disease A mean quantity of 320 c.c. of unconcentrated Type III antipneumococcus rabbit serum was given to the ten adult cases, and 129 c.c. to the three children In those who recovered, the acute signs of the disease disappeared at an average of seventy-nine hours after the beginning of serum therapy Serum sickness occurred in six patients

Seven patients recovered, and six patients died—a mortality rate of forty-six per cent The three children were among the patients who recovered One adult female of fifty-two years, who had Type III pneumococcus bacteremia, also recovered

Two patients deserve special attention The first was a male of forty-five, who besides being alcoholic was admitted in a moribund condition on the seventh day of the disease This patient had Type III pneumococcus bacteremia and empyema, and lived for only eighteen hours after admission The second was a female of seventy-two, who, eighteen hours after the injection of 281 c c of antiserum sustained a critical drop to normal in temperature, pulse and respiratory rates This state was maintained for thirty-eight hours, at the end of which time the blood pressure rose sharply to 220/140 The patient had been known to have had hypertension prior to the development of pneumonia Shortly after the sudden rise in blood pressure there developed signs of an intracerebral hemorrhage and death promptly followed

Type V and VI

One case of Type V pneumonia and two cases of Type VI have been treated with unconcentrated homologous antipneumococcus rabbit serum The chief findings in these three cases are shown in Table IV The ages of these three patients were two years, thirteen and fifteen months respectively All had consolidation of two or more lobes Both cases with Type VI pneumonia had Type VI pneumococcus bacteremia In two cases, one of Type V and the other of Type VI, homologous pneumococcus empyema was present before serum therapy was started, and in the Type VI case the empyema was bilateral In the other Type VI case there was a pleural exudate infected with Type VI pneumococcus In each instance antipneumococcus rabbit serum therapy was commenced very late in the disease

The interval which had elapsed from the onset of the disease until serum was injected was thirteen days, five and nine weeks respectively The average quantity of unconcentrated rabbit antiserum which was given intravenously was 113 c.c. per case After the administration of antiserum bacteremia disappeared in both Type VI cases, there was a striking clinical improvement within twenty-four hours In the Type V case there was as definite but less rapid improvement Serum sickness did not develop in any of these cases Both of the patients in whom empyema was present before serum was administered, underwent rib resection and surgical drainage of the infected pleural cavity In the other case, in which the pleural exudate was infected with Type VI pneumococcus, the pneumococci disappeared from the exudate after the administration of antiserum and empyema did not develop All three cases recovered

Type VII

Six patients with Type VII pneumonia have been treated with unconcentrated Type VII antipneumococcus rabbit serum This group includes three patients with Type VII pneumonia previously reported[2] The more important facts concerning this group of cases are shown in Table V The average age in this group was forty-eight One patient had consolidation of two lobes, and another had Type VII pneumococcus bacteremia One patient developed auricular fibrillation

On an average, serum therapy was commenced fifty-five hours after the outset of the disease In two patients serum was not administered until the fourth day of the disease A mean quantity of 160 c c. of unconcentrated Type VII rabbit antiserum was injected intravenously per case The acute signs of the disease disappeared on an average of seventeen hours after the institution of serum therapy Two patients received an adequate therapeutic quantity of antiserum in a single injection In these two cases the periods from the administration of serum to the completion of crisis were nine and eight hours Serum sickness developed in five. All six recovered

Type VIII

Seven patients with Type VIII pneumonia have been treated with unconcentrated Type VIII antipneumococcus rabbit serum This group includes five with Type VIII pneumonia previously reported[2] The chief findings in this group of cases are shown in Table VI The average age of the group was forty Consolidation of two lobes occurred in two patients, and Type VIII pneumococcus bacteremia occurred in two other patients Serum therapy was begun on an average of thirty-five hours after the onset of the disease A mean quantity of 160 c c of unconcentrated Type VIII rabbit antiserum was injected intravenously per case. The acute signs of the disease disappeared on an average of nineteen hours after the institution of serum therapy Three cases were given an adequate therapeutic quantity of antiserum in a single injection and in these cases the average interval from the administration of serum to the completion of crisis was nine hours Serum sickness developed in four All seven recovered

Type XIV and XVIII

Two patients with Types XIV and one with Type XVIII pneumonia have been treated with unconcentrated homologous antipneumococcus rabbit serum The salient facts concerning these cases are shown in Table VII The two patients with Type XIV pneumonia were fifty-three and twenty-five years of age respectively The patient with Type XVIII was twenty-one years of age and was sufficiently ill to require oxygen therapy All three patients had consolidation of but one lobe Bacteremia was not present in any of the cases In the cases with Type XIV, serum therapy was begun on the second and the fourth day after the onset of the disease To these two cases, 360 and 180 c c. of unconcentrated Type XIV rabbit antiserum were given The acute signs of the disease disappeared sixty and forty-nine hours after the beginning of serum therapy Both patients recovered Serum sickness did not occur In the Type XVIII case, serum therapy was begun forty-eight hours after the onset of the disease and 332 c c of unconcentrated serum were given intra-

venously The acute signs of the disease disappeared twenty-four hours after the administration of serum The patient developed serum sickness, but recovered

Discussion

In a discussion of the results obtained with type specific antipneumococcus rabbit serum as a therapeutic agent in lobar pneumonia, it seems best to consider separately a number of points

Antipneumococcus rabbit serum, irrespective of type, frequently contains sufficient chill producing substances to cause severe reactions when injected intravenously in patients with lobar pneumonia These reactions are not usually dangerous, but when extreme hyperpyrexia results as occurred in one instance in this series, severe symptoms may occur and death may follow despite active antifebrile therapy It has been found[3] that the greater part of the chill producing substances can be removed from antipneumococcus rabbit serum by relatively simple procedures, that is by heating it to 56° C for thirty minutes and subsequently absorbing it with sterile washed kaolin for fifteen hours at 4° C It has also been found[3] that the extent of the mean thermal reaction which follows the intravenous injection of two c c of antipneumococcus rabbit serum in each of three normal rabbits, very closely parallels the severity of the chill reaction produced in human beings by the intravenous injection of the same serum With this additional information it has been possible to restudy many of the various lots of antiserum which have been used therapeutically and to correlate the results previously obtained in human beings with those produced by the same sera when tested intravenously in normal rabbits Sera which produced a mean thermal response of less than 1 2° F after intravenous injection into three normal rabbits did not cause chill reactions when given intravenously to human beings Sera which caused a mean thermal response of more than 1 3° F in rabbits did cause chill reactions in human beings and the severity of the chill was approximately proportional to the degree of thermal elevation produced in rabbits

Forty different lots of antipneumococcus rabbit serum comprising the nine different types of antiserum have been used in these studies. A few patients have received two separate lots of homologous antiserum Of the forty lots of antiserum, fourteen were entirely untreated, while twenty-six were treated in the manner described above Of these latter treated lots, there were eleven which did not produce a significant thermal response after intravenous injection in normal rabbits In Table VIII are shown in condensed form the experiences with untreated and with treated rabbit antiserum It will be noted that the fourteen untreated lots of antiserum were injected in thirty-one patients, and that twenty-four of these patients had one or more chill reactions, an incidence of seventy-eight per cent Of these fourteen untreated lots of antiserum, one hundred and sixty-seven injections were given to the thirty-one patients, and produced forty-six separate chill reactions, an incidence of twenty-seven per cent

It will also be observed that the twenty-six lots of treated antiserum were injected in fifty-one patients, and that nineteen of these patients had one or more chill reactions, an incidence of thirty-seven per cent. Of these twenty-six treated lots, one hundred and thirty-nine injections were given to the fifty-one patients, and produced twenty-one separate chill reactions, an incidence of fifteen per cent Eleven of the treated lots of antiserum were shown by intravenous test in rabbits to cause no significant thermal response These eleven lots of antiserum were injected in twenty-six patients and did not cause a chill reaction In all, forty-nine injections of these eleven lots were given without producing a single chill These observations lead to the conclusion that the simple procedures previously mentioned definitely reduce the chill producing property of antipneumococcus rabbit serum They also indicate the importance of testing the antiserum by intravenous injection in normal rabbits At the present time no other method is known which will distinguish the potentially chill-producing rabbit antisera from those which will not cause such reactions

Serum sickness is one of the unpleasant sequelae of serum therapy and al-

though it is not serious it is capable of producing moderately disagreeable symptoms for a period of a few days In a discussion of the occurrence of serum sickness after the administration of antipneumococcus rabbit serum, it must be borne in mind that unconcentrated rabbit antisera have been used throughout this study It would therefore be illogical to make any comparative statements concerning the incidence of serum sickness after the administration of antipneumococcus sera from a species other than the rabbit, except when reference is made also to *unconcentrated* sera In the last 100 cases of Type I pneumonia treated in the Hospital of the Rockefeller Institute with *unconcentrated* Type I antipneumococcus horse serum, serum sickness occurred in over ninety-five per cent of patients MacKenzie and Hanger[4] have reported a serum sickness incidence of ninety per cent after the injection of similar horse antiserum in patients with lobar pneumonia. Of the fifty-nine patients who were treated with antipneumococcus rabbit serum and who recovered, twenty-four developed some evidence of serum sickness, an incidence of forty per cent In sixteen cases the symptoms were mild, and in eight they were of moderate severity In seventy-five per cent of cases in which serum sickness did develop it manifested itself almost entirely by cutaneous symptoms—urticaria, transient rashes, etc The development of serum sickness was not related to the quantity of serum administered In three patients more than 300 c c of antiserum were injected without the subsequent occurrence of serum sickness

Prior to a discussion of the remainder of the points which have been raised by this study it will serve a useful purpose to separate the cases with Type III pneumonia from those with the other eight types of pneumonia, and to discuss the Type III cases first As has been the case with antipneumococcus sera produced in other species, and as is still true even with rabbit antiserum, there is considerable difficulty in preparing highly potent antiserum against Type III pneumococcus. Certain factors underlying this difficulty are now fairly well understood[5] Whether this can be entirely surmounted is a question which must be left to the future It is apparent from a consideration of the results obtained in the first thirteen cases of Type III pneumonia treated with Type III antipneumococcus rabbit serum, presented in Table III, that as yet no definite evidence exists that antiserum of this type has been of benefit in Type III pneumonia In the discussion which follows, therefore, the cases of Type III pneumonia will be excluded from the consideration

In Table IX are presented in summary the chief facts concerning fifty-four cases of lobar pneumonia of eight different types, which have been treated with unconcentrated homologous antipneumococcus rabbit serum

It will be observed that consolidation of two or more lobes occurred in eighteen cases, or thirty-three per cent of the fifty-four cases treated It has been adequately demonstrated by Cecil, Baldwin, and Larsen[10] that the mortality rate in nonserum treated cases is significantly increased as each additional lobe is consolidated In this series of cases, all eighteen with multilobar consolidation who were treated with homologous antipneumococcus rabbit serum have recovered

Pneumococcus bacteremia was present in seventeen cases, thirty-one per cent of the fifty-four cases treated It has been well shown by Tilghman and Finland[6] and Bullowa and Wilcox[7] that in nonserum treated cases in which bacteremia occurs the mortality rate is markedly increased In this series of cases, one patient with bacteremia (Type II pneumococcus) died, and sixteen patients recovered, a mortality rate of 5 9 per cent among the cases with pneumococcus bacteremia

Pleural exudates infected with pneumococci were encountered in seven cases in this series of fifty-four, an incidence of thirteen per cent Two of these seven, one with Type V pneumonia and another with Type VI, had frank empyemas before serum therapy was commenced There remain five cases with infected exudates which had not progressed to the stage of empyema at the time serum therapy was begun In three of these cases following the administration of antiserum, type specific antibody of rabbit origin became demonstrable in the exudates and subsequently the pneumo-

cocci disappeared In two other cases with infected pleural exudates, antibody was not demonstrated in the exudates after the administration of rabbit antiserum, and empyema developed which necessitated surgical drainage Finland[8] has shown that horse antibody can penetrate the inflamed pleura but was unable to demonstrate homologous antibody when the pleural exudate was infected with pneumococci

The rapidity with which recovery occurred after the administration of an adequate quantity of rabbit antiserum to patients with eight different types of lobar pneumonia has been one of the most striking findings in this study In the fifty-four cases the average interval from the beginning of serum therapy until the disappearance of the acute signs of the disease was but twenty-seven hours A total of eighteen patients received an adequate quantity of antiserum in a single injection, and in this group the interval from the beginning of serum therapy until the completion of crisis was only seven and one-half hours Although there may not be any distinct advantage in very rapid recovery *per se*, nevertheless the fact that recovery can be brought about so rapidly as has been indicated, is additional evidence of the specificity and the effectiveness of the therapy employed

It is apparent that the most important criterion of the success of any therapeutic measure in the treatment of a frequently fatal disease is the reduction in the mortality rate which can be attributed to the use of that agent As a result of the numerous reports[9-13] of very large series of cases of lobar pneumonia not treated with antiserum, the mortality rates to be expected in many of the various types of the disease are clearly known The increased mortality rates which occur in the presence of either multilobar consolidation, or pneumococcus bacteremia are also well-established In this series of fifty-four cases of lobar pneumonia of eight different types, treated with unconcentrated homologous type specific antipneumococcus rabbit serum, despite the occurrence of multilobar consolidation in thirty-three per cent of cases, and pneumococcus bacteremia in thirty-one per cent of cases, there were but two deaths, a mortality rate of 3 7 per cent

Summary

1 Sixty-seven cases of lobar pneumonia, distributed among nine different types, have been treated with unconcentrated type specific antipneumococcus rabbit serum

2 In thirteen cases of Type III pneumonia no evidence of the therapeutic effectiveness of Type III antipneumococcus rabbit serum was demonstrated

3 In fifty-four cases of pneumonia due to eight other types of pneumococcus and treated with antipneumococcus rabbit serum of homologous type, the mortality rate was 3 7 per cent.

NEBRASKANS CLING TO LIFE

A bill to legalize euthanasia was recently rejected by a committee of Nebraska's new unicameral legislature. Sponsored by a woman physician, the bill provided that any adult person suffering from a painful or incurable disease might apply to a district judge for the appointment of a commission consisting of two physicians and a lawyer to study the case and recommend action. If death was advised, and the decision approved by the judge, the attending physician could administer the lethal stroke

INCONTINENCE OF URINE IN THE FEMALE

Study of the Urethral Sphincter Under Hydrostatic Pressure with Roentgenograms—Sphincter Mechanism, Loss of Control, Restoration

WILLIAM T KENNEDY, B A, M A, M B (TOR), L M C C, F A C S,
New York City

From the Clinic of the Woman's Hospital

This study includes only cases of incontinence of urine where inefficiency of the sphincter control has developed

The vaginal wall and bladder, from cervix to symphysis may appear between the vulvae, and the posterior two-thirds of the urethra may turn through a right angle, yet there will be normal continence of urine On the contrary, little apparent damage to the anterior vaginal wall and the urethra may be seen, but, all the urine will escape through the urethra without the patient's having any sensation of voiding or control A patient may be operated upon to correct a cystocele and develop a partial loss of urinary control

Without doubt, incontinence of urine with complete loss of sphincter control is the worst gynecological affliction which can come to any woman It is worse than a vesicovaginal fistula where sphincter control is normal, for, thanks to J Marion Sims—whose efforts were instrumental in founding the Woman's Hospital eighty-two years ago—we know how to cure a vesicovaginal fistula But patients have been operated upon again and again for loss of sphincter control without results A few of these patients have been relieved by continually wearing a pessary fitted in the vagina to make upward pressure against the urethra The remainder have become subjects for ureteral transplanting operations which carry a moderately high mortality I emphatically appeal to you that any degree of incontinence demands our serious attention if we can consistently help them.

Here, the urologist becomes the gynecologist's most important aid He should explore the bladder, ureters, and kidneys, and treat pathological conditions when present Then, when only sphincter incontinence remains, I honestly believe we can render consistent relief

Several types of operations have been devised (1) Transplantation of adjacent muscles under the urethra to exert urethral constriction, and with this type of operation one links the names of Selheim, Pean, Goebel, Stoeckel, Taussig, McGaw, Douglass, Deming, Miller, and H Martius, (2) Plication of the posterior urethral wall by mattress sutures (Kelly stitch) with which one links the names of Ward, Farrar, Rawls, and Noble, (3) Plication of the bladder and urethra walls with which one links the names Watson, Bonney, and Davies, (4) Suprapubic plication of the superior vesical neck of the bladder, devised and performed by H Dawson Furniss

Results

Reports of results and failures are taken from three papers H A Kelly and William M Dumm reported on twenty cases of incontinence with success in sixteen (80%) and complete failure in four B P Watson, reporting on 105 cases followed after operation, had complete success in 65 7 per cent (2 out of 3), in 21 9 per cent the control was better than before operation, and in 12 4 per cent (1 out of 8), there was no improvement

H Dawson Furniss reports his results in twenty-one cases, eight being minor in character, nine having marked

The author wishes to express his appreciation to Dr George Gray Ward, Chief Surgeon of the Woman's Hospital for allowing him to undertake this study, to Dr Edward A. Bullard for having assigned so many cases to him, and to Dr Joshua W Davies for his help in clarifying the anatomy

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

incontinence, and four having complete incontinence In his follow-up four of these patients were not heard from Of the seventeen cases, six were mild, all of which were successes, of seven who had marked incontinence, five were successes, one was a partial success, and one was a failure, of the four with complete incontinence, two were successes one was moderately benefited, and one was a failure In the seventeen cases, thirteen were complete successes or 76 5 per cent, while two were failures or 12 9 per cent

My results, compared with any of the above, were very much inferior so I began to study the urethrae of some of my failures, making roentgenograms to record and analyze

Method of Obtaining Roentgenograms

A new apparatus was designed[1] A metal tube, six cm long was taken and a rigid arm attached at one end Rotating about it was a guard, which, when in contact with the tube, could be kept close to the external meatus of the urethra. The guard was so placed that the tube could extend one cm into the urethra The sac, a two-layer membrane—the outer fishskin, the inner very thin rubber—was about 2 5 cm in diameter when fully dilated and firmly attached to the tube at the point where the guard came in contact with it The length of the sac was about 5 5 cm Connected to the other end of the metal tube was a rubber tube leading to the manometer The manometer, connecting tube and sac were filled with a twenty-five per cent solution of sodium iodide and the level of the surface of the solution in the manometer above the level of the urethra measures the pressure in the sac Strongin suggested that pictures of the bladder should be taken at the same time, consequently 200 c c of a three per cent solution of sodium iodide was put in the bladder before the sac was put into the urethra To insure a uniform manometer pressure in that portion of the sac in the bladder a section of a ureteral catheter, with a metal collar at one end and a cork for the other, was made which ran from one end to the other[2]

Steps in Making Picture

(This step is illustrated in the author's article which appeared in the *American Journal of Obst & Gyn*, January 1937) Prepare the patient as for a cystoscopic examination Introduce a catheter to allow all urine to run out of the bladder, then introduce 200 c.c of three per cent solution of sodium iodide through the catheter into the bladder and remove the catheter Pass the obturator D into the tube C[1] to elongate the sac S Pass the sac S into the urethra and bladder until the guard G presses against the external meatus Attach a twenty c c. Luer syringe filled with a twenty-five per cent solution of Sodium Bromide to F, the end of D Empty the contents of the syringe into the sac, simultaneously withdrawing D Attach the manometer tube to metal tube. Raise the manometer tube to obtain the desired pressure in the sac Each picture obtained reveals separately the contour of the bladder and the contour of the urethra, since the solution in the bladder has different opacity from the solution in the sac. The relationship of the bladder to the urethra can be observed and at the same time the pressure in the sac is always at right angles to surface, consequently at right angles to the inner surface of the urethra The pressure in the urethra is equal and opposite in direction to the force exerted at right angles to the urethral sphincter muscles as they contract to prevent the escape of urine from the bladder When the pressure in the sac is varied, one can arrive at an estimation of the efficiency of the sphincter control The involuntary sphincter control is mainly exerted by fibers about and near the internal and external thirds of the urethra For arbitrary reasons in this paper, the urethra has been divided into an inner, a middle, and an outer third, and the efficiency of the sphincter about each portion estimated Pictures were made at different pressures when a patient was relaxed (R throughout), i e, when she made no effort to void and no effort to hold her urine

The Normal Competent Sphincter

To determine the action of the normal urethra, the author selected a patient, aged twenty-three, who complained only of sterility, she had no dysuria, nor nocturia, but had a retroverted uterus The pictures taken of this patient's urethra and bladder[3] are consequently of a normal urethra and bladder, and were made when she was relaxed, i e, making effort neither to hold her urine nor to void The

pressure in the sac was varied, and pictures were taken at twenty, thirty, forty and eighty cm It will be noted that the first indication of the internal sphincter's dilating takes place between thirty and forty cm fluid pressure The middle third of the urethra does not begin to dilate until a pressure between forty and fifty cm is reached, is not nearly stretched at fifty cm, and still has some sphincteric control at eighty cm of pressure For purpose of comparison then, the normal urethral sphincter will exert a constricting force of about thirty cm of water before any dilatation takes place

The Super-Competent Sphincter

This sphincter is one which was accidentally discovered in a patient forty-three years of age with no incontinence It was very difficult to catheterize her and only a small catheter could be passed Pictures were made at ten, twenty, and fifty cm fluid pressure[4] The inner third does not dilate at fifty cm pressure The stricture very much enhances the involuntary muscle and will prevent it from any damage that might injure the ordinary urethra.

The Incompetent or Damaged Sphincter

This patient was in the hospital first in 1933 and complained of incontinence of urine for previous eight years She

U Position of internal meatus urethra.

U O Position of ureteral orifices

The bladder and urethra were separated from the anterior vaginal wall by a dissection beginning at the cervix and extending to within about 1 5 cm of the external meatus This dissection was carried laterally to both pubic rami The posterior urethra seemed to be too near the pubic rami, so by blunt dissection, hugging closely to the pubic ramus on the right, all connections between the urethral wall and the ramus were severed and the dissection carried back to the paravesical space One could now see the lateral wall of the bladder (Fig 1)

A similar dissection was done on the opposite side Three mattress sutures (1, 2, 3) of #0 chromic catgut were placed as shown in Fig 2 and tied

Three similar mattress sutures (4, 5, 6), overlapping the previous ones, were placed as shown in Fig 3 and tied Care must be taken to place sutures 4 and 5, in the smooth, tensile, fascia-like tissue on the wall of the urethra The function of these mattress sutures is to prevent

had had eight full term pregnancies, the last in 1923 No repairs were done at delivery Incontinence had become progressively worse She wore a pad constantly and any walking or straining caused leakage When lying down there was little loss of urine Wassermann was four plus, urine negative, *operation* dilatation and curettage, amputation of cervix, operation for incontinence (Kelly stitch), operation for cystocele, rectocele, and lacerated pelvic floor Still had incontinence when she appeared for her ninth

Restoration of Control

Since the operation described has been followed by a reasonable degree of success, one may say that the deduction regarding the loss of control and the sphincter mechanism are intimately linked together and that unless we free the involuntary sphincter and restore the retracted voluntary fibers, we cannot expect to get consistent results

Results

Thirty-five patients have been operated upon by the above method Six of these patients who were previously operated upon for incontinence, with failure, were all restored to continence by the above method

Four who had lost all sensation of voiding or control were restored to continence

Twenty-five had degrees of incontinence varying from mild to moderately severe (sufficient to make it their chief complaint) Of these, twenty-two were restored to continence, one (whose anterior vaginal wall broke down after operation) was considered a failure soon after leaving the hospital however, she improved and three months after operation was going about her daily routine being continent for two hours at a stretch, one who was continent when discharged, after three months contracted a cold, had extreme urgency and frequency and was unable to reach the toilet without some loss of urine, one developed a very marked frequency after operation (at cystoscope was found to have a congested urethra), was continent and could reach the toilet without loss of urine

Conclusions

1 The greater part of the sphincter mechanism which is intimately related to continence of urine is situated in or about the inner third of the urethra.

2 The sphincter mechanism consists of a free involuntary sphincter muscle surrounding the inner third of the urethra, enhanced and supported by a sling of voluntary muscle fibers (anterior levator) which unite in a median raphe beneath the inner portion of the urethra

3 When a woman who has never had a labor begins to suffer a partial incontinence of urine there has been an incomplete union of both the voluntary and involuntary fibers of the sphincter mechanism during fetal development

4 Labor may injure (a) separately the involuntary sphincter muscle by directly or indirectly causing it to become distorted and fixed to the ramus of the pubis by cicatricial fibers, thereby markedly diminishing its function as a sphincter, (b) separately the voluntary sphincter by splitting its fibers parallel to the urethra so that these ends retract from the median raphe to weaken its support, and (c) conjointly (a) and (b)

5 A method which will restore continence to all those who had been previously operated on for incontinence and those who had lost all sensation of voiding or control is worthy of consideration

6 Results justify the deduction of the sphincter mechanism and the loss of control

7 Although our knowledge of the whole sphincter mechanism is not yet complete, progress has been made.

MATCH INHALER FOR COLDS

A friction match for treating colds has been invented by Alfred Schmid of Berlin-Dahlem, reports the American chemical journal *Industrial and Engineering Chemistry*. The device consists of a small glass rod coated with absorptive charcoal which contains a carefully measured amount of iodine The tip of the match is covered with an incandescent mantle of easily ignited iron When this covering is ignited, iodine vapor is created and can be inhaled directly The inhaler can be carried in the pocket.

—*Science News Letter*

further reattachment of the posterior urethra to the pubic rami and to draw under the urethra the fascia-like structure which has never been damaged

The vaginal mucosa was now trimmed before suturing When traction is made on the point (Fig 4), and the finger placed behind the symphysis, fibers in this structure seem to pull from a point laterally and posteriorly on the symphysis, doubtless from near the end of the white line Three silver wires (7, 8, 9)—#7 passing through the "dimple" in the vestibule and embracing all the retracted supporting tissue—were passed in through the vaginal mucosa of the vestibule and out at corresponding points on the opposite side to approximate the vestibule The anterior vaginal wall was now closed with interrupted catgut sutures The silver wires were twisted and their ends fastened in a lead shot and turned into the vagina * (Fig 5)

A retention catheter (#16 male) was left in the urethra twelve days After removal the patient voided and was continent The silver wires were removed and the patient went home continent Seventeen months later the patient is still continent

Fifty-two days after the operation another roentgenogram was made [6] The correction seems almost normal

Analysis of Control

Roentgenograms were made of the bladder and urethra before the silver wires were removed [7 8] When one places the "white lines" in the drawings and draws heavy lines from the medial ends of these "white lines" through the silver wires one sees that we have a sling for the inner third of the urethra The lines correspond in origin to levator fibers—which are striped or voluntary—and pass into a median raphe

Sphincter Mechanism

An ideal functioning involuntary muscle is the circular muscle of the ileum which is suspended, sling-like in the mesentry Here we see a similar anatomical analogy, the involuntary sphincter muscle surrounding the inner third of the urethra suspended in a sling of voluntary muscles (levator) [9] This, I believe, normally constitutes the *sphincter mechanism* about the inner third of the urethra.

Loss of Control

By a prolonged passage of the head through the pelvis in labor, by rotation of the head impinging on the symphysis

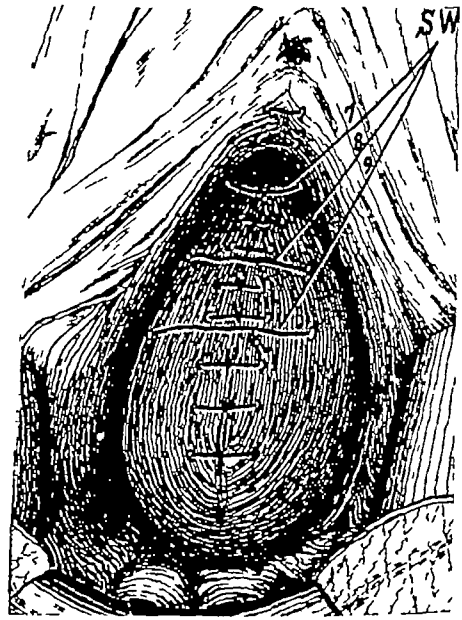

Fig 5 All sutures tied Interrupted catgut sutures approximate margins of vaginal flaps Silver wire sutures are approximated and twisted to hold voluntary sphincter fibers Vaginal wall closed with interrupted No 2 chromic catgut.

or ramus (1) the posterior urethra may become damaged by contusions in the wall In the process of organization the involuntary sphincter becomes distorted and drawn over to the ramus by fine cicatricial bands and its efficiency becomes impaired All degrees of impairment have been observed even to dense scar tissue attaching the posterior urethra to the posterior of the ramus of the pubis (2) The sling-like suspension—doubtless containing levator fibers—becomes stretched or lacerated in or near the midline and the muscle and elastic fibers retract toward the symphysis, thus greatly impairing the sling-like support [10]

*The vaginal mucosa was closed without inclusion of the urethral wall, the idea being to make this support simply a sling in which the urethra could swing

of what the ideal examination may be there are practical limitations which must be taken into consideration more especially when one is thinking of the laboring group or men hired on the job and whom there is no opportunity to examine under the advantageous conditions existing in a company medical office permanent or improvised In the larger cities, especially in the east, a large part of the heavy manual labor is done by the men who are hired by a foreman or subforeman without previous notice Absence of others from the job or defections or necessity for an increased force must be taken care of at once if the work is to go on and it is common for laborers to present themselves on the job for hire, sometimes sent by the individual whose place they are taking Irrespective of union affiliations or not most of these are not known to the foreman and unless he does know them he has nothing but a sketchy recommendation of some sort and his own appraisal of the man's physical ability to guide him in selection The importance of training foremen, about which I shall say something more later, is evident

So far as history goes (I refer to a medical history) its value can certainly be discounted in such a problem as we are considering Even under the best of conditions and dealing with intelligent patients, histories are notoriously imperfect and unreliable

There is also another element which has to be given weight in job seekers well-illustrated by the remark once made to me by the Medical Director of a large life insurance company He said, "We have a million policy holders and not one was sick even a day in his life and all their people died of old age" In this matter of history, however, there is one very sound question that is apt to be answered truthfully and that is, "What work have you been *doing* for the past few months or what was your last job?" Any foreman can tell whether the answer is reliable and deduce the implications as to physical ability

Let us consider what are the essentials of physical condition one wants to determine. *First*, the prospective employee should at least appear well and fit for the job to the layman's eye I use the rather vague term "well" because of the fact that both thin and fat men, young and old, ruddy and pale, are all suitable for different types of jobs provided they are at the time well persons of their type In a recent paper by Dr L M Deardorf on physical examinations of construction employees on P W A work he speaks of twenty rejections amongst eighty-five men examined and several of these are good examples of this first point, one having evidence of intemperance and a large tumor on his shoulder, one very nervous, two with only one eye, one too frail, two too young, and one too old for the type of heavy construction work for which they were offering

Any ordinarily observant layman and especially one accustomed to observing men at work, even if he had never taken thought to analyze the matter, should at once notice evidence of debility or recent substantial weight loss, true obesity, tremors or spasticity or ataxia or gross speech defects as well as automatically to have registered in his mind an impression as to whether the job candidate is normal, alert and well-poised in his demeanor or dull, slow, agitated, listless or rummy

The *next* general point which one must consider is gross deformities Here again the margin in selection is wide A man with a stiff knee or even one leg or a stiff elbow might be entirely suitable for a particular job On the other hand a man with even a slight limp might be definitely unsuitable if he had to be on his feet all day or patrolling

Thirdly, deafness is perhaps the best example of a comparable kind of impairment In most jobs it is probable that a man will work in relationship to others and it is important that he hear their orders or warnings or be aware of approaching vehicles or other objects On the other hand a man may be quite deaf and none of these considerations apply and there is no reason why he be denied the opportunity to make a living Eyesight falls in somewhat the same class

One finally comes to another class of conditions which at first glance may appear an insuperable hurdle—those relating to the heart, lungs, and kidneys Some reflection however I think will show that this is not so Any of you who are familiar with the work of Dr George Draper and have seen him deduce from

THE PROSPECTIVE OUTSIDE PLANT EMPLOYEE

Practical Brief Physical Appraisal

EDWARD S MCSWEENY, M D, *New York City*

"The underlying policy of the Bell System with regard to examinations for employment is not to secure an exceptional selected group of persons as to mental and physical condition but simply to exclude those who would be a hazard to themselves or others should they be employed or who present definite defects which would unfit them for the position which they seek

"The preliminary interview with the departmental employer results in some eliminations on the score of this last factor For instance, a person with a stiff leg, glass eye, loss of hearing, or other gross defect

"The typical examination at the Medical Office is made immediately after satisfactory interview with the departmental employer after the applicant's previous personal history has been recorded by a nurse as well as temperature, weight and pulse The examinations are such as any competent physician having in mind what is required would be able to do in his own office with the stethescope, blood pressure apparatus, eye chart and such equipment They are not carried to the length of x-rays, audiometer tests, electrocardiograms, serology or the like

"Indicating compliance with the fundamental policy noted above the reasons for rejection are always substantial and further indicating this, practically all applicants accepted show some minor defects, poor health habits or other conditions which should be corrected Should it develop at the medical examination that an employee presents some particular defect which unfits him for the position for which he is applying but mentally and physically he is suited for other employment, this is noted so that if another position is open he may be considered for it Following employment the correctable conditions noted at the time of examination are made a subject of follow-up at intervals of a few months with the idea of stimulating the employee to give them attention The following are examples of reasons for rejection

Severe deafness	Ruptures
Excessive blood pressure	Skin diseases
Pregnancy	Disabling heart and kidney trouble
Bad vision	Active tuberculosis

"This policy, although a broad and liberal one, has been followed by the New York Telephone Company over twenty years and has involved the acceptance or rejection of many thousands of applicants and has been found to be on the whole satisfactory The Company could, by being more stringent, doubtless secure a general average of employees of a higher mental and physical standard but the thought has been to accept a fair cross-section of those in the community applying for employment and not to seek only the exceptionally favored Such a practice, rather than a more exclusive one, doubtless carries with it some penalties but it has been felt, from the standpoint of public policy, it was one we should follow"

* * *

I am reading the above statement as the beginning of my discussion of this subject as it appears to me that one must settle this question of the fundamental approach to the problem before one can intelligently discuss any application of methods

In many organizations I am aware that the matter of recommendation or approval of applicants is approached from a different standpoint and involves a much more rigid selection after searching examination provided it can be made. Particularly has this been advocated with regard to tuberculosis cases Our experience does not lead us to follow this course

That some sort of examination for outside plant forces is desirable, I think there can be no question Whatever one's ideas

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

tory managers could practice such selection with profit

If one has the opportunity and can economically make a regular medical examination it is to be preferred and of course is essential for certain occupations such as compressed air and many others When you can't, a carefully thought-out simple program practically applicable to the hiring conditions is far better than none at all

Even under the most extreme conditions a foreman who has some notion of what he should look for from the standpoint of physical ability and compensation liability can make a better selection than one left entirely to his own original thoughts in this matter or those which only his personal experience has taught him

TRANSFUSIONS

Preliminary Study

LEON N SUSSMAN, M D, *New York City*
Assistant Transfusionist, Beth Israel Hospital

This study is undertaken in an attempt to evaluate the benefits of small repeated transfusions versus single large transfusions in cases of severe infections, sepsis, meningitis, sinus thrombosis, etc The cases of acute hemorrhage are purposely omitted as the indications here are definite and noncontroversial Various phases of the problem will be taken in order, hemoglobin-sustaining aspect, the immunological aspect, the bone-marrow stimulation or depressing aspect, and other problems that suggest themselves It is hoped that from this study will evolve a method of calculation for the proper volume of blood to be transfused to provide the optimum response on the part of the patient

Case Reports

CASE 1 I R., (Chart I) a ten year old boy with a history of otitis media and mastoiditis, was admitted to the service of Dr S J Kopetzky at Beth Israel Hospital on February 25, 1937 A mastoidectomy was performed on the following day The patient made an uneventful convalescence and was sent home He returned to the hospital on March 8 with signs of meningitis and petrous pyramid infection With the onset of this infection the hemoglobin fell to seventy-four per cent The petrous pyramid was opened and drained by Dr Kopetzky, following which a transfusion of 150 c c. was given The infection subsided and the hemoglobin remained stationary until March 16 when there was another fall to seventy per cent and the signs of meningitis reappeared At this time an apicotomy was performed by Dr Kopetzky Repeated small transfusions were then given and the hemoglobin reached a plateau of seventy-five to eighty per cent. Convalescence was uneventful until April 14 when there was another marked fall in the hemoglobin with recurrence of the signs of meningitis The petrous tip was re-exposed by Dr Kopetzky Following this, small transfusions were given every other day for two weeks This was accompanied by a gradual and continuous rise in the hemoglobin until one hundred per cent was reached. All signs of the infection had subsided and the patient was discharged

This case shows clearly that with the continuance of the infection there is a progressive fall in the hemoglobin This fall can be successfully combated by repeated transfusions to maintain the hemoglobin at a fairly normal level. Furthermore this case denoted that the end of the infection is characterized by a marked and continuous rise in the hemoglobin which is self-sustaining There seems to be no bone-marrow depression in evidence even though this patient received a total of 1000 c c of blood over a period of two weeks

CASE 2 B K (Chart II), an eight year old female admitted with a history of mastoiditis to the service of Dr Kopetzky, during this period of infection the hemo-

From the Service of Dr S J Kopetzky, Department of Otolaryngology, Beth Israel Hospital

inspection and a few simple questions without the aid of any of the usual medical man's diagnostic maneuvers and apparatus, accurate, and complete diagnoses, will more readily appreciate what I have in mind There is no better measure of the practical state of a man's heart and lungs than his actual demonstrated ability to tolerate physical exertion The most valuable test which any cardiologist applies is the functional test People are disabled by symptoms, not pathology—a truth much neglected as medicine and medical teaching tends to be mechanized In the great majority of cases a lack of evident hoarseness, wheezing, cough, dyspnea, cyanosis or edema will answer the question satisfactorily for employment To be sure it will not disclose what a careful stethoscopic and urinary examination will, but even with these some are missed and let us not forget that still more accurate examination methods such as a blood chemistry would disclose cases not so detected So the matter is after all a relative one The greatest weakness as regards this particular group of organs is the compensation hazard—not the employment one The percentage however of cases filing claims on this basis is small and employment is in the rule not continuous

Labor lists serve a useful purpose as only carrying the names of men already tested and at least obviating the risk of dealing with unknown individuals They can, when practicable, be built up from candidates examined under more leisurely and favorable conditions or even in a regular medical office, but this is not what we are talking about. From the field point of view their chief value is that noted—lists of those known for their performance

A collateral matter which might be mentioned is the practice somewhat in vogue if employment is continued over more than a temporary period of having a regular medical examination at convenience when it will not interfere with the job progress This is especially justifiable if the employee, after a certain time, becomes eligible to sickness or other benefits or promotion is in question

I have endeavored to set forth the medical elements of the problem, now we come to its final and most important aspect—practical application To be of any value I think this must rest upon some training of foremen. Most so-called instruction of foremen that I have observed is the bastard off-spring of psychology and high pressure salesmanship damned by both its parents and mostly twaddle I would hate to be classed as an advocate of it Anyone who knows many foremen realizes that teaching them anything about their job had better be approached humbly and with a full appreciation of how much better schooled they are in practical matters than almost any other group in the community But it has been my observation that when you present this to them as part of a medical program in which they can participate, their attitude is much the same as towards first aid and their cooperation whole hearted One needs only to point out what to look for and a simple routine to follow and can be sure of good application We have even found it a simple matter to use a frayed cable with different colored wires as a color test when it was necessary A few questions but the right ones, observation of a few things but again those that count, a few simple agility and strength tests, and all but very few will be eliminated of those whom I said at the beginning of this paper constitute a hazard to themselves or others or are definitely unfit for the job

I will not go into details or the matter of forms of record because we have not time nor is it necessary as many are available I would only say in closing to interpret any you come across and think of using in the light of common sense and the limitations of employment on the job One can ask any man anywhere to pull up his trouser legs to see if there be varicose veins but cannot, for instance, ask a man at 42nd Street and Fifth Avenue, New York City to drop his trousers so you can see if he has a hernia as you might do in a more secluded spot But one can frisk him for a truss and incidentally perhaps find a flask Language is not a difficulty of any importance

What I have said I believe applies to the whole group of casual labor and to semi-skilled and skilled men whether working outside or in though I have had the former particularly in mind Fac-

tory managers could practice such selection with profit.

If one has the opportunity and can economically make a regular medical examination it is to be preferred and of course is essential for certain occupations such as compressed air and many others When you can't, a carefully thought-out simple program practically applicable to the hiring conditions is far better than none at all

Even under the most extreme conditions a foreman who has some notion of what he should look for from the standpoint of physical ability and compensation liability can make a better selection than one left entirely to his own original thoughts in this matter or those which only his personal experience has taught him

TRANSFUSIONS

Preliminary Study

LEON N SUSSMAN, M D, *New York City*
Assistant Transfusionist, Beth Israel Hospital

This study is undertaken in an attempt to evaluate the benefits of small repeated transfusions versus single large transfusions in cases of severe infections, sepsis, meningitis, sinus thrombosis, etc The cases of acute hemorrhage are purposely omitted as the indications here are definite and noncontroversial Various phases of the problem will be taken in order, hemoglobin-sustaining aspect, the immunological aspect, the bone-marrow stimulation or depressing aspect, and other problems that suggest themselves It is hoped that from this study will evolve a method of calculation for the proper volume of blood to be transfused to provide the optimum response on the part of the patient

Case Reports

CASE 1 I R, (Chart I) a ten year old boy with a history of otitis media and mastoiditis, was admitted to the service of Dr S J Kopetzky at Beth Israel Hospital on February 25, 1937 A mastoidectomy was performed on the following day The patient made an uneventful convalescence and was sent home He returned to the hospital on March 8 with signs of meningitis and petrous pyramid infection With the onset of this infection the hemoglobin fell to seventy-four per cent. The petrous pyramid was opened and drained by Dr Kopetzky, following which a transfusion of 150 c c. was given The infection subsided and the hemoglobin remained stationary until March 16 when there was another fall to seventy per cent and the signs of meningitis reappeared At this time an apicotomy was performed by Dr Kopetzky Repeated small transfusions were then given and the hemoglobin reached a plateau of seventy-five to eighty per cent. Convalescence was uneventful until April 14 when there was another marked fall in the hemoglobin with recurrence of the signs of meningitis The petrous tip was re-exposed by Dr Kopetzky Following this, small transfusions were given every other day for two weeks This was accompanied by a gradual and continuous rise in the hemoglobin until one hundred per cent was reached. All signs of the infection had subsided and the patient was discharged.

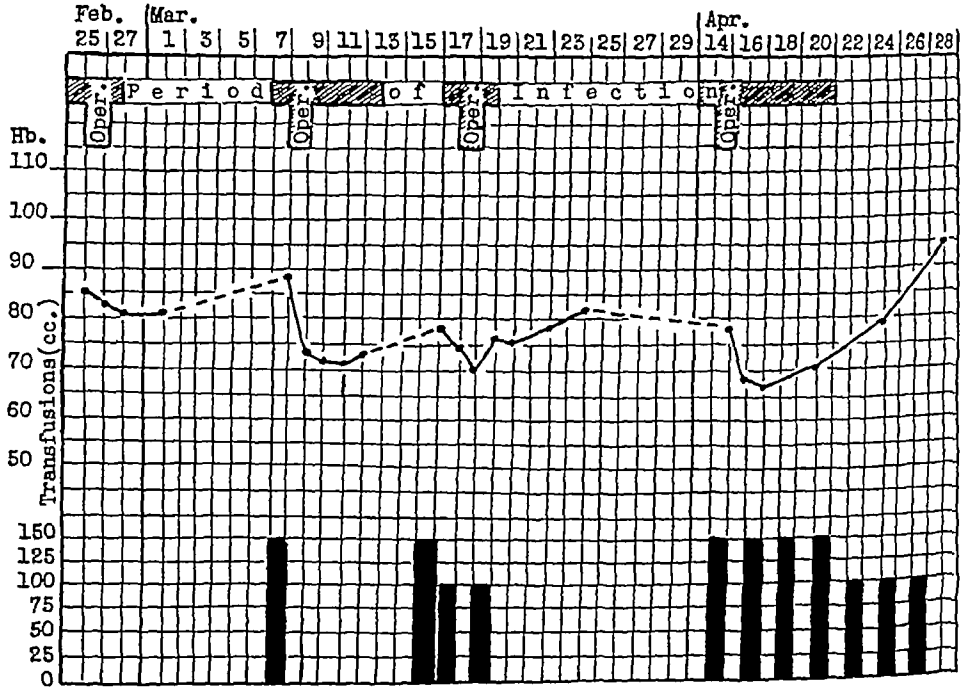
This case shows clearly that with the continuance of the infection there is a progressive fall in the hemoglobin This fall can be successfully combated by repeated transfusions to maintain the hemoglobin at a fairly normal level Furthermore this case denoted that the end of the infection is characterized by a marked and continuous rise in the hemoglobin which is self-sustaining There seems to be no bone-marrow depression in evidence even though this patient received a total of 1000 c c of blood over a period of two weeks

CASE 2 B K (Chart II), an eight year old female admitted with a history of mastoiditis to the service of Dr Kopetzky, during this period of infection the hemo-

From the Service of Dr S J Kopetzky, Department of Otolaryngology, Beth Israel Hospital

globin fell from ninety to eighty per cent Mastoidectomy was performed and convalescence appeared normal except for the fact that the patient ran a continuous sustaining temperature During this period the hemoglobin fell further to seventy per cent. A spinal tap was performed and revealed 5000 cells There was no evidence of

CHART I



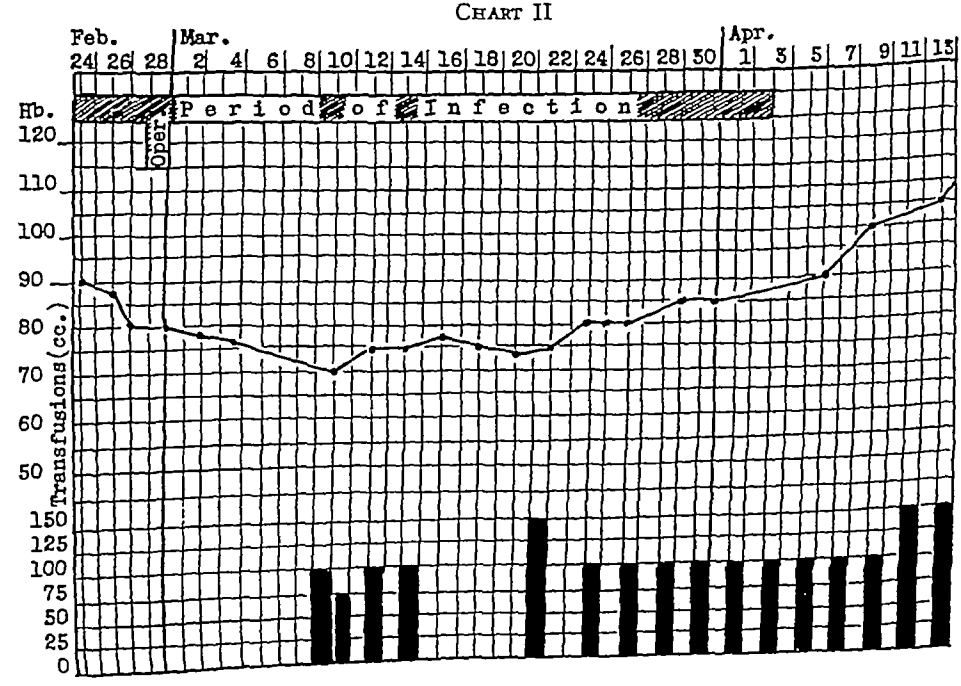


CHART II

meningeal disease until one week later when a right hemiplegia was noted. A ventriculogram revealed a normal ventricular system A diagnosis of meningoencephalitis was made. The patient was acutely ill, running a persistent fever, vomiting continuously, and taking only small amounts of liquid nourishment for practically an entire month However, by means of repeated small transfusions (100 to 150 c.c. every other day), the patient's nutrition was maintained. There was no further fall in the hemoglobin, in fact during this time there was a slight but progressive rise The spinal tap revealed fewer cells at each examination As the cell count became normal, there was again noted a sudden and continued rise in the hemoglobin which reached a maximum of 120 per cent when transfusions were stopped

This case also shows the progressive fall in the hemoglobin associated with the infection Repeated small transfusions were again performed and these maintained the patient's hemoglobin and nutrition at a fairly normal rate The end of the infection was marked by the sudden rise in the hemoglobin that gave evidence of hematopoetic stimulation

Conclusions

These two cases illustrate the following

1 The hemoglobin falls with the onset of the infection

2 The fall is continuous and progressive

3 The fall persists until the end of the infection

4 The end of the infection is marked by a noted return of the hemoglobin to normal

5 The hemoglobin can be maintained at a normal figure during active infection by repeated small transfusions

6 The return of the hemoglobin to normal seems to be stimulated rather than depressed by the small repeated transfusions

FOURTH INTERNATIONAL LEPROSY CONFERENCE

In January, 1931, there met in the city of Manila, P I, under the auspices of the Leonard Wood Memorial, a group of scientists engaged in leprosy work, representing most of the countries where leprosy is a serious health problem One of the principal results of this conference was the organization of the International Leprosy Association

The next world conference of leprosy workers is to be held at Cairo, Egypt, March 21 to 31, under the auspices of the International Leprosy Association. The Egyptian government is giving generous cooperation and is issuing official invitations to other nations to send representatives It is expected that approximately five hundred leading scientists from throughout the world will attend. A report of what each has been accomplishing in his own particular sphere will be made Closer cooperation between these scientists, who are giving their lives to this work, will be made possible

Egypt has known leprosy for some six thousand years and is now conducting an active anti-leprosy campaign Because of her central position between the east and the west, she is strategically located for such a conference.

The inaugural ceremony will take place in the Royal Opera, Cairo The other meetings will be held in the amphitheaters of the Faculty of Medicine The United States will be represented by the following delegation Dr H E Hasseltine, U S Marine Hospital, Carville, La, Chairman, Dr Victor G Heiser, President, International Leprosy Association, Mr Perry Burgess, President, Leonard Wood Memorial, Dr H W Wade, Medical Director, Leonard Wood Memorial Dr Jose Rodriguez, Philippine Health Service, Dr J A Doull, Western Reserve University, Dr George M Saunders, Director Epidemiological Department, Leonard Wood Memorial, Mr Emory Ross, General Secretary, American Mission to Lepers

They will sail from New York on the S S "Exeter" on March 1

The Leonard Wood Memorial believes so firmly in the benefits of these general meetings that it is making a liberal appropriation toward the expense of the forthcoming conference.

Dr Leon Binet, of Vichy, France, addressed the Clinical Society of Beth Moses Hospital, Hart St. and Stuyvesant Ave., Brooklyn, February 10, in the auditorium of the dispensary building on "Liver Insufficiency"

globin fell from ninety to eighty per cent. Mastoidectomy was performed and convalescence appeared normal except for the fact that the patient ran a continuous sustaining temperature. During this period the hemoglobin fell further to seventy per cent. A spinal tap was performed and revealed 5000 cells There was no evidence of

is content to accept them as the sole cause of symptoms

This occurs so frequently that in our practice one-third of all cases of carcinoma of the lower bowel have received some form of treatment for hemorrhoids during the time in which the neoplasm must have been present—a fact substantiated by other operators In one of our cases, bleeding from an "innocent" polyp prompted an examination The patient had been under treatment for a duodenal ulcer for some time, and was referred to us because of passing blood per rectum Examination revealed a pedunculated polyp, and above it a carcinoma

Many cases of carcinoma have been able to demonstrate the presence of diverticulitis One case of fistula in ano was referred to us, which upon examination was disclosed to be a fistulous tract arising in a cancer of the rectum This patient had already been submitted to operations for the cure of the fistula, and yet the malignant growth had not been discovered Incidentally, this patient lived for fifteen years following operation to die of pneumonia

Recently a surgeon removed a carcinoma of the rectum, sublimely ignorant of the fact that there was another malignant growth a few centimeters higher, as was demonstrated at autopsy On the other hand, symptoms arising from a carcinoma may simulate other diseases

Thus a cancer of the anterior wall of the rectum may easily be mistaken for prostatic disease In our own practice we have seen several cases where prostatectomy had been performed although the true lesion was a carcinoma of the anterior wall of the rectum In like manner, reflex symptoms from disturbances of the sympathetic system may lead to an erroneous diagnosis of peptic ulcer, or gallbladder disease etc We base this statement on the fact that symptoms have, in some of our cases so diagnosed by the referring physician, disappeared when the malignant growth in the lower bowel had been removed It must be realized also that no patient is necessarily limited to one disease at one time The profession must become more generally cancer minded in this as in other parts of the body And both practitioner and clinician must consider rectal pathology as potentially carcinomatous until otherwise definitely proved

Let us now consider the various stages of malignancy which will be encountered in the rectum and rectosigmoid The earliest stage to be recognized is that of an adenoma no larger than a pinhead These are frequently miscalled polyps, and often considered unworthy of treatment As a matter of fact, in our experience forty per cent of all these adenomata are malignant on section, and many more are borderline tumors, and there can be no doubt that all of them are potentially carcinomatous Some experts go so far as to consider all adenomata as precancerous These small lesions may be divided, according to their physical characteristics, into sessile and polypoid types Both of these groups are easily destroyed locally The polypoid type never recur nor give rise to metastases if thoroughly extirpated, no matter what means are employed

The sessile type occasionally recur, but when this happens it is because they have not been completely removed The prime reason for this failure is the surgeon's fear of penetrating to the peritoneal cavity Cases have been reported in which distant metastases followed excision of this type of growth, but they are so rare as to constitute museum pieces

The next stage is a button-like projection without ulceration, exactly like a mushroom without a stem In those cases the growth has not reached the submucosa and shut off the circulation, causing ulcerations

A further stage of malignancy encountered is the fully developed adenocarcinoma This may be of the cauliflower, the ulcerating, or the infiltrating type.

Cuthbert Dukes has graded these tumors for prognostic purposes His type A is that in which the growth is confined entirely to the bowel The B type consists of those in which there is invasion of the perirectal tissues The C type is comprised of those in which the lymphatic glands are involved This method of classification is not intended to be used upon biopsy specimens, but applies to the section of the completely removed specimen He subdivides his C cases further into (1) those in which there is no involvement of the lymphatic glands above the pedicle

CANCER OF THE RECTUM AND RECTOSIGMOID

JEROME M LYNCH, M D, F A C S, *New York City*

Carcinoma ranks second only to heart disease as a cause of death today, and were it not for surgery would usurp pride of place Fortunately, the majority of neoplasms are found in the breast, the lower bowel, and the mouth, in other words, where they are susceptible to observation and palpation and therefore more readily recognized

Most people are aware of the great strides which have been made in the treatment of cancer of the breast The entire profession is now alive to the frequency of this malady, its ease of diagnosis, and the comparative certainty of a cure in its early stages It has come to the point where many of these cases are discovered in the course of routine examinations, before the patient is sensible of the presence of pathology

Similar progress has been made in early diagnosis of cancer of the mouth, although treatment of these cases has not been so successful The time seems ripe for a like advance in cancer of the rectum and rectosigmoid The first step must be the inclusion of rectal examination as routine

No clinician would dream of considering a general examination complete which did not include full inspection of the mouth, the same principle should apply to the rectum It is frequently claimed that investigations are not carried out in this region because the patient objects This is far from true Patients do not often object to a thorough overhaul at the hands of the experienced, whatever that involves in fact they frequently ask for one The clinician is more often the one to avoid doing a rectal examination, primarily because it is erroneously considered needless, secondarily because he doubts his qualifications to perform the examination

However, when it is realized that 35,000 Americans die yearly from cancer of the bowel, that cancer of the lower bowel comprises nearly one-half of all neoplasms, fully forty per cent of them being within reach of the examining finger, a different light is thrown on the subject. An exact diagnosis may be impossible in all cases, but the presence of pathology cannot escape the veriest tyro, and should lead to the summoning of an expert

Electrically lighted instruments afford a better view of the lower bowel than was possible even a few years back. The most minute adenoma, or "polyp," should be visible to the trained observer today

From the earliest era of proctology, the plea has been for early diagnosis of cancer, for early recognition of the true lesion spells cure, and neglect often means that nothing but palliative measures remain Despite all propaganda, however, the interval between onset of the disease and the presentation of the patient for treatment has not decreased Most carcinomata of the lower bowel are seen sometime between nine and thirteen months after their commencement The reason for this is two-fold Lack of knowledge of the true early symptoms, and misleading associated pathology Carcinomata of the rectum and sigmoid give rise to very slight early symptoms They may amount to nothing more than constipation in the previously normal, or to increased constipation in one already afflicted The comparative silence of the early lesion may cause the patient to absent himself from examination until the growth is well-advanced The clinician, too, may overlook the true import of symptoms, confused by textbooks which give the signs and symptoms of late carcinoma (i e, wasting and diarrhea) under the heading of early cancer The true diagnosis may therefore not be suspected, since "What the mind does not ponder, the eye cannot see."

The second great cause of faulty or late diagnosis is the presence of additional pathology Frequently the examiner, having discovered such conditions as hemorrhoids, benign adenomata or diverticulae,

Read at the Annual Meeting of the Medical Society of the State of New York Rochester, May 26, 1937

certainty, and therefore one is justified in employing any procedure which holds out hope of cure, or even of prolonging life with comfort In the absence of surgery the patient faces death due to intestinal obstruction and preceded by cachexia and possibly by great pain due to metastases in the spine Surgery offers either an immediate, painless death, or on the other hand a resumption of normal, useful life If the operation is entirely successful, the patient will live to die of some other disease If it is only partially satisfactory the worst that the patient has to fear is "liver death," rapid at the end and comparatively painless

There are certain set questions which are asked by the family physician and the patient after a diagnosis of cancer has been made and the treatment outlined One is, "Doctor, do you think the patient can stand the operation?" I usually reply by saying, "Well, if you fell overboard and someone threw you an oar, would you seize it, or would you say to yourself, 'I don't believe I could hang on until saved, so I will spare myself all effort and drown at once?'"

I have never been able to fathom the psychology of those who are unwilling to take a chance in a desperate situation Here is a case in point

Mr S underwent a cholecystectomy At operation it was discovered that he had a large carcinoma of the cecum with almost complete obstruction The operator, having discovered the trouble and fearing the man would die on the operating table, closed him up and declared him inoperable. In the patient's own words, all the leading diagnosticians of his acquaintance had advised against further interference on the grounds that this might cut short his life, even though at best he could not live very long As a matter of fact, my own staff (which did not then include Dr Hamilton) strongly advised letting nature take its course. I personally have been less interested in statistics than in saving lives I decided to fill him with fluids, operate, and hope for the best. I removed one-half of his colon and ten centimeters of the ileum, and left him with an ileostomy He made a complete recovery, and lived with his ileostomy for six years, passing formed stools In the meantime he married, and the bride decided that a change in the plumbing was in order Accordingly I did an ileocolostomy, and he now declares that he can remember no time in his life when he has been so comfortable and happy It is now eight years since he was given up as inoperable

A further case in point was a young woman from a neighboring town who for over a year had consulted many doctors, usually telling them that she was convinced that she had a tumor of the bowel. Having failed to convince those in her neighborhood, she proceeded to a Mid-Western clinic (not the Mayo Clinic), where a diagnosis of inoperable carcinoma was made. That was nine years ago I operated upon her, doing a combined abdominoperineal operation with a perineal stoma, and she has not missed a day's work since her convalescence

There is a firm conviction buried deep in the medical mind that a recurring tumor spells death, and that surgical interference is contraindicated

I operated upon Mrs G in 1926, doing a combined abdominoperineal operation with a perineal stoma I excised twenty-five centimeters of the lower bowel, including the anus The growth (Broder's Grade II) was found to begin four centimeters above the anal verge, and to extend five centimeters There was also a chronic inflammation of the lymph nodes Two years later there was a recurrence of the disease. It consisted of two separate growths, both of which were Grade III, more malignant than the primary lesion I must say that it was with some misgiving that I undertook to operate a second time. Seven years have now elapsed since that second operation, and the family tells me she is the most cheerful person in the neighborhood, and one of the most active.

Conclusions

1 Patients with carcinoma of the lower bowel have not entered upon a one-way street

2 Early diagnosis can only follow the establishment of biannual routine sigmoidoscopies

3 A one-stage operation is preferable whenever possible

4 A perineal stoma is the most satisfactory

5 The mottos of the surgeon dealing with carcinoma should be "Put Yourself In His Place" and "Nil Desperandum"

205 E. 61 St

(See page 272 for Discussion of Dr Lynch's paper)

of the vessels, (2) those in which the glands above the pedicle are involved

By combining this method of classification with that advocated by Broder, a reasonable estimate of the life expectancy may be obtained, and will be found to err on the dark side, if at all Percentages of five-year cures which may be expected in these groups are as follows

A—93 per cent
B—65 per cent
C—23 per cent

Statistics pertaining to the surgical cure of patients afflicted with carcinoma of the lower bowel, in referring to adenocarcinomata, describe they as "early lesions" Actually, they are late manifestations, the disease having been present for from nine to thirteen months Carcinomata of this type, of course, require more than local removal A suitable operation must be performed which will remove not only the gross lesion, but all pathological tissue as well The surgeon performing such an operation must not be limited in his methods He must be prepared to alter his technic to fit the individual case No technic can be devised which will prove satisfactory for all patients and all growths The operator must be a thoroughly trained surgeon, able to change his methods to meet any emergency or demand encountered at operation

With these restrictions in mind, we suggest a few broad principles of procedure

1 Surgical excision is the only method at present which gives a reasonable expectation of eradication. These tumors are practically all radioresistant, and the amount of radiation necessary to destroy the growth would be more than sufficient to cause the death of the patient. We fully realize that lesser amounts may retard the growth, but we feel that any local benefits to be derived therefrom are more than offset by the general malaise, anemia, and possible local complications so developed

2 A one-stage operation is preferable except in the presence of marked intestinal obstruction.

3 Simple perineal excision of the rectum is preferable whenever possible Increasing experience permits many more cases to be operated upon in this manner, since by practice one is able to remove more and more bowel from below

4 If a combined operation is necessary, we always prefer to leave the patient with a perineal stoma In certain cases one is able to preserve the sphincters ani by anastomozing the bowel through the perineal wound

Coming to the fourth stage of carcinoma seen in the lower bowel, we find the so-called "inoperable" type This word "inoperable" is used in the most lax and careless manner, referring not only to conditions which actually are inoperable but to those which are inoperable only in the eyes of the untrained

It is in the first and last of these stages that we may expect great progress There is no reason for the small adenomata to be allowed to develop into huge adenocarcinomas, we hope to show the benefits to be derived from refusing to label *any* case inoperable except as a last resort It is in reality impossible for any surgeon to state definitely whether or not a case is inoperable until he has attempted to operate.

There are many reasons for optimism in these late cases First, there is the nature of the tumor to be considered Most carcinomata of the lower bowel are Broder's Grade II—i e, they are not excessively malignant They tend to project into the lumen of the bowel, rather than to invade the muscular coats They are slow-growing tumors They do not metastasize early

The results of experience are likewise in our favor Surgeons who operate on many of these lesions are becoming more willing to submit these late cases to surgery because they have found that many which were considered hopeless have lived years of useful postoperative life

A growing number of us no longer consider metastases in the liver a contraindication to suitable surgery Some of us have operated upon cases in which we have been compelled to leave behind some of the actual primary growth, and yet have seen those patients recover and resume their normal lives

Although this happy result cannot be expected in all cases, still one must remove as much of the tumor as possible, just as the breast surgeon does in the case of an inoperable growth, to insure against the painful ulcerations common to large fungating masses

A further reason for surgery in these late cases is that without it death is a

condition of the patient, and the judgment and experience of the surgeon. On my own service, in abdominoperineal resections, we have had the best results with the procedure described by Lahey of Boston In our own experience the advantages have far outweighed its shortcomings

In view of the fact that early indications of carcinoma of the sigmoid and rectum are uncertain we must continue to advocate thorough periodic physical examinations This course is one, I feel certain, which will meet with the approval of every man in this room but which in all probability has seldom or never been applied to the case of himself.

SURGICAL MOVING PICTURES IN COLOR

The Problem of Lighting

BOARDMAN M BOSWORTH, M D, *New York City*

The most important problem in taking surgical moving pictures in color is adequate illumination The lights must be intense and yet not give off much heat, they must be small, light, compact and not interfere with the surgeon or his assistants They must be readily adjustable to superimpose their light upon an object close at hand and yet not impinge upon the field of any lenses used They must be automatic, so that once they are set up, the photographer can completely forget them while he is taking pictures This means not only that they must move with the camera wherever it is pointed or placed, but that they automatically snap on and off as the camera starts and stops

The homemade bracket (Fig 1) fits the above requirements to an exacting degree It can be duplicated or modified to suit particular needs very easily and at small cost The bracket was made from sheet metal by a mechanic after a pasteboard model It provides two slotted channels into which the flat reflector posts are slid and fastened with thumb screws The bracket is held solidly to the base of the camera by four small screws

The reflectors were an inexpensive variety with rough aluminum finish They had place for only two No 1 photo-flood bulbs each, when purchased, but were modified as shown to hold three such bulbs and then were chrome plated for greater reflection Since they are shallow, they do not extend into the lens field, yet they can be turned toward each other to superimpose light on a nearby subject This allows the use of smaller stops for clearer definition and greater depth of focus

Each reflector is an individual unit and may be set on its own collapsible tripod if it is desired to use them separately from the camera When mounted in the bracket (Fig 2), they plug into a three-way socket from which a single wire leads to the wall outlet In this particular set-up the electric motor drive connects with the same line so that lights and camera are controlled by a single switch (Fig 3) Furthermore, since the lights are supported on the camera base, they turn as the camera is pointed and the field is always illuminated

During the past year many thousands of feet of sixteen mm Type A Kodachrome film have been taken with the out-

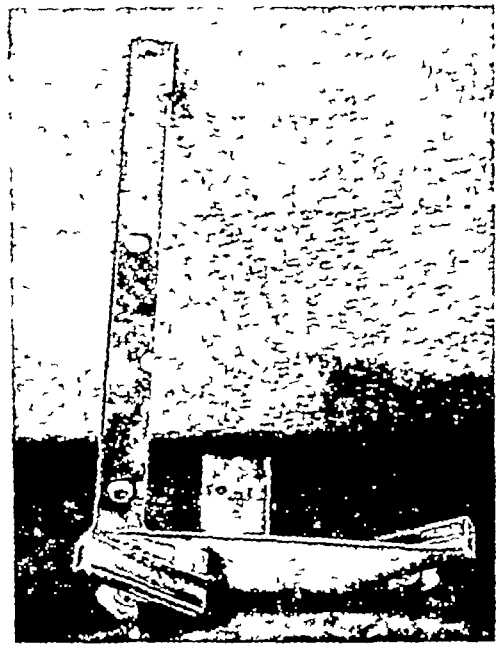

Fig 1 Light bracket

Discussion

DR. GEORGE JOHNSON HAMILTON, *New York City*—I should like to take this opportunity to say a few words about matters which our discussors introduced *First* the colostomy bag, in my training at St. Bartholomew, St. Marks and later in our practice here (Polyclinic Hospital, New York City) I have never seen one It is true that we have one patient who uses one, but only in this manner He takes an irrigation the first thing in the morning, straps the colostomy bag on, proceeds to shave and shower, by which time the bag has been filled and is discarded until the next morning

Second I would suggest that difficulty in obtaining control of the perineal stoma may be due to the formation of excess scar tissue at the mucocutaneous junction It may be necessary to excise this once or twice in the office

Third The education of the laity as to the prognosis in carcinoma of the lower bowel has been mentioned. I would suggest that skilled surgeons in other specialties also need enlightenment. A short while ago, a very eminent gynecologist acknowledged that he had thought that all cases of carcinoma of the lower bowel died regardless of treatment.

Fourth We all appear agreed that biannual examinations are necessary I would like to stress the point that there is no carcinoma age Seven per cent of cases are under thirty-five years of age. We are cooperating with the patient and family physician both, when the time for their next examination arrives, and find this method very satisfactory

DR. ALBERT G SWIFT, *Syracuse*—After listening to the excellent paper by Dr Lynch, one would wish that it could have been heard and pondered by every practising physician in the country and every layman over the age of forty years

As has been pointed out, the operative mortality rate has decreased markedly in the past ten years and the percentage of five-year cures has increased The records of all large clinics show conclusively, however, that there has been no appreciable shortening of the interval between the onset of symptoms and the commencement of surgical treatment.

While it may be true that surgical management is approaching the peak of its efficiency, it is certain that too many patients are coming to surgery many months later than they should. Any further advance, therefore, must be along the line of cancer research on the one hand and earlier diagnosis on the other

While several well-endowed foundations are engaged in cancer research, it may very logically be considered a public health charge It is interesting to note that the amount allotted annually by the national government for this work has increased from $34,000 in 1930 to $100,000 in 1936. In the latter year, in contrast, the government spent $846,500 on cotton research, $507,000 for utilization of forest products, and $387,000 for "dairy cattle" research

The solution of the problem of earlier diagnosis and treatment is here, as elsewhere, a matter of teamwork between the potential patient, the physician, and the surgeon Much valuable information has been given to the public already in the form of radio broadcasts, addresses to clubs, and by such excellent articles as recently appeared in *Fortune*, now available in booklet form. In time, fear should not be the predominating emotion, and cancer should be discussed as freely as are tuberculosis and syphilis at present.

Women are becoming well-informed about cancer of the breast and cervix. We were told yesterday of one woman who reported to a large clinic and had diagnosed a cancer of her breast before her physician had done so

Information regarding malignancy of the sigmoid and rectum is much more difficult to impart as the early signs and symptoms may be indefinite. Warning should be given that pain is not the important symptom while irregularity of bowel habit is, that rectal bleeding may very easily be from a lesion much more serious than hemorrhoids, and that even at most a colostomy can be controlled by careful attention to diet, irrigations, and a flat pad, rather than an objectionable pouch

The education of the medical man may be a little more difficult. Too many physicians and some surgeons still consider cancer as a hopeless proposition, and a permanent colostomy as an abomination to the patient and to everyone with whom he comes in contact. It is not too much to ask that every physical examination shall include a digital palpation of the rectum, and a bimanual examination of the lower abdomen. Moreover, every patient with any symptoms referable to sigmoid or rectum should have a competent proctoscopic examination before the diagnosis of simple hemorrhoids is made.

The operative procedure must depend upon the location of the lesion, the general

condition of the patient, and the judgment and experience of the surgeon. On my own service, in abdominoperineal resections, we have had the best results with the procedure described by Lahey of Boston In our own experience the advantages have far outweighed its shortcomings

In view of the fact that early indications of carcinoma of the sigmoid and rectum are uncertain we must continue to advocate thorough periodic physical examinations This course is one, I feel certain, which will meet with the approval of every man in this room but which in all probability has seldom or never been applied to the case of himself.

In time, fear should not be the predominating emotion, and cancer should be discussed as freely as are tuberculosis and syphilis at present.

Women are becoming well-informed about cancer of the breast and cervix. We were told yesterday of one woman who reported to a large clinic and had diagnosed a cancer of her breast before her physician had done so

Information regarding malignancy of the sigmoid and rectum is much more difficult to impart as the early signs and symptoms may be indefinite Warning should be given that pain is not the important symptom while irregularity of bowel habit is, that rectal bleeding may very easily be from a lesion much more serious than hemorrhoids, and that even at most a colostomy can be controlled by careful attention to diet, irrigations, and a flat pad, rather than an objectionable pouch

The education of the medical man may be a little more difficult. Too many physicians and some surgeons still consider cancer as a hopeless proposition, and a permanent colostomy as an abomination to the patient and to everyone with whom he comes in contact. It is not too much to ask that every physical examination shall include a digital palpation of the rectum, and a bimanual examination of the lower abdomen Moreover, every patient with any symptoms referable to sigmoid or rectum should have a competent proctoscopic examination before the diagnosis of simple hemorrhoids is made.

The operative procedure must depend upon the location of the lesion, the general

PUBLIC HEALTH ASPECTS OF MENTAL HYGIENE

FREDERICK W PARSONS, M D, *Albany*
Commissioner, New York State Department of Mental Hygiene

Public health—the health of human beings in groups or communities—is a matter of general and deep concern To the promotion of better health all physicians devote themselves and that the individual effort shall be more effective when more widely applied, we have created groups whose main interest is the promotion of community health Some of these groups have governmental support, a notable example being the U S Public Health Service Others are creatures of State—the State Boards of Health In addition there are county and city boards of health, other smaller groups establish their own guardians of the public health To further promote the cause of better health there are voluntary associations of individuals, medical and lay, and hosts of special societies having a deep interest in some particular aspect of public health The subject is therefore quite completely covered

We think of public health as the particular function of a group of professionals to whom the people look to protect them from epidemics, and we are so accustomed to think of public health in terms of communicable diseases that we fail to think of its larger significance

Public health physicians are primarily practitioners of preventive medicine They guard our water supply and the quality of our food and our housing, and with broad general efficacious sweeps promote better health They concern themselves with birth and death rates, morbidity figures, density of population, hazards of employment, the food supply, or any other phase of life which has an interest in or an effect on the well-being of the population Without their help the world would be less well off Their interest even extends to the particular patient and we find them locating individuals and dealing with a specific case as painstakingly as does the private practitioner We contemplate with satisfaction what the official custodians of community health have done with cholera, bubonic plague, typhus, and smallpox The results with typhoid and diphtheria are still fresh in our minds, and we confidently expect similar results with other disorders.

The subject of this contribution links mental hygiene with public health and we ask ourselves what the sanitarians can do in the field of our particular interest To state the situation in another way is to inquire if the broad general principals which have so splendidly advanced physical well-being can be used to promote mental health It perhaps will be to our advantage if the scope of these observations is limited to mental diseases and as that field is large the domain might be still further circumscribed to only some of the types of psychoses Rather than casually examine all forms, it may be wiser to limit the inquiry

Does the incidence of mental disorders warrant the attention of public health authorities? Is it of sufficient significance? To those questions the answer is in the affirmative A type of illness of which nearly half a million persons are known to be attacked in sufficient intensity to warrant hospital care merits public concern Nearly sixty per cent of all the hospital beds in the U S are occupied by mental patients and one hundred and twenty-five thousand new cases develop annually The care of that large group costs the people of this country 271 million dollars a year and statisticians compute the annual economic loss to be slightly more than a billion dollars a year

Once these were staggering figures but they provoke thoughts as to whether or not the mental health of the community is getting better or worse There is no positive answer to that inquiry We know that the ratio of sane and insane is increasing Pollock and Malzberg, using U S census figures, report that in the year 1880 there were 81 6 persons in mental hospitals per 100,000 population In 1890 the num-

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

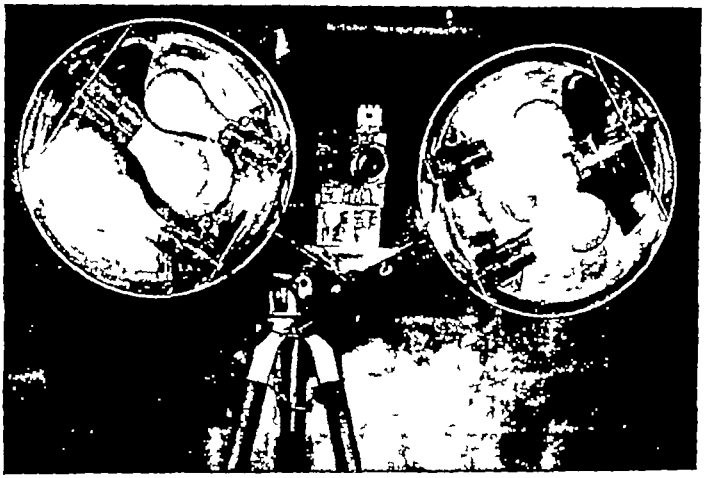

Fig 2 Light reflectors mounted in bracket on camera base

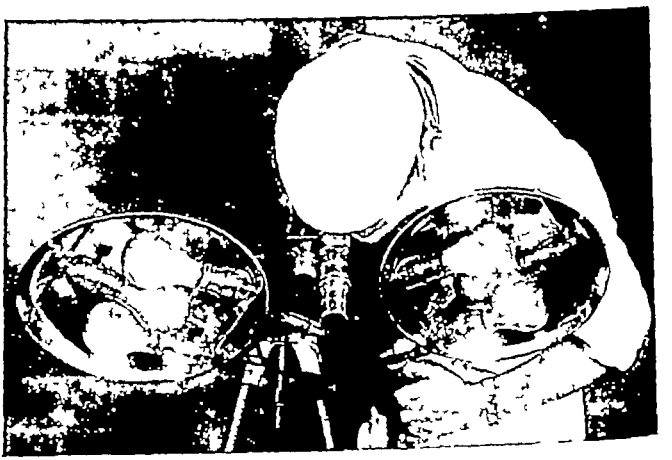

Fig 3 Single switch control of lights and camera

fit illustrated, with uniformly excellent results Most pictures were filmed at a distance of three feet with 1 inch F-1 9, 2½ inch F-2 7, and 4 inch F-2 7 lenses Such "fast" lenses are not at all necessary with this lighting arrangement at three feet from the subject, as the stops used varied from F-8 to F-3 5, depending upon how much of the field was covered with drapes, blood or iodine However, only slightly greater distances require considerably larger stops and for this reason "fast" lenses will be found very useful

For half or full figure pictures (e g to show postoperative function) it is best to set the reflectors in their own tripods at four or five feet from the subject, so that the camera can be moved back ten or twelve feet In this case if a third three-light reflector be added, the same lens stops may be used as at three feet

Three such reflectors with three extra collapsible tripods, extra bulbs, extension wires, etc. fit easily into a small handbag and weigh less than fifteen pounds

The lighting outfit shown, including two reflectors and light bracket, was assembled at a total cost of $15 50

58 E. 65 St

Lieut.-Gov Keen Johnson told a story in a speech before the Kentucky State Medical Association about a doctor friend who treated a fellow for lumbago He had treated him for quite some while and he thought rather successfully He sent him a bill and the fellow sent him a check and he sent the check to the bank and it came back marked "No funds"

He met the fellow on the street and he said to him, "That check you gave me came back."

"Doc, that's funny," he said, "so did that lumbago"

of the involutional period, and dementia precox With those we do not as yet know how to deal effectively There must be some means to understand those groups, and to that better understanding psychiatrists must devote themselves It will come We may have to wait for the physicist to give new methods of study and when we do understand those disorders better it may be that we shall not know how to use the knowledge thus gained The greatest opportunity will be ours when we sufficiently understand mental departures that workable rules of mental health can be set down in simple language No one now knows what course of action is conducive to mental health and when face to face with a case of dementia precox in the early stages, in most instances, the psychiatrist brings to the patient but little real assistance When we can give to our patients helpful directions as simple and as easily understood as the pediatrician directs an infant's food or as beneficial to the tubercular patient as the directions of the internist, then the psychiatrist will be of distinct service to his patients

The idealists, searching for a short-cut to perfection, will not be content to deal piecemeal with the troublesome problem of mental disorders They will want to attack mental diseases en masse One will say that in a social setting, constructed after a certain formula, human wants will be realized and that when strivings are satisfied and conflicts abolished national mental poise will be maintained This was seriously advocated by certain American psychiatrists returning from countries where social experiments had travelled far, and they cited as proof the empty asylums of eastern Europe If during the years of food shortage, nourishment was denied to the inarticulate and starvation removed the patients, that was not advertised Certain knowledge of foreign conditions is not easily obtained and reports, neither of the protagonist nor the antagonist can be accepted uncritically

Another enthusiast will advocate eugenic reforms On this proposal something might be said if one were wise enough Everyone has seen individuals of whom it can truthfully be stated that the world would have been no poorer had they never been born There are not many physicians endowed with sufficient authority and with enough knowledge who, before the fact, can speak with equal assurance Perhaps in a system of government where autocratic powers in that direction were granted, we would say that which we now have is cheap at a billion a year Still other optimists will say that mental disorders of the types so numerous, so troublesome, and of which we know so little, originate because of a glandular or dietetic deficiency, and none should be so bold as to say that what they advocate will not some day be found to be of greatest importance The position of psychiatrists is so desperate that no suggestion should be rejected until thoroughly explored

When will psychiatrists be able to do more for their patients? The time will be here when we know as much of our subject as do internists, who can, by the evidences of their five senses, understand the disease process That we cannot now do The internist deals with tangibles, psychiatrists deal mainly with intangibles That makes our problem more difficult What an entirely different group would do with the present problem of the psychiatrists raises an interesting speculation Would a group of scientists, untrained in medicine, bring a new point of view or would those physicians in the public health field who have solved, or are on the way to solve, the physical diseases, repeat their successes in the mental field? They are the exponents of preventive medicines What we in the mental sphere need is prevention and may we soon see in our principal medical interest a reflection of the success of the doctors of public health!

STATE OFFICE BLDG

The Tenth International Medical Congress for Psychotherapy will be held in England at Balliol College, Oxford, on July 29 to August 2, by the invitation of a number of British Societies

Jags "Doctor, my wife has insomnia very badly She very often remains awake until 2 o'clock in the morning What shall I do for her?"

Doctor "Get home earlier"

ber had grown to 118, in 1904 to 183, in 1910 to 204, in 1923 to 245, and the latest figures indicate that for every 100,000 in the U S there are now 308 persons in mental hospitals For this growth there are many reasons and it is altogether likely that the ratio of those mentally sick to those in good mental health is no greater now than it was in 1880 More of the sick are now in hospitals where they can be counted than was the case in 1880 and there is no good reason to believe that the mental health of the community is worse today than it was when a count was first undertaken One should never lose sight of the fact that those communities which do most for the sick have the greatest number to care for Certain rich states in the East have a high ratio and those poorer states which maintain almshouse standards have the fewest No one argues that almshouses contribute to mental health but good mental hospitals have the confidence of the community and attract and keep their patients During the two generations which have shown the striking increase in the number of insane to the total population, psychiatry has developed from a medical interest of limited consequence to one of the first magnitude Our entire psychiatric thought has changed Notable progress has been made, but psychiatrists have devoted themselves more to trying to understand the problem than to the application of remedies, and in the efforts to understand they have made some progress That attitude has been logical for how can one expect to apply preventive methods until there is some understanding of the nature of the problem So long as physicians were satisfied to make a diagnosis of fever for any case having elevation of temperature, the practice of medicine advanced but little and physicians can expect to be held back while satisfied to separate people into two groups—sane and insane

I would not have you think that psychiatrists have not classified the mental disorders They have, and the public health approach, which after all will be along lines of prevention, will take into consideration what can be done with each broad group

Some will be easy The absolute control of syphilis comes first to mind That will eliminate general paresis and reduce the incidence of mental disorders about ten per cent It probably will reduce the arteriosclerotic types and there will be other benefits For example no one knows how much mental enfeeblement is directly traceable to syphilitic infections It is reasonable to expect that a syphilitic parent may have a feeble-minded child.

We can see the day when acute infections of the central nervous system will be under better control and the encephalitic cases and the polio victims fewer than at present With the recent unhappy outcome of the efforts to control alcohol still before us, only the confirmed optimist will believe the number of cases due to overindulgence in drink will be substantially reduced but the alcoholics may be brought under better control by temperance drives It is worth striving for Overindulgence in alcohol accounts for about eight and one half per cent of the first admissions to New York State hospitals and that probably is a fair example of the nationwide experience Intemperance of one who does not have a psychosis adds to the stresses of others, so what the reports indicate to be the percentage of alcoholic admissions do not tell the whole story The limitations of the abuse of drugs and other exogenous poisons, although of slight importance, should not be insuperable obstacles The traumatic psychoses are not numerous and it will be difficult to protect people from injury Perhaps we may learn to manage head injuries better and thereby avoid some of the later consequences.

Much mental failure comes with the declining years Those forms of mental illness are rapidly increasing and the reasons are those which account for the rise in the cardiac cases, the cancers, and the other diseases of advanced age The youth whom the public health officials save from typhoid and tuberculosis lives to die of one of the diseases of the aged.

Something can be done in all these fields Instances of opportunities are there The remedy is known, the wholesale application may be difficult, but the situation is not without hope

Much more formidable, of infinitely greater importance, and so far as we can now see, of insurmountable difficulties, is the great residual group of the manic depressive cases, the agitated depressions

physical and mental health and welfare of the people at large. Not only should we be interested but we should, in large numbers (a great majority) show our fitness for leadership in these affairs in so far as we can contribute to better results than the devoted lay interests can alone accomplish We should be so led as to demonstrate to the people Fred Elliott's notable truism "Every community has a vital stake and resource in the prosperity of its physicians" They should not have to worry about food, clothing, home and fuel for their families They should have means with which to enlarge their abilities to serve the community Cooperation with the Health Departments is an outstanding duty of medical leadership As we have travelled about the State we have been impressed with this cooperation where the local health officer or the commissioner and deputies have been integrated in the membership and activities of the County Society The Health Commissioner of the State is as enthusiastic about this as we are

Our leaders should guide us into greater interest in citizenship! When Fred Sondern was our State President he told us of one district in New York City where there were four hundred and fifty-six physician voters of whom sixty-seven voted in an important State and National election We suppose this could *not* happen here It should not happen anywhere in our beloved Country Moreover we have intellectual power to influence votes and we should exercise it.

Every County Society has its peculiar and particular problems to solve in its special type of community The same *general problems* are common to all—but variations from utmost simplicity to complex elaborations occur in their characters and in their solutions *Your* public Health Committee activities are well-known throughout the State. Through Dr Edward Wentworth we learned of the masterly handling of the Dispensary situation four years ago, and more recently of the Hospital service cooperative regulations—perhaps the most judiciously managed of any in the State. In these affairs and many others you have here demonstrated superb and sound leadership Why then should we be prompted to talk leadership to you? We can only conclude that it is for the purpose of organizing a school of leadership here, a joint enterprise of your Society and the University of Rochester which will contribute significantly to the expansion of medical leadership in community and State affairs throughout the land Think of the potential activities and splendidly planned influences which could thus be set in motion! Then we would also have unplanned influences

The great divine, Horace Bushnell, once rendered a sermon on "Unconscious Influences," in which he expanded eloquently upon the thought that there is a vast extent of powerful influences ever flowing out unbidden from one's life upon society and over children which largely shape the destinies of our fellow-men, and that it is impossible to live at all and escape responsibility for these influences In speaking of a great man, an historic character familiar to us all, Paul of Tarsus, he declared that he (Paul) moved the world more by what he *was* than by what he *did* "He fought the good fight *because* he kept the faith" Thus it may be very well for us to remember that in community service as specialized citizens with remarkable knowledge and skill, our unconscious influences will flow forth unbidden and that our success in leadership may be dependent more on what we *are* than on what we *do*—however mighty and effective the doings

This thought leads us to another Superb and experienced leaders in medicine can develop those human and divine qualities that deal successfully with all kinds of organizations which are *supposed* to exist *only* for the benefit of the people, Hospitals, municipalities, states, and governments of combined states or colonies, but which so often are misdirected by ignorance, by glorifying selfish commercialism, by political ambitions or trickery, or by frank seizure of autocratic power As a group the medical profession is the most unselfish known to our world today The development of leaders who can cope with the world-tendency toward regimentation of patients and physicians and dividing the spoils among those who do *not* do the work, will mean medical statesmanship of a high order Such medical statesmen in the coming era may well secure the confidence of the people, and place medicine in the most eminent position ever attained by any group We have the glorious work, we have the practical knowledge whose appli-

Preventive Medicine

Leadership

CHARLES H GOODRICH, M D, *Brooklyn*
Presidential Address

Some one has said "Nowadays the ocean seems to be a large body of water entirely surrounded by trouble" Our own troubles —the difficulties of the physician—have grown out of the rapid expansion of medical knowledge and skill, the traditional devotion of the profession to helping people regardless of monetary return, the crafty confusion of the economics of the period, the competition of Hospitals with private practitioners, and the iconoclastic attitude of many political forces who publicly belittle our accomplishments, would control them as valuable plums to buy votes, and assure to themselves a generous share of the income which the State intended for the physician when it licensed him As themes, everyone of these factors could be largely expanded

The need for expert leadership was never so great as now The welfare and health of a great people are at stake because the life of the traditional soul of medicine is threatened We always need leadership and leadership of superior effectiveness At times we develop a Heyd—a Winslow—a Rooney—a Farmer, or an Elliott but as a rule they serve briefly and are glad to be relieved. We need more of these types on continuous duty

The qualities which medical leaders should possess are much the same as leaders in other fields The *importance* of medicine as a science and as an art *enlarges* the importance of its delivery and its public relations Therefore its leaders must have *proportional endowments* of the essential qualities of leadership

Knowledge and *ability* and *experience* are required Knowledge and ability to judge wisely in all medical issues because he can think in three dimensions about medical science and its relation to the citizenry Experience of long practical dealing with difficult problems is necessary, with a record of using these experiences for self-education and self-training

Sincerity, pure devotion to straight-forward principles involved, is another requirement. Not common honesty alone but intellectual honesty, the honesty of the Scotch preacher who prayed "O Lord guide us aright, for we are verra, verra determined."

Enthusiasm is needed, earnest controlled enthusiasm, that will not carry one too far ahead of the van or too far afield at a right angle to the point at issue Not the enthusiasm of the young lawyer who upon receiving a promotion into the firm hurried home, rushed into the arms of his greeting wife, kissed her—then rushed into the kitchen, kissed the cook and upset the soup He went too far!

A leader must possess a certain restraint. Did you ever hear a great singer who gave you of his best—and yet you felt that if it had been required he could have given you more, much more? A leader must always demonstrate that he has reserves to call upon!

Diplomacy is a *sine qua non*—not tricky, deceitful, artful diplomacy, but one rich in consideration and courtesy, strengthened by firmness—frankness—and an assurance of square-dealing, the diplomacy of a medical Elihu Root, a John Hay, or a Charles Evans Hughes

Choosing our leaders is a more important function than many of our Medical Societies realize The comparatively rare combination of essential qualities should alone determine selection The geographical location of his office, his hospital affiliations, his specialty, his church, are non-essentials However, he needs a good supply of religion!

Having chosen our leader, what are his functions? His primary functions in the Society itself are too well-known here to review In the community he, or they, should resolve the entire society into cohesive elements, interested in every feature of community life that operates for the

Read before the Monroe County Medical Society, Rochester, December 21, 1937

and small urban areas, 3,029 patients have been tested. Fifty-nine per cent were examined because of history of contact and the balance were referred to the clinics by their family physician because of symptoms or a suspicious personal or family history Sixty-two per cent of those giving a history of known contact with a case of tuberculosis reacted as compared with thirty per cent of those in whom there was no history of contact. In the age period to nine years, forty-three per cent of contacts reacted as compared with nine per cent of those with a negative contact history Between ten and nineteen years, sixty-two per cent contacts reacted and twenty-one per cent of those with no known contact. Of those over twenty years of age, seventy-eight per cent contacts and fifty-five per cent noncontacts reacted It appeared that a larger percentage of three and four plus reactions were found among persons whose exposure to tuberculosis was recent than when contact was of long duration

A third study[3] made by the Division of Tuberculosis of a selected group was the tuberculin testing and x-raying of reactors of 1,747 inmates of a state school for the feeble-minded The ages were from three to seventy years Sixty-one per cent reacted. Inasmuch as these inmates were either morons, imbeciles or idiots, no contact data were available In the age period to nine years, seventeen per cent reacted and between ten and nineteen years of age, forty-three per cent. Of those over twenty, eighty-six per cent reacted Twenty-eight or 1 6 per cent of all the inmates had clinical tuberculosis requiring supervision and treatment. In addition, there were ninety-three inmates whose x-ray revealed evidence of either healed primary or post primary tuberculosis (Table I)

To summarize relative to the first question

1 In the United States the incidence of tuberculosis infection up to ten years of age varies from twelve per cent (Slater) in rural areas to nearly 100 per cent in certain selected groups in congested areas in at least one of our largest cities

2 The percentage of reactors found in children from homes in which there is, or has been, a positive sputum case is more than seventy-five per cent as compared with thirty per cent in homes where there is a sputum-negative case (Phipps Institute)

3 At our clinics we found forty-three per cent reactors among contact children (to nine years) ages 0-9 as compared to 9 per cent among non-contact children in the same group

4 The incidence of tuberculin reactors in large but selected groups—i e college students—averages approximately thirty per cent.

5 More persons acquire their first infection during adult life than was formerly assumed

6 In comparing figures relating to tuberculin testing it must be recognized that certain inherent and technical factors in the preparation, dilution and administration of Old Tuberculin preclude accurate comparative analysis

II

In dealing with the second question—"Does primary tuberculosis present a different pathological or clinical picture from that commonly seen when infection takes place in childhood"—it must be admitted that there is little reliable data available

Quoting Pinner,[4] Pathologist of New York State Tuberculosis hospitals

There are few studies available on the pathology of primary infection in adults The work of Ragnotti on primary infections in thirty-six white adults would indicate that the essential characteristics are the same in adults as in children Studies on thousands of cases have again and again established the fact that the primary complex, composed of a parenchymatous focus and a similar one in the regional lymph nodes, is structurally characteristics for the primary infection, and for the primary infection *only*

TABLE I—RESULTS OF TUBERCULIN TESTS (P P D)
1935 STATE CLINICS and NEWARK STATE SCHOOL

Age	Contacts (Clinic)			Non contacts (Clinic)			Newark State School

cation is needed by all, we have the altruistic spirit (every *dead* physician is praised for his kindliness, devotion and generosity), and with real statesmanship there are no laudable objectives from which we may be excluded.

To attain to this elevated brand of statesmanship we must train ourselves in general management of some of those matters which at present have for most of us but a slight or at most academic interest We will touch upon three (Here was repeated essentially the same text as in a previous address on "General Management"—NEW YORK STATE JOURNAL, February 1, 1938, p 209, col 2, to end of address)

When in the eyes of the people we have made epoch-making contributions to the general management of Hospitals, the general management of illness, and the general management of life itself by preventive medicine we may indeed be leaders and furnish more statesmanship in medicine than we dare to dream of today

Primary Tuberculosis in the Adolescent and the Adult

ROBERT E PLUNKETT, M D, *Albany*
General Superintendent of Tuberculosis Hospitals, New York State Department of Health

1 How much primary infection takes place after childhood?

2 Does primary tuberculosis present a different pathological or clinical picture among adolescents and adults from that commonly seen when infection takes place in childhood?

3 Is primary infection more or less dangerous when received after childhood than when acquired during childhood?

* * *

The percentages of reactors in the various age groups throughout the United States vary in different localities, the average being well below that reported in European statistics Although the frequency of infection in adult life apparently is high, the average throughout the country at the threshhold of adulthood is about thirty per cent. Studies of selected groups reveal interesting variations in the percentage of reactors

The tuberculin testing of students in forty-two American colleges under the auspices of the Tuberculosis Committee of the American Student Health Association during 1932–1935 shows about thirty per cent reactors among 66,000 students in the late adolescent or early adult ages The variation in the percentage reactors found in different colleges, probably dependent on the relative predominance of students from rural and urban areas, is interesting University of Pennsylvania, eighty-five per cent, Johns Hopkins Medical School, seventy-three per cent, Yale University, fifty-nine per cent, University of Minnesota, 21 7 per cent. Similar studies of student nurses in a similar age group showed about fifty-five per cent.

A study by the Division of Tuberculosis of the New York State Department of Health of 3,201 students in teachers' colleges[1] showed thirty-five per cent at the time of entrance reacted positively to 1 mg of Old Tuberculin Most of these students came from rural or small urban areas, females predominated five to one, and the average age was eighteen During the first examination, nine cases of reinfection type of tuberculosis were discovered, all of whom left school and underwent treatment. Eight hundred and sixty-nine of these students have been retested and x-rayed for three successive years and one hundred and forty-three others for two successive years The increment of reactors consisted of four in the second year and a similar small number in the third year No case of reinfection type of tuberculosis has been discovered among those re-examined although the x-ray of one girl, tuberculin positive for three years, showed at the third examination a unilateral apical shadow which was interpreted as pulmonary tuberculosis No symptoms or sputum were present. This shadow dissappeared in one month and whether or not it was due to tuberculosis remains unknown

In the New York State Department of Health chest clinics[2] conducted in rural

Read at the Tenth Conference of the International Union Against Tuberculosis Lisbon, Portugal, September 7, 1936

these clinics over the past thirteen years has shown a parallel decline as compared with the drop in mortality

It has often been stated in the American literature that primary tuberculosis in the negro is more serious than in the white. It is apparent that until such time as additional data are collected relative to the many environmental factors which may play a part in the pathogenesis of the disease one cannot be sure of any real racial factor as being of major significance

Heimbeck[6] of Oslo states that among a group of nurses who had passed through childhood and the first years of youth without contracting a benign tuberculous infection one finds an appalling morbidity from tuberculosis when they are exposed. Dr Scheel has quoted at more length the findings of Heimbeck.

In reporting on eight-five cases Myers[7] states

> Our experience is that adults who develop the first infection type of tuberculosis, even with considerable involvement of the lung parenchyma and regional lymph nodes, do not require treatment. Apparently it makes little or no difference at what time of life the first infection with tubercle bacilli occurs with reference to the evolution of tuberculosis in the human body The first infection type of disease occurring during the second and third decades of life is just as benign as when it occurs in childhood.
> [He] observed no difference in the intensity of the disease or response to treatment between those cases of clinical tuberculosis developing in persons who received their first infection during the period of observation and those who were known to have been infected in infancy and childhood.

In our study of students in teachers' colleges, after all student foci were removed, no proven case of clinical tuberculosis developed among the students examined for each of three successive years, or among those examined for two successive years This is equivalent to 2,893 person years This work is being continued.

In the United States the number of persons included in many studies has been too small or the work has not been continued sufficiently long to produce convincing evidence of the significance of primary infection during adolescence or adult life

Obviously from the evidence in the literature and as the result of experience, primary tuberculous infection received after the childhood age does not appear to be more serious than when the first infection is received during that period.

In completing studies already started, or in initiating future research, greater emphasis upon environmental factors is needed. What part human contacts, working and living conditions play in the tuberculosis problem needs to be defined.

Burke[8] has shown that when small numbers of tubercle bacilli are injected intratracheally in rabbits it results in a more benign lesion than when large numbers are injected. Although this may in part explain the high death rate in infants and very young children on the basis of intimate and continued contact it does not explain the apparent relative immunity between the ages of five and fifteen in which the death rate is at the lowest point.

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B Lieber, M D, Dr.P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Subnormal Intelligence

Preventive medicine, dealing as it does with the prevention of complications, is far from health conservation or actual disease prevention In the same sense the description of the extremely frequent cases of *subnormal intelligence* and of its care and training—there can be no question of real healing—is closer to preventive medicine than to the

Pinner feels, however, that the conclusion that the first infection is benign and the second infection malignant, in the light of our present knowledge is unjustified Quoting Opie [5]

No simple formula will explain the pathogenesis of tuberculosis in all of its varied manifestations Tuberculosis of adult type usually has its origin in the apical or subapical part of the upper lobes of the lungs, whereas tuberculosis of children may occur in any part of the lungs, not more frequently in the apex than elsewhere. Caseous tuberculosis of adjacent lymph nodes is its characteristic feature. Unfortunately, with regard to its recognition during life, tuberculosis of first infection affects the apices with increasing frequency in adolescence and adult life. Some years ago I described an instance of apical tuberculosis in a negro woman 37 years of age with massive caseous tuberculosis of the regional lymph nodes, tuberculosis of the vertebrae, and death from generalized miliary tuberculosis Some pathologists have regarded such apical lesions with caseous tuberculosis of adjacent lymph nodes as characteristic of the disease in adolescence, but Beitzke and others have denied this relation. In negro adults of Jamaica the writer has seen apical lesions of first infection accompanied by caseous tuberculosis of adjacent lymph nodes In forty-four adult American negroes Everett found tuberculosis resembling that of white infants in nine instances, in thirteen instances the disease had similar characters, but evidently had had its origin near the apices of the lungs In the remaining half of these lesions the disease had the character of the adult type of white persons In twenty-one instances of pulmonary tuberculosis in white persons examined for comparison all save two were of characteristically adult type. Of the two lesions of first infection or childhood type, with caseous tuberculosis of regional lymph nodes, one was basal and the other apical

Erythema nodosum as the primary exanthema of tuberculosis is apparently considered rarer in America than in northern Europe As a matter of fact, in our service this phenomenon is extremely uncommon.

It has been our experience that children, even when showing x-ray evidence of the pneumonic stage of primary infection, are usually asymptomatic and are apparently as healthy as negative reactors Rather than to place grave significance upon this type of x-ray shadow, it is felt that its discovery is accidental in that the patient is examined at the time when the pathological phenomenon was present.

To summarize the answer to the second question, there does not appear to be any proof that primary tuberculosis presents any different pathological or clinical picture in the adult than in childhood. It must be admitted that it is difficult and sometimes impossible to differentiate clinically between primary and secondary infection.

III

The third question as to whether primary infection received during adolescence or adult life is more or less dangerous than that acquired during childhood again can not be answered specifically In itself primary infection is usually benign and requires no treatment. There is no evidence in the United States that primary infection in the white adult is any more serious than in the child Myers reports, "the first infection type of tuberculosis as observed in our group of adults has resulted in no significant symptoms or abnormal physical signs throughout its entire course of development." Broadly speaking, the tuberculosis mortality statistics for the United States Registration Area are of interest. In other words, while the average age at which primary infection is acquired has presumably increased, tuberculosis mortality and morbidity have decreased.

Although the answer to this question cannot be gleaned from a study of mortality statistics, they are of interest in that the tuberculosis death rate for the United States Registration Area has declined seventy-three per cent from 1900 to 1935 The rate under five years of age has declined eighty-five per cent among boys and eighty-four per cent among girls, from five to nine, boys seventy-six per cent, girls eighty-one per cent. Between the ages of ten to fourteen the boys' rate has declined seventy-one per cent and the girls' seventy-six per cent, between the ages of fifteen and nineteen the boys' rate has declined seventy-nine per cent and the girls' seventy-four per cent. The rate among men, ages twenty to twenty-four, has declined seventy-nine per cent and to about the same degree until forty-forty-four, in which age period the rate has declined only sixty-nine per cent. The rate for women, ages twenty to twenty-four, declined seventy-three per cent and ages twenty-five—twenty-nine, seventy-eight per cent. No accurate morbidity statistics are available but in our statewide clinic service the percentage of cases of tuberculosis seen at

these clinics over the past thirteen years has shown a parallel decline as compared with the drop in mortality

It has often been stated in the American literature that primary tuberculosis in the negro is more serious than in the white. It is apparent that until such time as additional data are collected relative to the many environmental factors which may play a part in the pathogenesis of the disease one cannot be sure of any real racial factor as being of major significance.

Heimbeck[6] of Oslo states that among a group of nurses who had passed through childhood and the first years of youth without contracting a benign tuberculous infection one finds an appalling morbidity from tuberculosis when they are exposed. Dr Scheel has quoted at more length the findings of Heimbeck.

In reporting on eight-five cases Myers[7] states

> Our experience is that adults who develop the first infection type of tuberculosis, even with considerable involvement of the lung parenchyma and regional lymph nodes, do not require treatment. Apparently it makes little or no difference at what time of life the first infection with tubercle bacilli occurs with reference to the evolution of tuberculosis in the human body The first infection type of disease occurring during the second and third decades of life is just as benign as when it occurs in childhood
> [He] observed no difference in the intensity of the disease or response to treatment between those cases of clinical tuberculosis developing in persons who received their first infection during the period of observation and those who were known to have been infected in infancy and childhood.

In our study of students in teachers' colleges, after all student foci were removed, no proven case of clinical tuberculosis developed among the students examined for each of three successive years, or among those examined for two successive years This is equivalent to 2,893 person years This work is being continued

In the United States the number of persons included in many studies has been too small or the work has not been continued sufficiently long to produce convincing evidence of the significance of primary infection during adolescence or adult life.

Obviously from the evidence in the literature and as the result of experience, primary tuberculous infection received after the childhood age does not appear to be more serious than when the first infection is received during that period

In completing studies already started, or in initiating future research, greater emphasis upon environmental factors is needed. What part human contacts, working and living conditions play in the tuberculosis problem needs to be defined

Burke[8] has shown that when small numbers of tubercle bacilli are injected intratracheally in rabbits it results in a more benign lesion than when large numbers are injected Although this may in part explain the high death rate in infants and very young children on the basis of intimate and continued contact it does not explain the apparent relative immunity between the ages of five and fifteen in which the death rate is at the lowest point.

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Subnormal Intelligence

Preventive medicine, dealing as it does with the prevention of complications, is far from health conservation or actual disease prevention. In the same sense the description of the extremely frequent cases of *subnormal intelligence* and of its care and training—there can be no question of real healing—is closer to preventive medicine than to the

preservation of normal mental health When presenting abbreviated, condensed sketches or glimpses of situational conflicts and minor or incipient manifestations of mental illness, all we do is to emphasize the transition cases, which are so important to the general practitioner But we cannot speak about transition in the more or less fixed and hardly changeable cases of *hypophrenia,* except when they are *near* the normal mentality Not even these can cross the—imaginary—line, but they do connect normality with subnormality If we describe them in this light we are bound to remain modest as far as our therapeutic attainments are concerned

It is true that the parents are our first guide in shaping a diagnosis or an understanding of the case But we must be on our guard and form our own opinion, as they may be misleading Just as some overpraise the intelligence of their progeny—because it is theirs—others underrate it because of prejudice or stupidity, as it has been shown in our series in the past, on these very pages

One despairing father thought his boy to be mentally low and that he would surely become a criminal because of the theft of a dime and a propensity to play hooky But the child was above normal and studious in his own way The father was both cured of his suspicion and surprised to hear the doctor accusing himself of the same "crimes" Indeed, as a youngster of nine or ten he too, in spite of his reputation as a "good boy" and an excellent scholar, stole a quarter from the house and, hating the teacher of that particular semester—the usual reason—began to explore the city and the adjoining countryside instead of going to school To be sure, that was a sign of normal intelligence in his case and he was certain to have learned in two weeks outdoors more than in an entire year in the class room, what with watching the people buying and selling and fighting in the market place, listening to beggars at church doors and to street fakers, looking at pavement repairers and bridge builders, admiring bricklayers and umbrella menders, and following the hearses and the mourners to the cemetery After a while when one morning he wanted to end his odyssey and to put in an appearance in school, he did not know how because he lacked an excuse Then his mother, like *a deus (dea) ex machina,* solved the problem She had silently followed him for days and as he was gazing into the depths of the brook and following the graceful meanderings of the small fish schools, she suddenly appeared There she stood like Napoleon Bonaparte in the famous picture, in front of the dozing sentinel, her countenance sad and serious and her arms folded in stark resolution. Instead of the cry of terror *"l'Empereur!"* he only muttered "mom" She never said a word and marched him straight to school Nor did she ever call him thief or nincompoop or consult a doctor on that account.

Or take the case of a wealthy person's boy who, in the parents' eyes, was brightness itself, apparently mistaking as they did a certain deceiving superficial smartness and cunning for intelligence. They could not see why he was untinterested in any kind of learning, why even private tutoring or an expensive boarding school accomplished nothing They were dumbfounded when he forged checks, stole substantial sums from the servants' pocketbooks, borrowed in his father's name, or hurled dishes at his mother and bit his siblings to the blood—and enjoyed it all and grinned at the reprimands He was simply *dull* and did not know exactly what he was doing His dad, a severe executive in a big business concern, capitulated before the child He thought himself wise to have brought up the boy with a view of success in the industrial and commercial world. So he instilled in him the most ungenerous sentiments intentionally, preparing him to be a perfect exploiter, to love the dollar for its own sake, and to admire those who were stuffed with it. The reaping was in accordance with the sowing Nay, worse. It acted like a boomerang

Was this boy—and are such children—responsible?

While responsibility for the actions of any lawless person and especially of such individuals is a mooted question, it should be estimated from case to case The farmer, when he wanted to give a spanking to the town moron who climbed his trees and stole his apples, evidently knew that. His wife told him "Leave him alone, he is not all there" To which the farmer replied, "There is enough of him for my purpose."

I know of another case where the parents were convinced about the fourteen year old child's high mental power because her spelling was good, or rather not as bad as it might have been But she had no idea what a cloud or smoke was, where the rain came from, and how we get milk or potatoes

One mother, believing her boy a genius, had spoiled him from the start. I used to see them both when he was a baby, but my influence was nil He never ate an egg, but "a little egg" His bowel movements were "wonderful" Every word he uttered was praised as something marvelous and repeated and carried around to neighbors and relatives His favorite sport and pastime was to hit her several times daily She not only tolerated it, but encouraged him by laughing as if it were the wittiest thing

But when her son was fifteen she came to the clinic to complain about his criminal tendencies

A big change had taken place in her life. The Fates had dictated that she fall down from her comfortable middle class position to that of a proletarian person, sometimes even into the *lumpen-proletariat* She was now better informed about the boy, but it was too late.

She herself, though uncultured, was highly intelligent and had always been so, except about her child. A sample of her way of talking will show how deeply and bitingly critical she could be in her own idiom and at the same time will describe the economic situation of the family

"Yes, doctor, the rich think that we poor people are monkeys in a cage. The other day a lady looking like dressed beef and about whom the neighbors said she was worth all sorts of money—that was all she was worth—came slumming and pushed my door open It seems she had to write us up for her club or for her post what do you call it? post-graduate course She smiled, but never helped us No, she insulted us She looked at our room and said, 'What a nice kitchen you have.' Kitchen indeed, it was our parlor"

This reminded me of the scene in Ibsen's Hedda Gabler, where the haughty young woman humiliates her husband's aunt by crumpling her newst hat or mistaking it for the servant's old bonnet.

Then our informant added

"As to being poor, we are poor all right. We are certainly worth being gaped at. They never seen anything like it Sometimes I feel we should be gettin' off the earth I carry an idea that my husband'll have no work the whole winter We'd be perfect financially if we had no rent to pay, 'cause then only food would be missing I mean, not for the boy He'd never go without. We give him everything"

It was true. He was a tall and blond beast, well fed and decently clothed

The problem as she saw it was his cruelty to her Why? She asked again and again She had been so good to him

He often knocked her down and threw a knife at her, sometimes injuring her When told that he might kill her he shrugged his shoulders and said in an indifferent tone "That'd be too bad"

He would hold up his visiting grand'ma and, with his threatening knife, would force her to let him ransack her pocketbook, as he had heard in the stories of the lower world heroes

A five minute conversation with him would convince anyone except a mother that he was a very dull individual in spite of the fact that he had passed the grades and was about to finish elementary school

It was apparent that his next graduation would be from some crime class And in our environment where the money incentive is so prevalent and in the hands of a really intelligent and clever gangster he would be a willing tool. Here was a character from "Dead End" stepping down from the stage into real life.

What is there to be done? The best prevention is the proper upbringing—that is to teach the parents, where it is possible. But not all the cases are as bad as those described in this article. I have seen families where much was done to mitigate the evil

(In an early issue I will give the readers a list of the signs by which intelligence could be evaluated in the very young in a plain, non-technical way)

611 W 158 St

Erratum

In the case report entitled "Doctors Beware!" (January 15 issue, page 131) instead of "Four years later she was not entirely normal, but *superior* to the average child of the same age," it should read "Four years later she was not only entirely normal, "

We regret this proofreading error and extend our apologies to Dr B Liber, the author

---

WHY NOT STUDY THE WELL, AS WELL?

Prof Earnest A Hooton, of Harvard, suggests in *The Forum* the establishment of an institute to study the well, instead of the ill, because it is difficult to make a man well unless we understand a well man He calls attention to the amazing fact that, though we have millions of case studies of sick persons, there is not in the world today one single complete study of a well and normal human being

Hence he recommends the establishment of a scientific institute for the intensive and prolonged study of healthy human beings This might accomplish even more than the study of pathology in the promotion of sound medical practice.

preservation of normal mental health When presenting abbreviated, condensed sketches or glimpses of situational conflicts and minor or incipient manifestations of mental illness, all we do is to emphasize the transition cases, which are so important to the general practitioner But we cannot speak about transition in the more or less fixed and hardly changeable cases of *hypophrenia,* except when they are *near* the normal mentality Not even these can cross the—imaginary—line, but they do connect normality with subnormality If we describe them in this light we are bound to remain modest as far as our therapeutic attainments are concerned

It is true that the parents are our first guide in shaping a diagnosis or an understanding of the case But we must be on our guard and form our own opinion, as they may be misleading Just as some overpraise the intelligence of their progeny—because it is theirs—others underrate it because of prejudice or stupidity, as it has been shown in our series in the past, on these very pages

Sound Principle

Almost identical measures sponsored by Assemblymen Brenner and Holley reflect a growing appreciation of the need for regulation of the trade in food, drugs, and cosmetics These products, which are part of the daily pattern of every one's life, are manufactured, advertised, and sold with insufficient safeguards for the consumer Existing Federal legislation is incomplete and weak Local ordinances attack isolated evils Mr Brenner and Mr Holley take a broad view of the problem and attempt a comprehensive solution

Both measures establish a Consumers' Bureau in the State Department of Health to study scientific aspects of the manufacture of foods, drugs, and cosmetics and regulate distribution A research committee is created to investigate allergic susceptibility, tolerances for poisonous ingredients, and similar questions. The bills prohibit adulteration, the introduction of dangerous elements into preparations, and false or exaggerated advertising To enforce the ban, annual registration of all proprietary products is required

The basic principle of both the Brenner and the Holley Act is entirely sound Further study will determine whether the methods proposed are feasible in all their details

With national advertising and distribution, a Federal food, drug, and cosmetics bill would be more effective and less irksome than state legislation. If the manufacturer is obliged to register his products in the individual states and comply with different rules in each one, he will find himself lost in a maze of conflicting and confusing regulations

The consumer of foods, drugs, and cosmetics must have protection against improper manufacturing and advertising practices The Brenner and Holley bills show that if Washington does not provide it, the state legislatures will The industries affected can obviate the need for state action by getting behind a reasonable Federal law

World's Fair Exhibit on Man and His Health

We have watched the development of the plans for the health exhibits at the coming World's Fair with more than usual interest As far as we know, this is the first time that officials having the matter in hand have turned to the medical profession for help in producing a coordinated exhibit, where neither individuals nor organizations will be specifically featured Here the exhibit instead will feature the health factor, its aberations, and the best that medicine in its present state of knowledge has to offer in prevention, amelioration, cure, and return to normalcy

The very basis upon which the exhibits are being planned is in all respects a presentation of subject matter without emphasis on, or exploitation of, the product concerned Although not featuring the sponsoring organization as such, it gives them generous recognition

The list of those assisting the World's Fair authorities in this endeavor reads like a medical "Who's Who"

The method adopted to finance the exhibits commands respect The finances are being underwritten by sponsors In some instances these are outstanding commercial firms of the highest ethical rating, and in other instances the finances are being underwritten by important noncommercial agencies or public-minded individuals—not necessarily medical men These people and organizations are supporting this project because of their inherent interest in the advancement of medicine and public health

Our profession will appreciate the absence of commercial drug firms interested in what we are wont to call "proprietary or patent medicines" The less the public is shown this type of medicine, the better naturally is the public health We, who know the evils inherent in the blatant advertising which induces self-medication, can best comprehend what a step in the right direction results when the World's Fair exhibit on "Man and His Health" will be conspicuous by the absence of

Medicine Continues Onward

Recent action by the A M A toward the development of medical service plans throughout the country is not revolutionary, as many newspapers profess to believe Long before politicians and the lay public awoke to the need, the medical profession was seeking the key to better medical care for all the people

Medical education, which is the foundation of medical service, reached its present high development in this country almost entirely through the efforts of the organized profession Without hysteria, without burdening the taxpayer with the expense of clamorous investigative commissions or elaborate administrative systems, the A M A brought about unprecedented reforms in medical education and hospital service This work is still going on—and achieving its ends without sensational publicity or inflammatory appeals to popular fears

Similarly the medical profession always was and is today the prime mover for more effective distribution of medical service The domiciliary care of the needy sick, ward and dispensary services, depend principally on the unselfish labors of the private practitioner In conformity with the changing times physicians acknowledge the desirability of an organized attack on the problem of medical indigence in preference to individual measures They cannot, however, subscribe to methods which place the system above the patient or subordinate medical judgment to administrative routine

This is a large country, with wide variations in economic, educational, social, and medical conditions As Dr Fishbein recently declared before the Medical Society of the County of New York, "What is needed to answer the problem of medical care for the American people is not a PLAN but SCIENTIFIC PLANNING"

Such planning is going on all over the country under the auspices of organized medicine Many countries already have systems in operation which are functioning satisfactorily It is the aim of the profession to set up suitable machinery in every state and county to satisfy local medical needs In the interests of economy and efficiency, existing resources will be utilized to their fullest extent

The Medical Society of the State of New York and its constituent county organizations have a deserved reputation for progressivism They will not lag behind other states in the next great step in the evolution of American Medicine. *Let's go!*

consists of an acid alcohol precipitation of the proteins and the removal of lipoids and peptones The water soluble extract which is obtained as yet has not been standardized in the same manner as has insulin or the parathyroid hormone From physiological tests, however, it possesses a diuretic action, and an effect on the mobilization of chlorides in the blood and their excretion in the urine. A substance similar in action to the one reported by Jablons has been isolated from the blood in the renal vein by Tokumitsu[2] who termed it a nephrohormone

In half of the cases of nephritis complicated by hypertension, the use of this extract resulted in a noticeable decline in the blood pressure Diuresis and the excretion of salt were markedly increased and the edema present disappeared During the preuremic stage and in chronic uremia, the reported results seem to indicate that the nausea, vomiting, and head ache can be controlled to a considerable extent by the injection of the extract In three instances wherein an albuminuric retinitis was present, absorption of the retinal exudate and a return of vision followed its use

This investigation is a step in the proper direction The report of Jablons is an encouraging one in the therapy of the nephritic lesions which almost inevitably shorten life Standardization of the extract and corroboration of the work should be undertaken as the next step, and efforts directed toward identifying the potent factor Whether or not the kidney in itself possesses an active hormone or a chemical which is capable of producing hypertension *must still remain* a problem which awaits further experimentation for ultimate proof

CURRENT COMMENT

"WHAT IS LIBERTY IN A country of railroads and automobiles, chain stores and radios, trusts and labor unions? Can we hope to find liberty among the struggles of capital and labor, the rise and fall of financial empires, and the confusion of political controversy? And after all, is liberty worth the cost of hunting for it among these strange new powers that wrestle and trample across our country? Or would it be better to give up the dreams of the pioneers and to look for security and plenty without the dangers and uncertainties of freedom?

"Liberty has to be founded on security.

The pioneers had to make themselves secure against starving to death or being tomahawked by the Indians before they could settle down to enjoy the blessings of liberty in America. "—The foregoing comes from an article by David Cushman Coyle, which won the $1000 prize offered by *Harper's Magazine* for the best paper on "The American Way"

In another vein, Mr Coyle continues "There is some ground for the fear that in letting science loose in the world the human race may have released a demon that will destroy mankind. President Hoover's Committee on Social Trends pointed out that changes in laws and vested rights lag behind the changes caused by science and invention 'There is in our social organizations an institutional inertia and in our social philosophies a tradition of rigidity Unless there is a speeding up of social invention or a slowing down of mechanical invention, grave maladjustments are certain to result.' This cultural lag between different elements of the national life creates severe strains which appear in the form of personal insecurity and wild fluctuations of business

"Compared with the insane, weird terrors of the dictatorships, our own riots, labor wars and crime seem like simple, normal outbursts of human nature We believe that Americans would do better to feel their way slowly and trust to luck rather than to march howling into any such madhouse

"We have the resources and the power, if we dare to use them boldly, to build our country in strength and freedom, so that all Americans may walk secure and confident, the masters of a rich heritage and of a future bright with promise Not by basely throwing away freedom can we flee into a safe hiding place under the wing of some dictator, but in the pursuit of liberty itself we shall find the only security that is secure."

"'THE TERM SPECIALIST CARRIES with it an implication of superior training and a background of extensive clinical experi-

all that group of "panaceas" whose alleged virtues the less ethical press, and the less conscientious radio stations, continually are expounding to the public

It is indeed gratifying to note even at this early time that sufficient financial support is in view to keep this exhibit on the high plane upon which the medical advisory committee and the World's Fair authorities have conceived it It augurs well for the conception which is gaining ground that after this World's Fair is over, this excellent exhibit—with such additions as may be found advisable —will remain permanently as a "Museum of Hygiene" to continue its usefulness in carrying on a continuing program of health education

Danger of Facial Pimples

One of the most serious infections, but nevertheless one whose gravity is little appreciated by the laity, is that which occurs in the region between the upper lip, and the hair line of the scalp The most common site of this lesion is in the vestibulum naris, the upper lip or the cheek just lateral to the nose The infection, which most frequently is produced by Staphylococcus aureus, gains entrance to the soft parts through an abrasion or a minor injury to the skin, or mucous membrane of the nose It may follow shaving of the upper lip, picking of the nose, the removal of the nasal vibrissae, or some such other insignificant form of trauma

To the layman, it represents merely a "pimple" which causes a mild degree of annoyance The natural tendency which exists in all of us to "pick at a pimple" is, in all probability, the responsible factor for the high mortality which follows infection in this area of the face The venous channels which drain this site are not equipped with valves, and consequently furnish readily accessible channels through which the infection may spread The involvement of the angular vein by a septic thrombus which can extend to encompass the ophthalmic vein and cavernous sinus is the most frequent method of extension A fatal staphylococcemia often complicates the innocent looking primary infection

The repeated warnings in the literature have been added to recently by the contribution of Elliot[1] The complete abstinence from all surgical measures, until such time as definite evidence is at hand to show that frank suppuration exists, must be strictly observed Hot moist poultices seem to afford the best means of therapy During the invasive stage, blood transfusions, the injections of foreign protein and roentgen therapy may be employed and have been found to be beneficial Above all, however, is the complete avoidance of any additional trauma to the already infected part Such trauma most often will be inflicted by the patient himself It usually can be avoided by impressing the sufferer with the fatal aspects of the lesion There are many physicians who routinely warn *all* their patients against "picking" pimples in this dangerous locality

A Diuretic Renal Extract

The search for an extract of the renal tissues which would be effective in the treatment of kidney disease has been in progress for a number of years The chief difficulty in the past has been the methods used for the extraction of a substance, none of which excluded from the end product those depressor factors which normally are present in animal tissue These are the result of nucleoprotein disintegration and include among others, the guanadins, the cholines, histamines, and adenosines

Jablons[1] appears to have been successful in the isolation of a potent substance from the fresh mammalian kidney which is free of the nucleoproteins Unlike the other methods employed, his

COMMITTEE ON LEGISLATION

Bulletin No 3

January 24, 1938

New Bills Introduced

Senate Int. 268—Hanley, Assembly Int. 344—Canney, establishes a division of food in the Health Department to investigate economical methods of preparation, value and standards for foods served for human consumption, to establish code of fair competition for employers and employees preparing and serving foods, and appropriates $50,000 Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Comment This bill has been before the Legislature a number of times It provides for inspection by the Department of Health of the manner in which food is prepared and the places where food products are manufactured, and also the manner in which it is prepared in hotels and restaurants It would set up a new division which would require a very large staff

Senate Int. 269—Hanley, Assembly Int. 349—Canney, establishes a division of food in the Labor Department to investigate economical methods of preparation, value and standards for foods served for human consumption, to establish code of fair competition for employers and employees preparing and serving foods, and appropriates $50,000 Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Comment Identically the same bill as Senate Int. 268, except that the clauses which it contains regarding the protection of the employees against labor abuses and granting them the right of collective bargaining, etc., are referred to the jurisdiction of the Commissioner of Labor

Senate Int. 278—Warner, Assembly Int. 443—Marble, provides for filing of duplicate certificate of birth occurring in any district other than that in which mother resided at time of birth, with registrar of district in which mother resided. Referred to the Health Committees

Comment When a child is born in a hospital to which the mother has come from another county, a record of the birth is filed in the county where it occurred, and later in life if the child seeks a record of its birth, it will not be able to find the record in the county where it has been residing This bill obviously is an attempt to prevent a difficulty of that kind, but it is hardly necessary because the proper procedure in securing copies of birth certificates for any citizen in the State is to apply to the State Department of Health, where copies of all records are kept, filed alphabetically and chronologically

Senate Int. 388—Feld, regulates the practice of electrolysis, defined as the removal of hair by use of electric needles, and provides for appointment by the Regents of an examining board of electrolysis Referred to the Education Committee.

Comment This bill has been before the Legislature for several years It is worth knowing in this connection that the Court of Appeals, during the summer, handed down a decision that the practice of electrolysis is not the practice of medicine.

Assembly Int. 351—Crews, provides for eight-hour day and forty-eight-hour week for all employees in hospitals, and for one day of rest in seven. Referred to the Labor Committee.

Assembly Int 358—Ostertag, provides that Sanitary Code may include provisions for sanitary regulation of house coaches and tourist camps Referred to the Health Committee.

Comment The bill would require the registration of the occupants of house coach camps, tourist camps, and house coaches, and an inspection of the provisions for plumbing, drainage, water supply, and disposal of garbage and other refuse. Prevents the erection of location of any house coach, tourist camp, etc. in the State without a certificate from the Department of Health Grants the Department of Health the right to adopt and enforce other regulations which it may find necessary A house coach is defined as "any vehicle or movable structure motivated by power connected therewith or propelled by a power within itself which is or can be used as the home or living abode or habitation of one or more persons either temporarily or permanently" The terms "house coach camp" and "tourist camp" are defined to mean "any land, structure or enclosure, operated for gain, where house coaches are permitted to locate or park for a valuable consideration or in conjunction with the renting of cabins or rooms or the furnishing of food" Violations shall be considered a misdemeanor

Assembly Int 364—Brenner, creates in the Health Department a consumers' bureau for registration, advertising control, analysis, scientific research, education and publicity of manufacture and sale of foods, drugs, cosmetics or health devices, and for regulating traffic therein Referred to the Health Committee.

ence, and no physician is warranted in posing as a specialist unless he is really expert in his chosen field. The essential skill can be acquired only by extensive study, prolonged training and wide experience The public has a right to expect the medical profession to safeguard it from mushroom specialists'"—At the fifty-sixth annual dinner of the Faculty Association of the New York Post-Graduate Medical School and Hospital held on January 29, "the need for more graduate instruction in medicine and the present method of certification and control of specialization were discussed" We have quoted Dr Walter T Dannreuther, President of the American Board of Obstetrics and Gynecology, in regard to the situation

The New York Times of January 30, from which we have taken the foregoing excerpts, quotes Dr Willard G Rappleye, president of the advisory board for medical specialties and Dean of the College of Physicians and Surgeons of Columbia University, as follows "There is general agreement that the greatest need of American medicine is for better rather than for more physicians While there is wide discussion of the economic and social factors involved in the medical care of the population, thoughtful leaders have recognized for centuries that the well-trained, honest and competent physician is the most important single element in a satisfactory health service for the country, however that service may be organized or financed" [See page 297 for complete text of address]

FROM THE REGULAR CORRESPONDENT to the *J A M A* from France, under date of January 29, we learn that this will not be a happy new year for the French practitioner "Most of the medical journals here contain articles at the end of 1937 which picture the future in very somber colors The social insurance authorities are in great measure responsible for this First they have just established a new scale of remuneration for sickness claims Although no change has been made in the amount of indemnity granted for services rendered at the office of the practitioner or in the domicile of the insured, they now indemnify the insured as much for services rendered by a dispensary, whether it is a private or public one The objective of the insurance authorities is to force the profession to lower its fee table, which is already so low that the average practitioner can hardly pay his expenses All in all, the practitioner's lot here is not happy, as he is caught between efforts to socialize medicine and the necessity of raising additional taxes every year"

Correspondence

Asphyxial Death in Surgery of the Neck

New York City
40 E 61 St.

To the Editor

The mechanical problem presented by acute infections of the neck is so often overlooked that it appears desirable at this Season to rehearse conditions in the field predisposing to sudden death in the course of operative procedures

Acute infection or edema of the upper airway implies edema of the superglottic region An airway embarrassed by abscess or edema often remains open by virtue of the muscle tone of the part. If this muscle tone is destroyed by basal anesthetics, avertine, the barbiturates, evipal, etc., or by topical local anesthesia, death from acute asphyxia promptly ensues On the other hand, nitrous oxide, oxygen, ether, etc, by increasing engourgement of the part frequently produces fatal obstruction

Emergency tracheotomy following complete respiratory obstruction is accompanied by a high postoperative mortality Experience suggests that the following sequence be employed in order that both mortality and morbidity may be reduced

Intubation may be accomplished deliberately with the assistance of chloroform anesthesia carried to a point where the pharyngeal reflexes and muscle spasm are under control Following intubation, any anesthetic agent may be employed The endotracheal tube may be left *in situ* following operation for a period of twenty-four hours The presence of the tube does not cause edema. Edema of the region is reduced as the result of the operative interference and free ventilation The reduction of edema will be noted in the patient's tendency to breathe around the endotracheal tube

When emergency tracheotomy is indicated, this should always be preceded, when possible, by intubation Intubation permits deliberate approach to the trachea, skeltonization of the trachea, and not infrequently, complete avoidance of tracheotomy

New Bills Introduced

Senate Int. 268—Hanley, Assembly Int. 344—Canney, establishes a division of food in the Health Department to investigate economical methods of preparation, value and standards for foods served for human consumption, to establish code of fair competition for employers and employees preparing and serving foods, and appropriates $50,000 Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Comment This bill has been before the Legislature a number of times It provides for inspection by the Department of Health of the manner in which food is prepared and the places where food products are manufactured, and also the manner in which it is prepared in hotels and restaurants It would set up a new division which would require a very large staff

Senate Int. 269—Hanley, Assembly Int. 349—Canney, establishes a division of food in the Labor Department to investigate economical methods of preparation, value and standards for foods served for human consumption, to establish code of fair competition for employers and employees preparing and serving foods, and appropriates $50,000 Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Comment Identically the same bill as Senate Int. 268, except that the clauses which it contains regarding the protection of the employees against labor abuses and granting them the right of collective bargaining, etc, are referred to the jurisdiction of the Commissioner of Labor

Senate Int. 278—Warner, Assembly Int. 443—Marble, provides for filing of duplicate certificate of birth occurring in any district other than that in which mother resided at time of birth, with registrar of district in which mother resided Referred to the Health Committees

Comment When a child is born in a hospital to which the mother has come from another county, a record of the birth is filed in the county where it occurred, and later in life if the child seeks a record of its birth, it will not be able to find the record in the county where it has been residing This bill obviously is an attempt to prevent a difficulty of that kind, but it is hardly necessary because the proper procedure in securing copies of birth certificates for any citizen in the State is to apply to the State Department of Health, where copies of all records are kept, filed alphabetically and chronologically

Senate Int. 388—Feld, regulates the practice of electrolysis, defined as the removal of hair by use of electric needles, and provides for appointment by the Regents of an examining board of electrolysis Referred to the Education Committee

Comment This bill has been before the Legislature for several years It is worth knowing in this connection that the Court of Appeals, during the summer, handed down a decision that the practice of electrolysis is not the practice of medicine

Assembly Int 351—Crews, provides for eight-hour day and forty-eight-hour week for all employees in hospitals, and for one day of rest in seven Referred to the Labor Committee.

Assembly Int. 358—Ostertag, provides that Sanitary Code may include provisions for sanitary regulation of house coaches and tourist camps Referred to the Health Committee.

Comment The bill would require the registration of the occupants of house coach camps, tourist camps, and house coaches, and an inspection of the provisions for plumbing, drainage, water supply, and disposal of garbage and other refuse Prevents the erection of location of any house coach, tourist camp, etc. in the State without a certificate from the Department of Health Grants the Department of Health the right to adopt and enforce other regulations which it may find necessary A house coach is defined as "any vehicle or movable structure motivated by power connected therewith or propelled by a power within itself which is or can be used as the home or living abode or habitation of one or more persons either temporarily or permanently" The terms "house coach camp" and "tourist camp" are defined to mean "any land, structure or enclosure, operated for gain, where house coaches are permitted to locate or park for a valuable consideration or in conjunction with the renting of cabins or rooms or the furnishing of food" Violations shall be considered a misdemeanor

Assembly Int. 364—Brenner, creates in the Health Department a consumers' bureau for registration, advertising control, analysis, scientific research, education and publicity of manufacture and sale of foods, drugs, cosmetics or health devices, and for regulating traffic therein Referred to the Health Committee.

Comment The bureau shall be operated by a director appointed by the Governor, and a committee on public health of five members, appointed by the Governor The committee shall investigate scientific problems relating to tolerances for poisonous ingredients and allergy or susceptibility Every manufacturer or proprietor of a proprietary product sold in this State shall register it and procure a numbered certificate, for which a fee of $25 00 shall be paid, and $10 00 for annual renewal Every applicant for a certificate of registration shall submit (1) The true and complete qualitative and quantitative composition or formula of the product sought to be registered, (2) The exact text of every judgment, decree, order or stipulation relating to such product entered or issued by any court, federal trade commission or other governmental agency, (3) "A statement of all the therapeutic, palliative or other beneficial effects claimed or to be claimed for such product in its sale, together with satisfactory evidence or authority in support of such claim", (4) Names of those under whose supervision the product is manufactured Certificates shall be denied (1) If accompanied by a false or misleading statement, (2) Contains poisonous or deleterious substance, (3) Contains any ingredient in excess of that determined as safe, (4) If applicant makes claim for the product which can not be supported by scientific or medical opinion, (5) Adulteration, (6) Product is not manufactured under proper supervision No appropriation is provided, for it is believed that the bureau can support itself on registration fees collected.

Assembly Int 380—McCaffrey, strikes out provision that physician in workmen's compensation cases, as employee or carrier may select and pay for, may participate in examination if employee or carrier so requests Referred to the Labor Committee.

Assembly Int. 381—Methfessel, requires not more than twenty days preceding application for marriage license, examination of parties by a physician who must make a written report stating whether he finds person examined is suffering from gonorrhea or syphilis, or epilepsy, heart disease, tuberculosis or other infectious disease, copy to be mailed to the other party to marriage, and relative to duties of town or city clerks in connection therewith Referred to the Judiciary Committee.

Comment The bill specifically states that the confidential relationship between patient and physician shall be waived for the purpose of making this report, and the physician shall be held free from libel or slander because of any statement contained in the report, and also that the "physician who wilfully conceals or fails to state in such report the existence of one or more of the diseases above mentioned, shall be guilty of a misdemeanor" It further provides that "a marriage is void from the time its nullity is declared by a court of competent jurisdiction if either party thereto is, at the time of the marriage, suffering from gonorrhea or syphilis in the infectious or transmissible stages"

Assembly Int. 397—Burgdorf, requires that regulations of the Public Health Council for qualifications for certain public employees whose duties pertain to enforcement of Sanitary Code, be incorporated in such Code Referred to the Health Committee.

Assembly Int. 398—Burgdorf, provides that commissioner, deputy commissioner, assistant commissioner or physician employee of the State Health Department shall not be liable for damages because of official acts, and permits claims for damages to be brought in Court of Claims Referred to the Health Committee

Assembly Int. 435—Flynn, prohibits person from negotiating within fifteen days after accident for a settlement or obtain general release or statement from person sustaining personal injuries Referred to the Codes Committee

Assembly Int. 436—Flynn, prohibits person from negotiating within fifteen days after accident, a settlement or obtaining release or statement with reference to injury, from a person confined in hospital or sanitarium Referred to the Codes Committee.

Assembly Int. 439—Garcia-Rivera, provides home relief recipients shall receive not less than $10 00 a week each and not less than $3 00 for each dependent, and there shall be adequate allowance for rent, special diet, food, medical care, clothing, and household incidentals, persons living apart from family shall not be compelled to live with his family in order to receive relief Referred to the Relief and Welfare Committee.

Assembly Int. 492—Suitor, provides for care of indigent persons suffering from motor vehicle injuries in hospitals not organized for profit and registered by the State Health Department, per diem cost not to exceed $6 00, and appropriates $350,000 Referred to the Ways and Means Committee.

Comment This is the third year that Mr Suitor has carried this bill. The comment that was made on it last year can be repeated It is framed along the lines of an Ohio law Conditions under which hospitals are financed differ so much in the

two states that probably this provision can not be applied here. The doctor and nurse, it seems to us, should be provided for as well as the hospital Under this bill, a person meeting with an automobile injury is defined as an indigent. This differs very widely from our general definition of an indigent. Only public hospitals are concerned and the Commissioner of Health is to furnish the Commissioner of Motor Vehicles and the Comptroller a list of such hospitals with their per diem cost for care The injured person, in order to receive the benefit of this law, must "assign and set over unto the hospital in which he is treated, to the extent of the amount for the reasonable charge of such hospital, in an amount not to exceed $6 00 per diem for such treatment, care and maintenance, any rights of action, suits, claims or counterclaims which he may have." * The hospital is obliged to file monthly statements with the Commissioner of Motor Vehicles of patients treated under this act. The Commissioner of Motor Vehicles shall pay all claims

Assembly Int. 496—Burgdorf, authorizes the State Health Commissioner to permit the discharge of sewage, chemicals, refuse or waste matter into State waters by any factory or industrial establishment if the Commissioner finds such discharge will not pollute the waters in a manner injurious to health or so as to create a public nuisance. Referred to the Health Committee.

Assembly Int. 556—Holley, creates in the State Health Department a consumers' bureau for registration, advertising control, analysis, scientific research, education and publicity of, manufacture and sale of drugs, cosmetics or health devices Referred to the Health Committee

Comment With a few minor changes, this bill is identical with Assembly Int 364—Brenner

Bulletin No 4

January 31, 1938

We are wondering how thoroughly our bulletins are being read As with radio performers, we have no way of satisfying ourselves on this point except by the comments we receive which we can relate to something appearing in one of them, and frequently our "fan mail" is not as heavy as we should like to see it. Finally we endeavor to take a position on the bills that we think the Society would approve and our object in sending out the bulletins is to secure support from as broad a base as possible. You may agree with our comment and, if you do, a line to that effect will satisfy us If you do not agree, then we wish you would send us a statement of your objection and your reason. It may be that you will point to something that we overlooked. If our comment is not clear on any bill, we will be glad to go into detail, or if you would prefer to read a copy of the printed bill, we shall send it to you upon request. Dear bulletin reader, this applies to you Don't think that you do not need to write because another will, we want comments from all

New Bills Introduced

Senate Int. 326—Fischel, health insurance, same as Assembly Int. 35—Wagner With the Senate Labor Committee

Senate Int. 327—Fischel, health insurance, appointment of commission, same as Assembly Int. 34—Wagner With the Senate Finance Committee.

Senate Int. 459—Crawford, sanitary regulation of trailers and tourist camps, same as Assembly Int. 358—Ostertag With the Senate Health Committee.

Senate Int. 481—Schwartzwald, relative to pollution of waters, same as Assembly Int. 496—Burgdorf With the Senate Health Committee.

Senate Int. 482—Schwartzwald, regulations of Public Health Council, same as Assembly Int. 397—Burgdorf With the Senate Health Committee

Senate Int. 483—Schwartzwald, liability for damages of certain State employees, same as Assembly Int. 398—Burgdorf. With the Senate Health Committee.

Senate Int. 526—Feld, provides for license of registered and practical nurses by board of not less than seven members appointed by the Regents, and makes general rules and regulations therefor Referred to the Education Committee.

Comment Same as Senate bill Int. 187, by Mr Esquirol, except that in this bill the name of the second group of nurses is changed from "nursing aide" to "practical nurse" and subsection (e) of section 1378, which refers to schools established for the training of nursing aides, is deleted.

Assembly Int 623—Fogarty, provides for arbitration as to value of medical aid rendered under the Workmen's Compensation Law, by two physicians designated by injured person or his physician, instead of president of county medical society Referred to the Labor Committee.

Comment The Workmen's Compensation Law at present provides for the creation of arbitration committees by the county societies The president of each county society has authority to appoint two physicians to the arbitration board This bill would remove that authority and place it with the injured person or the injured per-

Comment The bureau shall be operated by a director appointed by the Governor, and a committee on public health of five members, appointed by the Governor The committee shall investigate scientific problems relating to tolerances for poisonous ingredients and allergy or susceptibility Every manufacturer or proprietor of a proprietary product sold in this State shall register it and procure a numbered certificate, for which a fee of $25 00 shall be paid, and $10 00 for annual renewal Every applicant for a certificate of registration shall submit (1) The true and complete qualitative and quantitative composition or formula of the product sought to be registered, (2) The exact text of every judgment, decree, order or stipulation relating to such product entered or issued by any court, federal trade commission or other governmental agency, (3) "A statement of all the therapeutic, palliative or other beneficial effects claimed or to be claimed for such product in its sale, together with satisfactory evidence or authority in support of such claim", (4) Names of those under whose supervision the product is manufactured Certificates shall be denied (1) If accompanied by a false or misleading statement, (2) Contains poisonous or deleterious substance, (3) Contains any ingredient in excess of that determined as safe, (4) If applicant makes claim for the product which can not be supported by scientific or medical opinion, (5) Adulteration, (6) Product is not manufactured under proper supervision No appropriation is provided, for it is believed that the bureau can support itself on registration fees collected.

Assembly Int. 380—McCaffrey, strikes out provision that physician in workmen's compensation cases, as employee or carrier may select and pay for, may participate in examination if employee or carrier so requests Referred to the Labor Committee.

Assembly Int 381—Methfessel, requires not more than twenty days preceding application for marriage license, examination of parties by a physician who must make a written report stating whether he finds person examined is suffering from gonorrhea or syphilis, or epilepsy, heart disease, tuberculosis or other infectious disease, copy to be mailed to the other party to marriage, and relative to duties of town or city clerks in connection therewith Referred to the Judiciary Committee

Comment The bill specifically states that the confidential relationship between patient and physician shall be waived for the purpose of making this report, and the physician shall be held free from libel or slander because of any statement contained in the report, and also that the "physician who wilfully conceals or fails to state in such report the existence of one or more of the diseases above mentioned, shall be guilty of a misdemeanor" It further provides that "a marriage is void from the time its nullity is declared by a court of competent jurisdiction if either party thereto is, at the time of the marriage, suffering from gonorrhea or syphilis in the infectious or transmissible stages"

Assembly Int 397—Burgdorf, requires that regulations of the Public Health Council for qualifications for certain public employees whose duties pertain to enforcement of Sanitary Code, be incorporated in such Code. Referred to the Health Committee.

Assembly Int. 398—Burgdorf, provides that commissioner, deputy commissioner, assistant commissioner or physician employee of the State Health Department shall not be liable for damages because of official acts, and permits claims for damages to be brought in Court of Claims Referred to the Health Committee

Assembly Int. 435—Flynn, prohibits person from negotiating within fifteen days after accident for a settlement or obtain general release or statement from person sustaining personal injuries Referred to the Codes Committee.

Assembly Int. 436—Flynn, prohibits person from negotiating within fifteen days after accident, a settlement or obtaining release or statement with reference to injury, from a person confined in hospital or sanitarium Referred to the Codes Committee.

Assembly Int 439—Garcia-Rivera, provides home relief recipients shall receive not less than $10 00 a week each and not less than $3 00 for each dependent, and there shall be adequate allowance for rent, special diet, food, medical care, clothing, and household incidentals, persons living apart from family shall not be compelled to live with his family in order to receive relief Referred to the Relief and Welfare Committee.

Assembly Int. 492—Suitor, provides for care of indigent persons suffering from motor vehicle injuries in hospitals not organized for profit and registered by the State Health Department, per diem cost not to exceed $6 00, and appropriates $350,000 Referred to the Ways and Means Committee

Comment This is the third year that Mr Suitor has carried this bill The comment that was made on it last year can be repeated It is framed along the lines of an Ohio law Conditions under which hospitals are financed differ so much in the

with our upstate members during the many meetings the Committee held and our progress thus far [May 25, 1937] is chiefly a result of the efforts of members who are residents of New York City However, our work is not yet completed and we are quite certain that our upstate members will have the opportunity, as well as the responsibility of assisting in the completition of this work

You must understand that our official report, when made, must go to Committee of which we are a constituent part and what we have to say this morning is only in the nature of a summary of our efforts thus far, so that you may be advised as to the direction it is taking and so be in a position to offer us further suggestions

We desire first to call your attention to the fact that for the year 1936 more than fifty per cent of the cases of industrial diseases handled under the Workmen's Compensation Law were diseases of the skin This fact, it seemed to our Commitee, justified our intention to ask our State Society to set up, under the Workmen's Compensation Committee a standing Sub-committee on Industrial Dermatoses We trust that the Recommendation will be accepted. Based on our experience with compensable dermatoses in New York City the Committee was impressed with the regularity with which alleged compensable dermatoses found their way to the Referee of the Labor Board with conflicting dermatologic opinions on their etiology It was this fact that formed the background for several distinct topics of investigation that the Committee undertook

It was realized that in practice the Referee of the Labor Board, a layman, was called upon in many instances to select from conflicting medical opinions a point of view on which to render a decision This we thought placed an unfair burden on the Referee and saddled him with a duty that, in the last analysis, was purely medical, namely, the making of an etiological diagnosis Our Committee therefore has been studying the feasibility of setting up a board of dermatologic specialists who could act in an advisory capacity to resolve such disputed cases The nature, function, and machinery for the activity of this board is still receiving our attention As a corollary which follows from the above mentioned difficulty, it was found advisable to set up, for purposes of guidance to physicians, a series of generally accepted dermatologic concepts applicable to industrial dermatoses, that may guide physicians in their study and analysis of such cases of industrial dermatoses as come under their care Such concepts the Committee was pleased to call the criteria for the diagnosis of industrial dermatoses These criteria, among other things include an evaluation of the trichophytin test and the patch test

Equally as important as these diagnostic criteria is the matter of the adequate interpretation of the term "cure." We must confess that we have not as yet hit upon an adequate and satisfactory definition from the point of view of its legal applicability You will recall that tied up with the solution of this question is the matter of induced hypersensitivity and the consequences that may ensue therefrom

Lastly, the Committee gave serious consideration to the fact that the practice of industrial medicine necessitated, for varying periods of time, contingency fee service, by virtue of the fact that the law specifically requires the treating physician, on suspecting a compensable disease, to refrain from accepting fees from the employee. Since some employees represent a doubtful credit risk and since a considerable period of time elapses between a physician's judgment as to compensability of a case and the authoritative acceptance thereof, the physician often finds himself in the position of unsuccessfully seeking payment from the employee when compensability is ultimately denied In connection with this problem we are seeking a way to minimize the amount of contingency fee service that must necessarily prevail

In closing we wish to acknowledge the kind cooperation of Mr Siegel, Referee of the Labor Board in New York City district in charge of skin disease cases, and also that of Dr Kaliski, Chairman of our Workmen's Compensation Committee. We trust that our continued efforts will eventuate in ultimate arrangements for a more useful and serviceable practice of our specialty under the Workmen's Compensation Law

---

The New York City Department of Hospitals, in its twenty-six institutions, utilizes the services of approximately ten per cent of all interns in the United States

son's physician, and would also change the language of the bill to read that these physicians are to be members of the Medical Society of the State of New York

Assembly Int. 648—Fite, requires city or town in which mother is resident, to pay $75 00 towards expense in child-bearing for hospital, nursing, and medical services, State to pay one-half Referred to the Cities Committee

Comment The subsidy is to apply whether the child is born at home or in a hospital, "provided that pre-natal care shall have been given commencing with the fourth month of the enceinte" Payments are to "be made in all cases except when expressly rejected by the parents, and shall be in lieu of any benefits or relief for such purposes otherwise provided."

Assembly Int 705—Flynn, provides attorney of patient or former patient of hospital shall be allowed to inspect records relative to care and treatment of such person therein upon presenting written authorization executed and acknowledged by such patient Referred to the Codes Committee.

This bill has not yet been printed Comment will be made in the next bulletin.

Assembly Int 711—Sullivan, provides for license to practice ophthalmic dispensing, defined as the filling or dispensing of ocular prescriptions involving lenses, spectacles, eyeglasses or optical devices or appliances, except drugs and medicines, as prescribed by physicians and optometrists, under State Board hereby created in Education Department Referred to the Education Committee

This bill has not yet been printed Comment will be made in the next bulletin

Action on Bills

At a conference on January 24, the Committee took action on the following bills

Approved

Assembly Int 291—Breitbart—Identification of criminals

Assembly Int. 292—Breitbart—Blood tests in criminal proceedings

Assembly Int 334—Peterson—Intoxicated drivers

Assembly Int 358—Ostertag—Sanitary regulation of trailers, etc.

Assembly Int 364—Brenner-Consumers' bureau, food and drug bill

Opposed

Senate Int. 243—Livingston, Assembly Int. 332—Wagner—Nurse registration.

Senate Int. 268—Hanley, Assembly Int. 344—Canney—Division of foods in Health Department

Senate Int 269—Hanley, Assembly Int. 349—Canney—Division of foods in Labor Department

Senate Int 278—Warner, Assembly Int. 443—Marble—Registration of births

Assembly Int 339—Phelps—Insane patients, future care, etc

COMMITTEE ON WORKMEN'S COMPENSATION

At the 1936 Annual Meeting of the Medical Society of the State of New York, your Chairman [Eugene F Traub, M D], on motion from the floor, appointed a Committee of three to study the newer problems in Industrial Dermatoses, as presented by the amended Workmen's Compensation Law of 1935 When this Committee started to function it was advised by the Secretary of our State Society that our Section had acted without authority in the appointment thereof We were further advised that the problem of the Industrial Dermatoses came under a standing Committee of the Society, namely the Workmen's Compensation Committee Our State Secretary, on consultation with the Chairman of the said Workmen's Compensation Committee, realized the necessity for the investigation we proposed to undertake and accepted the motion herein passed last year as indicative of the need for a Sub-committee of our State Workmen's Compensation Committee, to deal specifically with the question of industrial dermatoses

The Chairman of the Workmen's Compensation Committee therefore appointed the following Committee covering all parts of the state

Eugene F Traub, *Chairman*	New York City
Herman Sharlit, *Secretary*	New York City
Howard Fox	New York City
J Gardner Hopkins	New York City
Beatrice Kesten	New York City
Oscar Levin	New York City
Marion Sulzberger	New York City
Louis Tulipan	New York City
John C Graham	Brooklyn
Albert R. McFarland	Rochester
G M Fisher	Utica
Earl D Osborne	Buffalo
Mark Heiman	Syracuse

Unfortunately it was not feasible to meet

SPECIALIZATION

The certification of medical specialists and the control of specialization in the future as the major concern of the medical profession today was brought out on January 29 at the Hotel Biltmore in New York City by some of the leaders in the movement who outlined the program which the profession has set up for the benefit of the general public as well as for its own protection

The occasion was the annual banquet of the Faculty Association of the New York Post-Graduate Medical School and Hospital which was attended by several hundred guests and members of the professional staffs of the Post-Graduate, the Reconstruction, and the Skin and Cancer hospitals which comprise the postgraduate teaching group of Columbia University

By 1940 no one will be able to represent himself as a specialist without the certification of one of twelve national boards, representing the principle medical specialites, which are now working under the American Medical Association All of the state or national medical directories will indicate to an inquiring public those men who have qualified as specialists in their particular fields Already hospitals and other medical institutions are refusing to give appointments to specialists unless they are diplomates of their national specialty boards and later, when the entire medical profession is well-acquainted with these boards, general practitioners will cease to refer patients and the patient will refuse to be treated by uncertified specialists

Need for Control

Speaking of the origin and background of the national specialty examining boards, Dr Walter T Dannreuther, President of the American Board of Obstetrics and Gynecology said, "After the turn of the century the medical profession became afflicted with numberless self-styled specialists and there were no criteria whereby those who were well qualified could be distinguished from those who were not. The rapid multiplication of self-appointed specialists was encouraged by the tendency of the public to ask who was a specialist rather than to inquire what a specialist is The term specialist carries with it an implication of superior training and a background of extensive clinical experience and no physician is warranted in posing as a specialist unless he is really expert in his chosen field The essential skill can be acquired only by extensive study, prolonged training, and wide experience. The public has a right to expect the medical profession to safeguard it from 'mushroom' specialists"

Program Outlined

Dr Willard C Rappleye, President of the Advisory Board for Medical Specialties, and dean of the College of Physicians and Surgeons of Columbia University, in describing the program which is now well under way said 'In response to the needs of the public and the profession the various specialty groups in the country have banded together and organized twelve American Boards whose primary function is to improve the quality of training in each of the specialties and to provide for the public a device which will permit the profession and the public to recognize those men who are experts These twelve boards are coordinated under the Advisory Board for Medical Specialties which, in addition to the professional groups, represents the American Hospital Association, the Association of American Medical Colleges, the National Board of Medical Examiners, and the Federation of State Medical Boards of the United States The Advisory Board is probably the most representative body in the field of medical education which now exists in the country"

The efforts of the specialty boards and the Advisory Board are in direct response to the need in every area of the country of an adequate number of specialists who, in addition to a sound basic preparation in medicine, are qualified by graduate training, technical skill, judgment, and experience to perform the specialized service which some patients require Opportunities for advanced training must be made available because the usual medical course and internship can provide a student with only the elementary and introductory principles of medicine The mass of scientific knowledge and the variety of skills needed in all divisions of practice are far too extensive to be covered satisfactorily in the usual medical course The public and the profession are confused by the large number of physicians who claim to be specialists whereas in reality there is a shortage of fully trained experts to meet the needs of the country

"Not only are the specialty boards interested in the proper training of specialists but equally so in making available to the public through a register of specialists the

PNEUMONIA CONTROL

That the physicians of the State may have concrete examples of different phases of anti-pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti pneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Case 12

Case report from the records of Dr Frederic F Drury, Gouverneur

"J H, a nineteen year old male had been perfectly well except for slight 'cold' of three days' duration when he had onset of dyspnea, sudden fever, and a cough slightly productive of blood-stained sputum on December twelve, nineteen hundred and thirty-seven He felt moderately ill His temperature was 103.2, pulse 108, and respirations twenty-eight That night he called his physician who found dullness and bronchial breathing over the lower half of the right chest posteriorly A sputum specimen was sent to the laboratory and on the following morning, the second day of the disease, a report of Type V pneumococci was received Serum administration was begun promptly and four therapeutic doses of New York State Type V antipneumococcus serum were given in twenty c.c. amounts at about four hour intervals No serum reactions occurred The temperature and pulse began to drop by crisis after the second dose had been administered, and at 8 A M on the third day of the disease, the temperature was 98, pulse eighty, and the respiratory rate had returned to normal Convalescence was uneventful, and the patient was discharged well on December thirty, on the eighteenth day of his disease"

The treatment of Type V pneumonia by specific Type V antipneumococcus horse serum is now well-established. The published reports of Finland and Bullowa show it to be unquestionably effective when properly used The case cited above is a typical favorable response to this type of serum

Since no standard therapeutic unit has as yet been adopted for Type V serum by either New York State or the Federal Government, there is no designation of the number of units in the vial on its label.

In general, the principles underlying Type V serum therapy are similar to those for Type I The limited available evidence indicates that dosage *in number of vials* as supplied by the New York State Department of Health is reasonably identical for both types An uncomplicated early case may be given a minimum dose of two vials and an average dose of four vials Bacteremic cases as indicated by a blood culture taken just prior to the first intravenous dose of serum require at least double the dose. Late cases, aged patients, and cases with extensive pulmonary involvement need more serum than uncomplicated cases

The usual precautions against horse serum sensitivity should be carried out (including history, skin and eye tests, and a preliminary intravenous test of ten c.c. of a 1 10 dilution of serum) A syringe containing one c c of 1 1,000 epinephrin should be at hand throughout the whole procedure.

Each dose should consist of two vials and the interval between doses should not exceed four hours Once serum therapy is started, its administration at regular intervals should be kept up until the desired effect is obtained, or cause for failure determined

In the event that the patient does not respond after four vials have been administered, the blood culture should be repeated, sputum rechecked for error or mixed infection, and a careful search made for localized foci of infection such as empyema, thrombophlebitis, meningitis, pericarditis, endocarditis or otitis media

---

In Persia in the eleventh century, a secret society was organized for the purpose of murder The members of this group found that the best way to accomplish this was to fill themselves up with Indian hemp, or hashish (Marijuana) Because of this custom they were called "hashishins," which we have shortened to assassins —*Clinical Medicine and Surgery*

A hospital on wheels will be added to San Francisco's public health service, if plans of Dr J C Geiger, city health officer, are approved by the Board of Supervisors The hospital would include a trailer to an ambulance, completely equipped for emergency work with an operating table, two beds, and surgical instruments

THE PHYSICIAN'S INCOME TAX—1938

Prepared by the Bureau of Legal Medicine and Legislation

This discussion relates only to the requirements of the federal income tax law Information with respect to the requirements of state income tax laws should be obtained from responsible state sources

The Revenue Act of 1936 amended in numerous respects the prior income tax law, but none of the changes made relate to physicians as a class distinct from the main body of federal income tax payers

Every one who is required to make a federal income tax return must do so on or before March 15, unless an extension of time for filing his return has been granted For cause shown, the collector of internal revenue for the district in which the taxpayer files his return may grant such an extension, on application filed with him by the taxpayer This application must state fully the causes for the delay Failure to make a return may subject the taxpayer to a penalty of 25 per cent of the amount of the tax due.

The normal rate of tax on residents of the United States and on all citizens of the United States regardless of their places of residence is 4 per cent on net income in excess of the exemptions and credits

Who Must File Returns

1 If gross income was less than $5,000 during 1937, a return must be filed (*a*) by every unmarried person, and by every married person not living with her husband or his wife, whose net income was $1,000 or more, and (*b*) by every married person living with her husband or his wife, whose net income was $2,500 or more If the aggregate net income of husband and wife, living together, was $2,500 or more, each may make a return or the two may unite in a joint return.

2 Returns must be filed by every person whose gross income in 1937 was $5,000 or more, regardless of the amount of his net income and of his marital status If the aggregate gross income of husband and wife, living together, was $5,000 or more, they must file either a joint return or separate returns, regardless of the amounts of their joint or individual net incomes

If the status of a taxpayer, so far as it affects the personal exemption or credit for dependents, changed during the year, the personal exemption and credit must be apportioned, under rules and regulations prescribed by the Commissioner of Internal Revenue with the approval of the Secretary of the Treasury, in accordance with the number of months before and after such change For the purpose of such apportionment a fractional part of a month should be disregarded unless it amounts to more than half a month in which case it is to be considered as a month.

As a matter of courtesy only, blanks for returns are sent to taxpayers by the collectors of internal revenue, without request Failure to receive a blank does not excuse any one from making a return, the taxpayer should obtain the necessary blank from the local collector of internal revenue.

The following discussion covers only matters relating specifically to physicians Full information concerning questions of general interest may be obtained from the official return blank and from the collectors of internal revenue.

Gross and Net Incomes What They Are

Gross Income A physician's gross income is the total amount of money received by him during the year for professional services, regardless of the time when the services were rendered for which the money was paid, plus such money as he has received as profits from investments and speculation and as compensation and profits from other sources

Net Income Certain professional expenses and the expenses of carrying on any enterprise in which the physician may be engaged for gain may be subtracted as "deductions" from the gross income, to determine the net income on which the tax is to be paid An "exemption" is allowed, the amount depending on the taxpayer's marital status during the tax year as stated before. These matters are fully covered in the instructions on the tax return blanks

Earned Income In computing the normal tax, but not the surtax, there may be subtracted from net income from all sources an amount equal to 10 per cent of the earned net income, except that the amount so subtracted shall in no case exceed 10 per cent of the net income from all sources Earned income means professional fees, salaries and wages received as compensation for personal services, as distinguished from receipts from other sources

Reprinted from the *Journal of the American Medical Asso*, January 29, 1938

names of those physicians who are certified by the Boards as fully competent in their individual fields of practice While the specialty boards and the Advisory Board are primarily concerned with training in the clinical specialties they are aware of and are endeavoring in every possible way to strengthen the education programs which will benefit those physicians commonly designated as general practitioners who today are, and there is every indication that they will remain in the future, the backbone of medical service for the entire country," said Dr Rappleye

Functioning of Specialty Board

Dr Clarence G Bandler, Vice-President of the American Board of Urology, and recently elected President of the New York County Medical Society, described the activities of the boards all of which are similar in operation "Nine members are elected for five-year terms, three each by the two national associations and three by the specialty section of the American Medical Association The boards are not self-perpetuating, but replacements may be made by the cooperating bodies every five years Their first objective being to insure the competency of any physician or surgeon who is specializing, it becomes the function of the boards, after the credentials of applicants are thoroughly investigated, to conduct written, oral, and practical examinations testing the qualifications of volunteer candidates"

State's Demand for License Anticipated

"The states for some time have been discussing the advisability of having a special license for medical specialties," said Dr George Miller Mac Kee, of the American Board of Dermatology and Syphilology, and chief of the Skin and Cancer Unit of the Post-Graduate. "If the states do demand a license it is hoped they will accept the certificates issued by the boards instead of holding their own examinations. This hope is based on the belief that the board composed of dermatologists, for instance, is better qualified to pass on the credentials of a dermatological candidate than is a state board where there might be political influence"

Dr Adolph G De Sanctis, President of the Faculty Association, presided at the dinner and in introducing the speakers commented with pride on the fact that so many of the staff of the New York Post-Graduate Medical School and Hospital represented the profession on the various national specialty boards, also that the institution had taken such an active and leading part in graduate medical education and the control of specialization as well as in organized medicine Referring to the statement that what the young medical graduate needs today is additional clinical training, he said "I have felt for some time that practically all the emphasis in medical education has been in the undergraduate field, and today in the United States we can boast of undergraduate medicine which is second to none in the entire world, but I believe that the pendulum has swung too far in one direction and I, for one, believe that too much emphasis has been placed on the scientific and too little on the clinical phase of medicine."

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

The general oral, clinical and pathological examinations for all candidates (Groups A and B) will be conducted by the entire Board, meeting in San Francisco, on June 13 and 14, immediately prior to the meeting of the American Medical Association

Application for admission to the June 1938 Group A examinations must be on an official application form and filed in the Secretary's Office before April 1

The annual informal Dinner and General Meeting of the Board will be held at the Palace Hotel, San Francisco, on June 15, at seven o'clock Dr William D Cutter, Secretary of the Council on Medical Education and Hospitals of the American Medical Association will be the guest speaker, and the Diplomates certified at the preceding days' examinations will be introduced individually All Diplomates are invited to attend the dinner meeting, and to bring as guests their wives and any persons interested in the work of the Board

For further information and application blanks address Dr Paul Titus, Secretary, 1015 Highland Building, Pittsburgh, Pa

---

Mayor Charles W Kress, of Binghamton, is urging the construction of an addition to the City Hospital, which is badly overcrowded.

28, 1934, No 4422, it is held, among other things, that

1 The cost to be recovered shall be charged off over the useful life of the property

2 The reasonableness of any claim for depreciation shall be determined on the conditions known to exist at the end of the period for which the return was made.

3 Where the cost or other basis of the property has been recovered through depreciation or other allowances, no further deduction for depreciation shall be allowed.

4 The burden of proof will rest on the taxpayer to sustain the deduction claimed

5 The deduction for depreciation in respect to any depreciable property for any taxable year shall be limited to such ratable amount as may reasonably be considered necessary to recover during the remaining life of the property the unrecovered cost or other basis

Particular attention is called to the last of the foregoing provisions If, in prior years, rates have been claimed which, if continued, will fully depreciate the cost, less salvage, before the end of its useful life, based on conditions now known, a reestimate of the remaining useful life should now be made and the portion of the cost that had not been depreciated at the beginning of the year 1937 (for a return for the year 1937) should be spread over this reestimated life.

Medical Dues Dues paid to societies of a strictly professional character are deductible. Dues paid to social organizations, even though their membership is limited to physicians, are personal expenses and not deductible

Postgraduate Study The Commissioner of Internal Revenue holds that the expenses of postgraduate study is not deductible.

Traveling Expenses Traveling expenses, including amounts paid for transportation, meals and lodging, necessarily incurred in professional visits to patients and in attending medical meetings for a professional purpose, are deductible

Automobiles Payment for an automobile is a payment for permanent equipment and is not deductible The cost of operation and repair, and loss through depreciation, are deductible The cost of operation and repair includes the cost of gasoline, oil, tires, insurance, repairs, garage rental (when the garage is not owned by the physician), chauffeurs' wages, and the like

Deductible loss through depreciation of an automobile is the actual diminution in value resulting from obsolescence and use and from accidental injury against which the physician is not insured. If depreciation is computed on the basis of the average loss during a series of years, the series must extend over the entire estimated life of the car, not merely over the period in which the car is in the possession of the present taxpayer

If an automobile is used for professional and also for personal purposes—as when used by the physician partly for recreation, or so used by his family—only so much of the expense as arises out of the use for professional purposes may be deducted. A physician doing an exclusive office practice and using his car merely to go to and from his office cannot deduct depreciation or operating expenses, he is regarded as using his car for his personal convenience and not as a means of gaining a livelihood

What has been said in respect to automobiles applies with equal force to horses and vehicles and the equipment incident to their use

Miscellaneous

Contributions to Charitable Organizations For detailed information with respect to the deductibility of charitable contributions generally, physicians should consult the official return blank or obtain information from the collectors of internal revenue or from other reliable sources A physician may not, however, deduct as a charitable contribution the value of services rendered an organization operated for charitable purposes

Laboratory Expenses The deductibility of the expenses of establishing and maintaining laboratories is determined by the same principles that determine the deductibility of corresponding professional expenses Laboratory rental and the expenses of laboratory equipment and supplies and of laboratory assistants are deductible when under corresponding circumstances they would be deductible if they related to a physician's office

Losses by Fire or Other Causes Loss of and damage to a physician's equipment by fire, theft or other cause, not compensated by insurance or otherwise recoverable, may be computed as a business expense and is deductible, provided evidence of such loss or damage can be produced Such loss or damage is deductible, however only to the extent to which it has not been made good by repair and the cost of repair claimed as a deduction

Insurance Premiums Premiums paid for insurance against professional losses are deductible This includes insurance against damages for alleged malpractice, against liability for injuries by a physician's automo-

The first $3,000 of a physician's net income from all sources may be regarded under the law as earned net income, whether it was or was not in fact earned within the meaning set forth in the preceding paragraph Net income in excess of $3,000 may not be claimed as earned unless it in fact comes within that category No physician may claim as earned net income any income in excess of $14,000

Deductions for Professional Expenses

A physician is entitled to deduct all current expenses necessary in carrying on his practice The taxpayer should make no claim for the deduction of expenses unless he is prepared to prove the expenditure by competent evidence So far as practicable, accurate itemized records should be kept of expenses and substantiating evidence should be carefully preserved The following statement shows what such deductible expenses are and how they are to be computed

Office Rent Office rent is deductible If a physician rents an office for professional purposes alone, the entire rent may be deducted If he rents a building or apartment for use as a residence as well as for office purposes, he may deduct a part of the rental fairly proportionate to the amount of space used for professional purposes If the physician occasionally sees a patient in his dwelling house or apartment, he may not, however, deduct any part of the rent of such house or apartment as professional expense, to entitle him to such a deduction he must have an office there, with regular office hours If a physician owns the building in which his office is located, he cannot charge himself with "rent" and deduct the amount so charged

Office Maintenance Expenditures for office maintenance, as for heating, lighting, telephone service and the services of attendants, are deductible

Supplies Payments for supplies for professional use are deductible. Supplies may be fairly described as articles consumed in the using, for instance, dressings, clinical thermometers, drugs and chemicals Professional journals may be classified as supplies, and the subscription price deducted Amounts currently expended for books, furniture and professional instruments and equipment, "the useful life of which is short," generally less than one year, may be deducted, but if such articles have a more or less permanent value, their purchase price is a capital expenditure and is not deductible

Equipment Equipment comprises property of a more or less permanent nature. It may ultimately wear out, deteriorate or become obsolete, but it is not in the ordinary sense of the word "consumed in the using"

The cost of equipment, such as is described above, for professional use, cannot be deducted as expense in the year acquired. Examples of this class of property are automobiles, office furniture, medical, surgical and laboratory equipment of more or less permanent nature, and instruments and appliances constituting a part of the physician's professional outfit, to be used over a considerable period of time, generally over one year Books of more or less permanent nature are regarded as equipment and the purchase price is therefore not deductible.

Although the cost of such equipment is not deductible in the year acquired, nevertheless it may be recovered through depreciation deductions taken year by year over its useful life, as described below

No hard and fast rule can be laid down as to what part of the cost of equipment is deductible each year as depreciation The amount depends to some extent on the nature of the property and on the extent and character of its use. The length of its useful life should be the primary consideration The most that can be done is to suggest certain average or normal rates of depreciation for each of several classes of articles and to leave to the taxpayer the modification of the suggested rates as the circumstances of his particular case may dictate As fair, normal or average rates of depreciation, the following have been suggested automobiles, 25 per cent a year, ordinary medical libraries, x-ray equipment, physical therapy equipment, electrical sterilizers, surgical instruments and diagnostic apparatus, 10 per cent a year, office furniture, 5 per cent a year

The principle governing the determination of all rates of depreciation is that the total amount claimed by the taxpayer as depreciation during the life of the article, plus the salvage value of the article at the end of its useful life, shall not be greater than its purchase price or, if purchased before March 1913, either its fair market value as of that date or its original cost, whichever may be greater The physician must in good faith use his best judgment and claim only such allowance for depreciation as the facts justify The estimate of useful life, on which the rate of depreciation is based, should be carefully considered in his individual case

In a Treasury Decision, approved Feb

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

AN EXECUTIVE BOARD MEETING of the Woman's Auxiliary to the Medical Society of the State of New York was held on February 10, at the home of the President, Mrs Francis R. Irving, 119 Wendall Terrace, Syracuse. The Executive Board members of Syracuse had invited the visiting members to be their house guests

Following the Board Meeting the members were guests of Mrs Carlton F Potter at a buffet supper at her home

ON FEBRUARY 1, the Onondaga County Auxiliary held its regular meeting at the Crouse Irving Hospital Dr Joseph Lawrence of Albany spoke on Legislation Mrs Katherine Scott Sykes presented an original skit. Tea and a social hour followed.

THE WOMAN'S AUXILIARY of Schenectady County held a regular meeting at the Ellis Hospital in the Doctors Auditorium on January 25 This meeting marked the first anniversary of the organization

THE PRESIDENT, Mrs Francis Irving and the Organization Chairman, Mrs John J Buettner attended a meeting of Oswego County women on January 17, at the home of Mrs Kent Wood Jarvis, wife of the President of the Oswego County Medical Society Twenty-nine members were present. It was voted to organize an Auxiliary Mrs John J Brennan was elected temporary Chairman A delightful tea followed the transaction of business

THIRTY-FIVE WOMEN signed the Secretary's book as charter members of the Woman's Auxiliary to the Jefferson County Medical Society at a dinner meeting held at the Black River Valley Club on November 11 Mrs Irving, President of the State Auxiliary, and Mrs John Buettner, Organization Chairman, were present and spoke of the purpose of the Auxiliary Dr Charles Prudhon, Secretary of the Jefferson County Medical Society addressed the meeting on the need for such an organization

The Need of a Woman's Auxiliary in Every County Medical Society

THE QUESTION SO OFTEN ASKED in many County Medical Societies Is there a need for an Auxiliary to our Society?

The best answer may be gathered from those societies which have been fortunate enough to have one. The foremost consideration in the minds of those promoting this organization was its social value within the medical profession itself Some of the leaders in the State Medical Association have said that since there are forces within this profession as well as without, which are working against its best interests, the time has come when much thought should be given in bringing about unity and solidity in the profession Because the social instinct is, generally speaking, more highly developed in women than in men, they have felt that doctor's wives can perform a distinct service to the medical profession by helping to develop unity through fellowship between members of the doctor's families

The Auxiliary, besides fulfilling this work for which it was started, has done very constructive work in furthering the maternal welfare, syphilis, and cancer clinics It has been found of great value in Legislative matters pertaining to medicine.

Another thing that has been said by State Secretaries is that the Women's Annual State Meetings, which are held at the same time as the medical meetings, serve to interest the wives and to bring out a much larger attendance than formerly among the membership The usefulness of the Auxiliary in the entertainment of the wives of visiting physicians, not only at the state meeting but other medical meetings of all sorts, is obvious

While there is no outstanding increase in organization, there is an indication of steady growth, not only in membership but in an increased interest in the principles of the Auxiliary, which is very gratifying

Increase in membership may be made by the Membership Chairman of each County enlisting new members in the Auxiliary already organized and also to encourage the wives of doctors in Counties having no Auxiliary to have one formed.

bile while in use for professional purposes, and against loss from theft of professional equipment and damage to or loss of professional equipment by fire or otherwise. Under professional equipment is to be included any automobile belonging to the physician and used for strictly professional purposes

Expense in Defending Malpractice Suits Expense incurred in the defense of a suit for malpractice is deductible as a business expense

Sale of Spectacles Oculists who furnish spectacles, etc., may charge as income money received from such sales and deduct as an expense the cost of the article sold. Entries on the physician's account books should in such cases show charges for services separate and apart from charges for spectacles, etc.

For the convenience of physicians, a Notary Public is always available at the Editorial Offices of the NEW YORK STATE JOURNAL OF MEDICINE, 33 W 42 St., New York City

AMERICAN BOARD OF OPHTHALMOLOGY

The American Board of Ophthalmology announces that it will hold examinations in San Francisco, June 13, during the American Medical Association, in Washington, D C, October 8, during the American Academy of O and O L, and in Oklahoma City, November 14, during the Southern Medical Association

Applications should be filed immediately, as the required number of case reports must be filed at least sixty days prior to date of examination. Application blanks can be procured from Dr John Green, 3720 Washington Ave, St Louis, Mo

Up to the end of 1937, the Board held fifty-six examinations and had certified 1,498 ophthalmologists The Board on January 1, 1938, issued a new and complete list of physicians certificated to date, arranged geographically This list was mailed gratis to all certificated persons and to over two hundred and fifty hospitals and institutions

During 1937, examinations were held at Los Angeles on January 23, at Philadelphia on June 7, and at Chicago on October 8-9 At these examinations twenty-five, seventy-one, and eighty-four candidates respectively were examined, of whom nineteen, forty-two, and fifty-six respectively were passed, three, seventeen, and twenty-five respectively were conditioned, and three, two, and one respectively failed.

The American Board of Ophthalmology has established a Preparatory Group of prospective candidates for its certificate. The purpose of this Group is to furnish such information and advice to physicians who are studying or about to study ophthalmology as may render them acceptable for examination and certification after they have fulfilled the necessary requirements Any graduate or undergraduate of an approved medical school may make application for membership in this Group Upon acceptance of the application, information will be sent concerning the ethical and educational requirements, and advice to members of the Group will be available through preceptors who are members or associates of the Board Members of the Group will be required to submit annually a summarized record of their activities

The fee for membership in the Preparatory Group is ten dollars, but this amount will be deducted from the fifty dollars ultimately required of every candidate for examination and certification. For sufficient reason, a member of the Preparatory Group may be dropped by vote of the Board

The American Physicians' Art Association, a national organization of medical men who have ability in the fine arts, will hold a *first national exhibition* in the San Francisco Museum of Art, San Francisco, in June 1938 (The American Medical Association Convention is June 13-17 in the same city) The American Physicians' Art Association already has an outstanding membership There are three classifications for membership active, associate, and contributing The *first annual exhibition* promises to be of unusual interest with entries to be accepted (after jury selection) in the following classifications oils, watercolors, sculpture, photography, pastels, etchings, crayon and pen and ink drawings (including cartoons), wood carvings and book bindings Scientific medical art work will not be accepted The exhibition is not limited to first showings All entries close April 1 Any physician interested should communicate at once with the Secretary of the Association, Flood Bldg, San Francisco

Public Health News

The National Health Survey

J. Rosslyn Earp, L.R.C.P., Dr.P.H.
New York State Department of Health

Medical statisticians have realized for a long time that the picture of social pathology obtained from the analysis of mortality statistics is quite inadequate. Among the attempts that have been made to study the incidence of sickness in a population, those made by Edgar Sydenstricker in the town of Hagerstown, Maryland, are most noteworthy. While these will remain for long a model of precision, their usefulness is limited by the narrow geographical boundaries of the study. When the United States Public Health Service undertook to sponsor and superintend a morbidity survey using the organization and appropriations of the Works Progress Administration, they must have realized that they could not approach the accuracy of Dr. Sydenstricker's work, but that they would be able to obtain a much more adequate sample of the national population. Every precaution was taken to make the results as reliable as could possibly be obtained with the investigators available. The enumerators underwent a special course of training. A vigorous publicity campaign prepared the householders to cooperate so successfully that 98.5 per cent of the families approached were willing to supply the desired information. The medical profession was almost equally obliging. Consent of their patients having been obtained, 535,000 inquiries were mailed to the doctors to confirm the diagnosis of sickness reported. 400,000 answers were received relating to 350,000 attended illnesses.

Altogether, 740,000 urban families and 36,000 rural families are included in the study. The results may be taken as a fair indication of the amount of sickness and medical care found in the economic conditions of 1934 and 1935, during most of which time the medical relief project of the FERA was in operation. The rural population cannot be said to be adequately represented in this study. Only three states—not including New York—undertook rural studies. Undoubtedly, one reason for this, though it is not mentioned in the report, was the difficulty of obtaining travel expenses under a WPA project. The natively Spanish-speaking population of the Southwest which is predominantly rural and which enjoys probably less medical care than any other part of our population, is not represented.

The conclusions reported in the first two bulletins from Washington tend to err, therefore, on the side of understatement. The accompanying table shows the frequency rate of disabling sickness by economic status and the percentage of these cases attended by a physician.

PHYSICIANS' CARE RECEIVED FOR DISABLING ILLNESS AS RELATED TO ANNUAL FAMILY INCOME—2,308,588 PERSONS IN 81 CITIES CANVASSED IN THE NATIONAL HEALTH SURVEY, 1935-1936

Annual family income and relief status	*Frequency rate Annual cases per 1 000 persons*	*Percentage of cases attended by physician*
All incomes	172	74
Relief	234	70
Non-relief		
under $1 000	174	72
$1 000 to $2 000	155	76
$2,000 to $3,000	150	80
$3 000 and over	149	83

This table seems to bear out the opinion expressed in a recent resolution by the trustees of the American Medical Association that "A varying number of people may at times be insufficiently supplied with needed medical service for the maintenance of health and the prevention of disease."

Since these figures for disabling illness relate to illnesses disabling for one week or longer, it will probably be agreed that adequate medical care would include medical care to each of the cases reported. The fact that in families of $3,000 and over income no less than seventeen per cent of cases of disabling illness are unattended by a physician seems to demonstrate that the problem of providing adequate medical care is not only an economic one, a conclusion with which readers of *American Medicine*[1] are already quite familiar.

Of a total of six million persons in the country as a whole estimated to be disabled on the day of the canvass, one and one-half million were found to be suffering from acute respiratory diseases. Two and one-half million were disabled by chronic diseases. About one-half million persons were disabled by injuries due to accident. The acute infectious diseases accounted for a

At present, we have thirteen Counties organized, with an assurance of three more Counties ready to organize

The last County to be organized was Jefferson County, which was organized on November 11, in Watertown, with a charter membership of interested and intelligent women, anxious to begin the work given them by their County Medical Society I have also been asked to meet with a group of Doctor's wives in Oswego County in the very near future

We do not solicit any women against her wishes, but we feel that if she were to experience the joys and privileges of working with this splendid body of women, who are individually and collectively bound to the medical profession by bonds most natural and enduring, she would be anxious to become a member of this group

It is my hope that during the coming year the membership of this organization may be greatly increased. We ought to bear in mind that the wife of every doctor affiliated with the County Medical Association should be a member of this Auxiliary Let it be our goal to see that every such person is a member before the termination of this year

It is not too much to say that our success in matters of importance to us will be substantially in direct proportions to the number and strength of our membership.

It is my earnest desire that each County Society in this State will have an Auxiliary so that they may be represented at the State Convention to be held May 9–12, at the Waldorf-Astoria, New York City

MRS JOHN J BUETTNER
State Organization Chairman

ALUMNI DAY MEDICAL PROGRAM

The New York University College of Medicine announces through James W Smith, M D, Secretary of the Committees on Science, Education, and Entertainment that Alumni Day will be celebrated February 22 The program is as follows

9 45 A.M

Twenty-eighth Street Building,
477 First Avenue

1 Opening remarks by E D Friedman, '07, President Alumni Association

2 Introduction by Albert A. Epstein, '05, Chairman, Committee on Science and Education

10 00 A M

1 "Innervation of the Heart," Donal Sheehan, Professor of Anatomy

2 "Recent Advances in Electrocardiography" Charles E Kossmann, 31, Assistant in Medicine

3 "Pathology of Coronary Occlusion," Irving Graef, Associate Professor of Pathology

4 "Radiographic Studies of the Heart," I Seth Hirsch, Professor of Radiology

5 "Therapeutic Measures in Heart Disease" Arthur C DeGraff, '21, Samuel A Brown Professor of Therapeutics

Demonstrations and Exhibits (Morning and Afternoon) Exhibit of John Wyckoff's work on Heart Disease—Egbert Le Fevre Library, Pathological Demonstrations—Department of Pathology, 4th floor, Roentgenological Exhibit—Department of Radiology, Basement floor, Motion Pictures—Lecture Hall, 3rd floor, Electrocardiographic Exhibit—Loomis Laboratory, 414 East 26 Street.

Luncheon—1 00 P M

Student Lounge, 338 East 26 Street
at First Avenue

Addresses of Welcome Dean Emeritus Samuel A Brown, '94, Dean Currier McEwen, '26, Chancellor Harry Woodburn Chase, Harold O Voorhis, Secretary of the University

3 00 P M

Twenty-eighth Street Building,
477 First Avenue

6 "A Review of John Wyckoff's Contribution to the Study of Heart Disease," Alfred E Cohn, Rockefeller Institute for Medical Research

7 "Rheumatic Heart Disease," Currier McEwen, '26, Assistant Professor of Medicine.

8 "Degenerative Types of Heart Disease," William Goldring, '22, Assistant Professor of Medicine.

9 "Syphilitic Heart Disease," Clarence E de la Chapelle, '22, Assistant Professor of Medicine.

5 00 P M

Social Hours with Dean McEwen Dean's office, Twenty-eighth Street building

Public Health News

The National Health Survey

J Rosslyn Earp, L R C P , Dr P.H.
New York State Department of Health

Medical statisticians have realized for a long time that the picture of social pathology obtained from the analysis of mortality statistics is quite inadequate. Among the attempts that have been made to study the incidence of sickness in a population, those made by Edgar Sydenstricker in the town of Hagerstown, Maryland, are most noteworthy While these will remain for long a model of precision, their usefulness is limited by the narrow geographical boundaries of the study When the United States Public Health Service undertook to sponsor and superintend a morbidity survey using the organization and appropriations of the Works Progress Administration, they must have realized that they could not approach the accuracy of Dr Sydenstricker's work, but that they would be able to obtain a much more adequate sample of the national population Every precaution was taken to make the results as reliable as could possibly be obtained with the investigators available The enumerators underwent a special course of training A vigorous publicity campaign prepared the householders to cooperate so successfully that 98 5 per cent of the families approached were willing to supply the desired information The medical profession was almost equally obliging Consent of their patients having been obtained, 535,000 inquiries were mailed to the doctors to confirm the diagnosis of sickness reported. 400,000 answers were received relating to 350,000 attended illnesses

Altogether, 740 000 urban families and 36,000 rural families are included in the study The results may be taken as a fair indication of the amount of sickness and medical care found in the economic conditions of 1934 and 1935, during most of which time the medical relief project of the FERA was in operation The rural population cannot be said to be adequately represented in this study Only three states —not including New York—undertook rural studies Undoubtedly, one reason for this, though it is not mentioned in the report, was the difficulty of obtaining travel expenses under a WPA project The native Spanish-speaking population of the Southwest which is predominantly rural and which enjoys probably less medical care than any other part of our population, is not represented.

The conclusions reported in the first two bulletins from Washington tend to err, therefore, on the side of understatement The accompanying table shows the frequency rate of disabling sickness by economic status and the percentage of these cases attended by a physician

Physicians' Care Received for Disabling Illness as Related to Annual Family Income—2,308,588 Persons in 81 Cities Canvassed in the National Health Survey, 1935-1936

Annual family income and relief status	*Frequency rate Annual cases per 1 000 persons*	*Percentage of cases attended by physician*
All incomes	172	74
Relief	234	70
Non relief		
under $1 000	174	72
$1 000 to $2,000	155	76
$2 000 to $3 000	150	80
$3,000 and over	149	83

This table seems to bear out the opinion expressed in a recent resolution by the trustees of the American Medical Association that "A varying number of people may at times be insufficiently supplied with needed medical service for the maintenance of health and the prevention of disease"

Since these figures for disabling illness relate to illnesses disabling for one week or longer, it will probably be agreed that adequate medical care would include medical care to each of the cases reported. The fact that in families of $3,000 and over income no less than seventeen per cent of cases of disabling illness are unattended by a physician seems to demonstrate that the problem of providing adequate medical care is not only an economic one, a conclusion with which readers of *American Medicine*[1] are already quite familiar

Of a total of six million persons in the country as a whole estimated to be disabled on the day of the canvass, one and one-half million were found to be suffering from acute respiratory diseases Two and one-half million were disabled by chronic diseases About one-half million persons were disabled by injuries due to accident. The acute infectious diseases accounted for a

quarter of a million illnesses, mostly those of children, while acute diseases in the alimentary system were responsible for about the same number

It is estimated that one and one-quarter billion days are lost annually in this country from work, at home or in industry, or from school, through illnesses which disable for one week or longer The economic loss represented by this figure ought surely to justify a greater expenditure, both on preventive medicine and on treatment directed toward a reduction in the period of disability

At the time of writing these notes the two last bulletins of the series, dealing with the distribution of specific illnesses, have not been published

Hospitalization of the Prematurely Born

I do not mean to imply that I have adequately described the information given in the three bulletins already published I have not, for example, quoted any of the statistics on the hospitalization of the sick of the various income groups Instead, let me refer to a survey on a very small scale in a single New York City of the facilities available for the care of the prematurely born in its three hospitals This survey was stimulated by the visit of Dr Julius Hess, and was made by the district health department with the cooperation of the hospital superintendents The same score sheet was used as was used in rating the Chicago hospitals [2] On this score sheet the three hospitals rated respectiely sixty-six, fifty seven, and fifty-six per cent. Each of them lost twenty points out of the possible one hundred because breast milk was not available. I wonder how many superintendents of hospitals up-state are aware that breast milk may be obtained from the Mother's Milk Bureau of the Children's Welfare Federation, 325 E 38 St., New York City The milk is pasteurized, frozen into wafers, and put into sterile containers Only one of the three hospitals enjoyed the services of a consulting pediatrician

A Service to Practicing Physicians

Dr C W Grove, Health Officer, Geneva, has prepared a complete set of syringes, needles, gauze, iodine, alcohol, alcohol lamp, adrenalin—in short, everything necessary for the home administration of serum This equipment is stored in a compact wooden box, painted white, plainly labeled, and the sterile equipment is accurately dated. Included in the box are the two publications of the Bureau of Pneumonia Control—"Clinical Aspects of Pneumococcus Pneumonia" and "Technic of Serum Administration"

This set is kept in the staff room of the Geneva General Hospital It is available to physicians at all times After use, the hospital takes care of reouthting and resterilization

Although most practitioners probably have all the necessary syringes, needles and sterile goods somewhere in their offices, they often are not assembled for this purpose, and very possibly one essential item for the compete set may be missing Even if everything is readily at hand, it may take valuable time to get it prepared and sterilized Another advantage is that it simplifies the taking of blood cultures

Another Pneumonia Kit

The Syracuse Visiting Nurse Association has assembled a pneumonia serum kit. The association offers, with the use of this kit, the services of a V N A nurse to aid the physician with the administration of serum and to give nursing care.

The inadequacy of the existing Federal Food and Drugs Act is strikingly demonstrated by the fact that seizures of the toxic Elixir Sulfanilamide (Massengill) could be made only on the charge that the word "elixir" implied an alcoholic solution, whereas this product was a diethyleneglycol solution Astonishing as it may seem, had the product been properly labeled a "solution," not an "elixir," no charge of violation of the law could have been brought against the company that had sold a product which, when used as directed, had caused many deaths, notes a late issue of the *New England Journal of Medicine*

This example should be shocking enough to arouse the medical profession to action on the pure food and drugs act now before Congress

Medical News

Chemung County

Dr. Frank H. Lahey of Boston, spoke on Jan. 5 before 140 members of the Chemung County Medical Society at their annual dinner meeting at the Mark Twain hotel in Elmira.

Dr Lahey is chief surgeon of the Lahey Clinic, past president of the American College of Surgeons and a member of the American Surgical Society, Southern Surgical Society, New England Surgical Society, American Urological Society and the American Gastro-enterological Society

His lecture, illustrated with slides, was on "Some of the Newer Clinical and Laboratory Developments in Thyroid Disease"

Dutchess County

At the annual meeting of the Dutchess County Medical Society held January 12, at Poughkeepsie, the following officers were elected

President — Scott Lord Smith Poughkeepsie
Vice-President — G S Tabor Millerton
Secretary Treasurer — H. P Carpenter, Poughkeepsie
Associate Secretary — L. W Stoller Red Hook

Censors

A. L. Peckham — E. F Powell
J J Toomey

Delegate
C K. Deyo

Alternate Delegate
S E. Appel

Counselor
Hon G V L. Spratt

Reported by
H P Carpenter, M D, *Secretary*

Seventy members and guests attended a dinner after the annual business session and enjoyed an interesting talk on "Anesthesia," by Dr E A Rovenstine, professor of anesthesia at New York university

Erie County

A campaign to educate Buffalonians to the importance of taking an annual physical examination will be launched in the near future by the Medical Society of the County of Erie, Dr Harry C Guess, newly-elected president of the society, announced at its meeting in Hotel Statler, on Jan 17

As a first step in the campaign, members of the society's newly-formed speakers' supply bureau will address Parent-Teacher associations and fraternal and religious groups The proposed examination, which Dr Guess suggested to be taken by every individual on his birthday, would be complete and standard for all

Dr Guess appointed the following committee to direct the campaign for annual physical examinations Dr Stephen A Graczyk, chairman, Dr George L Sheehan, Dr J Frederick Pamton, Dr John L Hoffman, Dr Howard Osgood and Dr Roy L Scott.

As a speakers' supply committee, Dr Guess named Dr Harvey Hoffman, chairman, Dr John W Kohl, Dr James Jordan, Dr Mary J Kazmierczak and Dr Edward Tracy

Speaking on "My Impressions of a Doctor," Harold J Adams, Buffalo attorney, treated his subject from the viewpoint of a lawyer towards medical experts He urged greater care in the preliminary examination and also on the witness stand

Greene County

At the regular January meeting of the Medical Society of the County of Greene held in Catskill on January 11, Dr D D Rutstein of the Bureau of Pneumonia Control of the State Department of Health delivered an address on the treatment of pneumonia and illustrated it with a sound moving picture

About fifty per cent of the physicians of the county were in attendance. After the address a general discussion followed and a very profitable evening was spent. A light lunch followed

Reported by W M Rapp, M D, *Secy*

Jefferson County

Dr. M Lee Smith, seventy-eight, who died on Jan 19, had practiced medicine over fifty years

Kings County

The Monthly Meeting of the Medical Society of Bay Ridge was held on January 11 at the Shore Road Academy The subject of the evening was "Breast Tumors" The paper was read by Dr Benjamin Milton Cassel The x-ray treatment in such cases was presented by Dr Alfred Loomis Bell The subject was then discussed by Drs Dexter Davis and John J Masterson About thirty-five members were present.

Monroe County

AUTOMOBILE DRIVERS ARRESTED for drunken driving in Monroe County are to be examined by physicians to find if they are intoxicated. The cost has caused some discussion, and the $10 day and $15 night fees that District Attorney O'Mara proposes to pay doctors for examining allegedly intoxicated motorists were defended as inadequate by Dr Leo F Simpson, president of the County Medical Society, who said

"As a physician, I think the proposed fees are entirely inadequate Were I a lawyer, I know I would think them extremely funny

"Mr O'Mara is attempting to add another element to cut down the dreadful menace of intoxicated drivers and the Medical Society has agreed to co-operate. If subsequent events should prove medical opinion can be made of no legal value, we have at least tried"

"The present situation is a disgrace and a sad commentary on our intelligence and forcefulness"

Nassau County

DR. JAMES F MICHEL, who had practiced medicine in Farmingdale for forty-two years, died at his home there at the age of seventy-three after a brief illness

Active in the business and civic affairs of the community, he was for twenty-five years president of the First National Bank. He was village health officer and school district physician for many years He was also for many years on the staff of the Reed General Hospital, Amityville.

New York County

ORGANIZED MEDICINE IN THIS country is now actively engaged in mobilizing State and county medical societies to determine medical service needs throughout the country and to use available facilities to meet those needs, Dr Morris Fishbein, editor of *The Journal of the American Medical Association,* declared at a meeting of the Medical Society of the County of New York at the Academy of Medicine on January 24

Dr Fishbein contended that the answer to the problem of medical care for the American people "is not a plan but scientific planning" He explained that under the leadership of many county and State societies "definite provisions" for medical service to the indigent, and to those partly able to pay already have been established in various parts of the country He declared that "hundreds of such plans" have been reported to the Bureau of Medical Economics of the association. He pointed out that seventeen counties in Pennsylvania already have such plans actively in effect and that in Iowa, Kansas, California, Michigan, and Missouri, "many counties" have plans which are functioning

Dr Clarence G Bandler, president of the County Medical Society, pledged the cooperation of organized medicine in the metropolitan area to all efforts of governmental agencies to provide medical care for those unable to pay for it.

Dr Bandler pointed out that the society is now actively cooperating with the Commissioner of Hospitals, Dr S S Goldwater, on a "group hospitalization and medical treatment plan" This plan would require small "protective payments" in return for hospitalization and the payment of physicians on a fee comparable to the scale of the Workmen's Compensation Commission, he explained

Dr Adolph G DeSanctis, retiring president of the society, asserted that if organized medicine has been criticized the criticism was based on misunderstanding He said the society "will be only too happy" to lead in an open and frank discussion of medical problems

DR. FREDERICK FULLER RUSSELL, a member of the board of managers of Memorial Hospital for the Treatment of Cancer and Allied Diseases and lecturer on preventive medicine and hygiene at the Harvard Medical School and Harvard School of Public Health, has been awarded the Buchanan Medal of the Royal Society, London.

The medal is given in recognition of Dr Russell's services toward public health Dr Russell, who is a Brigadier General in the Medical Officers Reserve Corps, was chief of the Board of Health Laboratories at Ancon, Canal Zone, from 1915 to 1917, and was in charge of the Division of Infectious Diseases and of the laboratory service of the Surgeon General's office during the World War

From 1920 to 1923 Dr Russell was director of the Public Health Laboratory Service of the International Health Board, and from 1923 to 1935 was general director of the International Health Board While an instructor in the Army Medical School from 1907 to 1913 he developed the typhoid vaccine which the army has used with great effectiveness since that time

A TESTIMONIAL DINNER was given to Dr C J Imperatori at the Hotel St. Moritz, on the evening of January 20

Dr Imperatori is Professor of Clinical Otolaryngology at the New York Post-

Graduate Hospital, and Medical School of Columbia University He is co-author of a well-known text book on diseases of the Nose and Throat.

At this dinner, organized by the members of his teaching staff, Dr Imperatori was presented with an oil painting of himself, as a token of appreciation for his many years of endeavor in behalf of his associates

UNDER THE JOINT SPONSORSHIP of The New York Academy of Medicine and the Medical Society of the County of New York, a series of afternoon lectures will be given in Hosack Hall of the Academy of Medicine on Thursdays at 4 30 P M commencing February 17 The subjects for the eight lectures planned for this series are as follows

Feb 17 "Prenatal Care and Differential Diagnosis of Pregnancy," Alfred C Beck, M D

Feb 24 "The Diagnosis and Treatment of the Medical Complications of Pregnancy," William W Herrick, M D

Mar 3 "The Diagnosis and Treatment of the Surgical Complications of Pregnancy," Samuel A. Cosgrove, M D

Mar 10 "The Conduct of Normal and Abnormal Labor Including Consideration of Analgesics," Edward A Schumann, M D

Mar 17 "The Hemorrhages of Pregnancy," Harvey B Matthews, M D

Mar 24 "Postpartum and Postabortion Sepsis," Benjamin P Watson, M D

Mar 31 "The Postpartum Period," George W Kosmak, M D

Apr 14 "The Newborn Infant," Samuel Z Levine, M D

Niagara County

DR. HERBERT H BAUCKUS, of Buffalo, addressed the Medical Society of the County of Niagara at Lockport on January 11, on "Common Skin Lesions, their Diagnosis and Treatment"

Oneida County

THE OFFICERS ELECTED at the annual meeting of the Medical Society of the County of Oneida on January 11 are

President	H N Squier Utica
Vice-President	P P Gregory Rome
Secretary	James I Farrell, Utica
Treasurer	H D MacFarland Utica

Reported by James I Farrell, M D, *Secretary*

SPEAKERS AT THE dinner meeting of the Utica Academy of Medicine in Hotel Utica, on January 20 were Dr Warriner Woodruff and Dr Dan Vickers Doctor Woodruff spoke on "Thoracic Surgery," with Dr Hyzer Jones and Dr W C Jenson as discussion leaders Doctor Vickers spoke on "Common Duct in an Early Typhoid Carrier," and discussion was opened by Dr J L Golly

Onondaga County

DR FOSTER KENNEDY neurologist, addressed the Onondaga Medical society at the first meeting of the year in the new Medical college on January 4 on "Epilepsy"

Dr Kennedy is a graduate of the University of Belfast Ireland During the war he served as medical officer in the British army, and returned to the United States to take up the work at Cornell as professor of neurology, in the College of Medicine and chief of the neurological service at Bellevue hospital

DR CHARLES E WEIDMAN, Marcellus physician who practiced in Onondaga county for fifty-one years, died at his home after a brief illness on January 17

Ontario County

DR. ROBERT M Ross, physician in charge at Brigham Hall, was elected president of the Canadaigua Medical Society on January 13 at the annual meeting, at which Dr Robert G Cook, of Gibson Street, was host Dr Margaret T Ross, of Brigham Hall, was named vice-president and Dr C Harvey Jewett was unanimously re-elected secretary and treasurer Dr J Wendell Howard, retiring president, gave the presidential address, his subject being "Tuberculosis"

Queens County

DR. ALBERT A EPSTEIN, attending physician at the Hospital for Joint Diseases and at Beth Israel Hospital, read a paper on "Nephrosis" at a meeting of the Medical Society of the County of Queens, on January 21, at the society building

THE ROCKAWAY MEDICAL SOCIETY gave a dinner dance to mark its fifteenth anniversary on January 22 at Henri's, Lynbrook

Rensselaer County

THE RENSSELAER COUNTY Medical Society met in Troy at the Health Center on January 10 and Dr Stephen H Curtis, retiring president, gave a talk on "The Future of Medicine" Dr David W Houston spoke on "Socialized Medicine to Present Date" Dr A J Hambrook led the discussion

Richmond County

DR ALBERT WASCHABERGER was the speaker at a meeting of the Richmond County Medical Society, at the Old Mill, Hylan Boulevard, Grasmere, on January 12

Dr Waschaberger spoke on the treatment and management of sinusitis A discussion followed

Rockland County

THIRTY-FIVE MEMBERS OF the Rockland County Medical Society engaged in a discussion of the economic problems of a general practitioner at a meeing in New City on January 17 with Dr Frederick A Schroeder, president in the chair It was decided to renew the standard scale of fees, $2 for office visits and $3 for house visits

Suffolk County

THE NEWLY ELECTED OFFICERS of the Suffolk County Medical Society are as follows

President	Earl M McCoy Central Islip
First Vice President	Willetts W Gardner, Patchogue
Second Vice President	Roger Dexter Northport
Secretary	Edwin P Kolb Holtsville
Treasurer	Grover A Silliman, Sayville

Reported by Edwin P Kolb, M D, *Secretary*

Sullivan County

THE OFFICERS OF THE Medical Society of the County of Sullivan for 1938 are

President	Harry Golembe, Liberty
Vice-President	Ralph S Breakey, Monticello
Secretary Treasurer	Deming S Payne, Liberty

Reported by Deming S Payne, M D., *Sec'y-Treas*

Westchester County

DR WALTER W MOTT, of the State Medical Society committee on Medical Economics, spoke before the New Rochelle Medical Society at Wykagyl Country Club, on January 11, on "Medical Economics"

AT ITS ANNUAL MEETING on January 12 Dr W Godfrey Childress was elected president of the Westchester Tuberculosis and Public Health Association, Inc.

Wyoming County

THE OFFICERS OF THE Wyoming County Medical Society for 1938 are

President	R. B Bean, Castile
Vice-President	G G Davis Arcade
Secretary Treasurer	O T Ghent, Warsaw
Delegate to State Convention	H S Martin
Alternate Delegate	Z G Truesdell

Reported by O T Ghent, M D, *Sec'y*

IMPORTANT CONFERENCE ON TUBERCULOSIS

The Joint Annual Meeting and Luncheon Conference, sponsored by the New York Tuberculosis and Health Association, and the Tuberculosis Sanitorium Conference of Metropolitan New York is to be held this year at the Hotel Pennsylvania, New York City, March 1

The morning session is to be under the auspices of the Tuberculosis Sanatorium Conference which embraces forty-five tuberculosis hospitals and sanatoria in this area With Dr Foster Murray presiding, four speakers at the 9 30 A M session will give their views on Problems in Home Visiting, Clinical Standards and Procedures including Mass Tuberculin Testing and X-raying, 1937 Tuberculosis Statistics for New York and the Metropolitan Area, and Social and Vocational Rehabilitation of the Tuberculosis

Officers of the Sanatorium Conference for this year will also be elected at this session

A focal point of interest is to be the luncheon of the New York Tuberculosis and Health Association at which Dr I Arthur Myers, President of the National Tuberculosis Association, will have the role of chief speaker

Accepting "The Challenge of Tuberculosis" as the theme of their 1938 campaign, the luncheon conference will be of unusual importance in view of the concentrated efforts now being made to establish a minimum of two hospital beds for each annual tuberculosis death in New York City Dr I Ogden Woodruff, President of the New York Tuberculosis and Health Association, will preside and other speakers will be the Commissioner of Health, Dr John L Rice, and Bailey B Burritt, General Director of the Association for Improving the Condition of the Poor The annual meeting of the Board of Directors of the New York Tuberculosis and Health Association will be held following the luncheon

Additional information and luncheon reservations ($1 35) may be obtained from Bernard S Coleman Secretary of the Tuberculosis Committee of the New York Tuberculosis and Health Association, 386 Fourth Avenue, New York City (Caledonia 5-2240)

Hospital News

State System of Cancer Hospitals Discussed

OPPOSITION TO A STATE SYSTEM of cancer hospitals was expressed by numerous members of the medical profession who attended a public hearing held in Buffalo by the legislative Cancer Survey Commission on Jan 13, according to reports in the Buffalo papers

Representatives from Western, Central and Southern New York were in attendance when the meeting was called to order by Assemblyman Frank A Gugino, Buffalo Republican and chairman of the commission The fact-finding group, which was set up through enactment of a bill sponsored by Mr Gugino, launched its campaign last fall

The body was created for the purpose of making a comprehensive study of the cancer problem and with a view to formulating a long-range program for more effective prevention and treatment of malignant diseases

Dr Walter S Goodale, superintendent of Buffalo City Hospital, was the first to express his opposition to any proposal that would have the state set up a system of cancer hospitals

"I protest against any more of them" he said "And, in so doing, my remarks are not to be construed to be derogatory toward the present clinic here in Buffalo"

A Hospital Subsidy Suggested

Dr Goodale then cited figures showing that of the 7,000 hospitals in the country, not more than 25 of them treat all diseases He advocated a state subsidy plan for hospitals for the treatment of cancer cases

"And what about this subsidy?" enquired Dr Edward S Godfrey, Jr, state commissioner of health and a member of the commission

'Well," smiled Dr Goodale in return, "if you can use your well-known talents, you ought to be able to wangle enough money out of the Legislature to provide them"

Dr William Dean of Rochester, who spoke for the Monroe County Medical Society, told the commission that all cancer cases were being adequately taken care of by the institutions in the Flower City

"I'm opposed also to any state system in regard to cancer," he said "Any subsidy should be utilized by existing hospitals"

Dr Dean added that it was his belief that cancer is not a communicable disease and expressed the opinion that at present there is 'only a small amount of radium in the hands of practicing Rochester physicians"

Hospital in Center of State Urged

Dr Burton T Simpson, director of the New York State Institute for the Study of Malignant Diseases, in High Street, advocated a state hospital located in the central part of the state for "indigent cancer patients"

"I'm against any plan of state medicine that interferes with the general practitioner," he said, "but I am in favor of a state hospital for those indigent cancer cases The treatment of cancer is a group proposition, a science in itself I'm willing to have the state subsidize general hospitals for cancer treatment, but I wouldn't be willing to have the money go to a general hospital that wouldn't be willing to provide a good cancer clinic."

Dr Simpson praised the tumor clinic at Buffalo City Hospital, as one of the best in the country"

'It's my recommendation that the state build a hospital in the central part of the state for the advanced indigent cases," he added, "Don't spread them around"

Health Commissioner Francis E Fronczak also spoke in favor of a state subsidized hospital that would be fully equipped with the proper facilities and amount of radium necessary

The physician himself, however,' continued Dr Fronczak, "is the key to the case. He should be able to recognize a cancer case"

Dr James L Gallagher, chairman of the legislative committee of the Erie County Medical Society, said his group believes in "subsidization of the patient." He added that he also opposes any state system of caring for the victims

Dr Simpson in response to a question put to him by a physician, said that about

one death of every ten in New York State was from cancer The figure is less than the average reported by Dr Fronczak for Buffalo in 1937

Dr Simpson also indicated to Dr Samuel Varco, Buffalo surgeon, who is an associate member of the commission, that it is his belief that general practitioners may as well resign themselves to the fact "that they cannot treat cancer cases because of a lack of facilities"

Dr Ewing's Views

Dr James Ewing, vice-chairman of the commission and president of the medical board of Memorial Hospital in New York City, observed that radium always will be essential in treating cancer cases

"I have great confidence in the practicing physician" Dr Ewing added "But 45 per cent of the cases fail to get the proper diagnosis before they are hopeless. This blame can be equally divided between the physician and the patient"

The well known authority on cancer then discussed the question of having local groups handle the situation, instead of by state control

"You're losing a great asset in the local groups if the government steps in," he said.

He said that if there is a state subsidy to hospitals, then such hospitals should be able to meet all requirements necessary to carry on the work

"Hospitals must have the experienced help necessary before getting a subsidy," he continued

The other regular and associate members of the commission are Assemblyman Harry R Marble of Holcomb, Dr Karl F Eschelman, Dr J Sutton Regan, Dr Morton L. Levin, Dr Arthur H. Estabrook and Dr R S Ferguson

How to Figure Hospital Costs

THE NEED FOR ACCURATE financial information in hospitals is evident from the ever-growing interest on the part of hospital administrators, but the computation of functional unit costs has been slow and seemingly neglected Primarily, the hospital exists for the care of the sick, and to further this purpose requires efficient financial control Financial operating statements serve a purpose, but they do not supply the all important factor—costs

The revenue from patients compared to the direct expenses does not produce operating results The revenue must be compared to cost Unless a cost procedure is adopted, it is impossible to compare the true cost of services a hospital is rendering to patients with the revenue paid by and for patients Unit costs of patient care are a real base for rate revision, for comparisons with income produced from each service, for an accurate control of expenditures in relation to the income each produces Costs bring to light possible economies, indicate where free work should be controlled and for what services additional resources must be obtained. The advantages to be gained by the study and use of costs are numerous

A new book, "Procedure for Hospital Costs," illustrates and explains how departmental and service costs can be found and the results obtained For the purpose of showing that any size or type of hospital can apply the procedure, a hospital using only a cash book and recording few statistics was used as a model Obviously, the method can be applied by any hospital

To produce departmental and service costs, two steps are used They are entitled (1) Preliminary and (2) Final apportionment The term "apportionment" as used means the allocation of the expense of each department or operating unit by the use of a related statistical base Preliminary apportionment is the distribution of indirect expense to departments Final apportionment is the distribution of departmental cost to patient services

The book shows how each statistical base was worked out and how these bases were used to determine the departmental costs When the departmental costs are established such costs are distributed to patient services

As an illustration of the results which can be obtained, there are numerous questions and answers These questions cover costs, and, in addition, statistics which play an important part in the financial operation of a hospital There are an unlimited number of costs which can be produced For instance—What is the cost of operating the Administrative Offices? What is the average cost of maintaining a nurse? What is the average cost per employee for house-

keeping? What is the cost of housekeeping in the ward? What is the cost of maintaining all other personnel? The cost of laundry per pound? The cost per day for nursing care? The cost of social service? The cost of bed, board and routine services? An outpatient visit? A private ambulatory visit, deliveries, x-ray films, laboratory examinations, ambulance trips, combined services per patient day, the method for arriving at the number of computed free ward days, the average number of meals served per ward patient, the average cost of a meal to patients, the average number of x-ray films per semi-private patient, the average number of special nurses per day for private patients, the average pounds of laundry used per bed in the ward, the cost of educating a student nurse

The book has been reviewed by the representative hospital associations, public and cost accountants, and the consensus of opinion is that the book, the first published on the subject, serves a needed and definite purpose for the hospital field.

The book is approved by the New York Conference on Hospital Accounting and is authorized and published by the United Hospital Fund of New York The price of the book is $1 00

Newsy Notes

THE DEDICATION OF THE NEW $300,000 dispensary of Greenpoint Hospital in Brooklyn, on January 20, says the New York *Times,* attained sociological significance in the address of Peter J McGuinness, Register of Kings County and acknowledged laird of Greenpoint politics He mounted the stand to express the gratitude of the community and selected the following words for his message

"Thanks be to God we had such a Mayor and a Commissioner of Hospitals to help us They will take care of our poor people from now out, irrespectless of what befalls They've done it honest and done it good"

The Mayor was introduced by Dr S S Goldwater, Commissioner of the Department of Hospitals The Mayor said

"After Pete's benediction I think we might adjourn the meeting He struck the keynote. Now I want to thank the medical profession for its generous cooperation in aiding our program for dispensaries, health stations and hospitals I like dealing with doctors, which is more than I can say for my own profession"

"We are giving way on our building program to outpatient departments," announced Dr Goldwater "I am not prepared to say the voluntary hospitals should develop their outpatient services unless they are ready to expand their public wards—which does not seem to be the case"

Speakers included Dr Thurston Welton, president of the medical board, Dr Charles H. Goodrich, president of the New York State Medical Society, and Dr Joseph Raphael, vice-president of the Kings County Medical Society

A SPECIAL COMMITTEE, comprised of superintendents of hospitals in Westchester, will make a study of ways and means of establishing one rate for hospitalization in wards in Westchester institutions

At the present time, various rates are charged in the hospitals, and it is felt by the association that it would be of benefit to all institutions if a uniform rate could be agreed upon

• •

RETURN TO PRACTICALLY A pre-depression salary and wage base brought a net loss of $3,739 92 for Geneva General Hospital last year This was reported to the annual meeting of the board of trustees The hospital actually increased its operating income last year but more than $5,000 added to salary and wages more than offset this, it was said

FLUSHING HOSPITAL AND Dispensary finished last year with a deficit of $6,005 56, it was reported at the meeting of the Board of Trustees in January

However, Dr Arthur L Janes, president, was encouraged by this showing, first because the deficit for the previous year was $15,028.29, second because the hospital's participation in the United Hospital Campaign in the last three months of the year precluded the solicitation of direct donations and, third, the hospital's share of the United Hospital Fund, which will be received this year, is expected to wipe out the deficit a number of times over

one death of every ten in New York State was from cancer The figure is less than the average reported by Dr Fronczak for Buffalo in 1937

Dr Simpson also indicated to Dr Samuel Varco, Buffalo surgeon, who is an associate member of the commission, that it is his belief that general practitioners may as well resign themselves to the fact "that they cannot treat cancer cases because of a lack of facilities"

Dr Ewing's Views

Dr James Ewing, vice-chairman of the commission and president of the medical board of Memorial Hospital in New York City, observed that radium always will be essential in treating cancer cases

"I have great confidence in the practicing physician" Dr Ewing added "But 45 per cent of the cases fail to get the proper diagnosis before they are hopeless. This blame can be equally divided between the physician and the patient."

The well known authority on cancer then discussed the question of having local groups handle the situation, instead of by state control

"You're losing a great asset in the local groups if the government steps in," he said.

He said that if there is a state subsidy to hospitals, then such hospitals should be able to meet all requirements necessary to carry on the work

"Hospitals must have the experienced help necessary before getting a subsidy," he continued.

The other regular and associate members of the commission are Assemblyman Harry R Marble of Holcomb, Dr Karl F Eschelman, Dr J Sutton Regan Dr Morton L Levin, Dr Arthur H Estabrook and Dr R. S Ferguson

How to Figure Hospital Costs

THE NEED FOR ACCURATE financial information in hospitals is evident from the ever-growing interest on the part of hospital administrators, but the computation of functional unit costs has been slow and seemingly neglected Primarily, the hospital exists for the care of the sick, and to further this purpose requires efficient financial control Financial operating statements serve a purpose, but they do not supply the all important factor—costs

The revenue from patients compared to the direct expenses does not produce operating results The revenue must be compared to cost Unless a cost procedure is adopted, it is impossible to compare the true cost of services a hospital is rendering to patients with the revenue paid by and for patients Unit costs of patient care are a real base for rate revision, for comparisons with income produced from each service, for an accurate control of expenditures in relation to the income each produces Costs bring to light possible economies, indicate where free work should be controlled and for what services additional resources must be obtained. The advantages to be gained by the study and use of costs are numerous

A new book, "Procedure for Hospital Costs," illustrates and explains how departmental and service costs can be found and the results obtained For the purpose of showing that any size or type of hospital can apply the procedure, a hospital using only a cash book and recording few statistics was used as a model. Obviously, the method can be applied by any hospital.

To produce departmental and service costs, two steps are used. They are entitled (1) Preliminary and (2) Final apportionment. The term "apportionment" as used means the allocation of the expense of each department or operating unit by the use of a related statistical base Preliminary apportionment is the distribution of indirect expense to departments Final apportionment is the distribution of departmental cost to patient services

The book shows how each statistical base was worked out and how these bases were used to determine the departmental costs. When the departmental costs are established such costs are distributed to patient services

As an illustration of the results which can be obtained, there are numerous questions and answers These questions cover costs, and, in addition, statistics which play an important part in the financial operation of a hospital There are an unlimited number of costs which can be produced For instance—What is the cost of operating the Administrative Offices? What is the average cost of maintaining a nurse? What is the average cost per employee for house-

in stressing the need for additional accommodations for patients

GROUND WAS BROKEN IN January for the construction of a new x-ray building for the Mercy Hospital in Watertown The building, which will cost approximately $20,000, will be a one-story structure with a basement and will be added to the northwest wing of the hospital so that it will be a continuation of the hospital building Eventually, hospital authorities said, three stories will be added to the new building and will be used for general and maternity patients The present hospital facilities are inadequate From time to time the hospital census has been so great that hospital officials have been unable to accommodate all patients desiring admittance

A NEW BUILDING AT THE Columbia-Presbyterian Medical Center to provide low-priced private hospital service for persons of moderate means is urged by Dr Willard C Rappleye, dean of the Columbia University School of Medicine, as one of five pressing needs of the Center

The purpose of such facilities, Dr Rappleye declared in his annual report would be to accommodate the Medical Center's younger physicians whose patients cannot afford higher-priced rooms He said there was a rapidly increasing demand from the staff for low-priced hospital rooms

"It is the unanimous conclusion of the staff," he declared, "that the situation regarding semi-private services can only be met satisfactorily by the erection of a separate building of not less than 200 beds"

At the Helm

THE FOLLOWING HOSPITAL OFFICIALS HAVE BEEN CHOSEN Donald G C Sinclair, 2d, to be president of the Caledonian Hospital in Brooklyn, reelected, Dr Joseph Tenopyr, to be president of the medical board, reelected, and Miss Nora E Young, to be superintendent, continued.

Herman A. Schatz, to be president of the trustees of Vassar Brothers Hospital in Poughkeepsie.

Dr John J Quinlan, to be president of the staff of Troy Hospital

Elisha Walker, to be chairman of the directors of the Beekman Street Hospital, New York City

John Appel, Jr, to be president of the governors of the White Plains Hospital

Dr F J Scott, to be president of the medical and surgical staff of the Cohoes Hospital

Dr William H Williams, to be president of St Luke's Hospital Staff in Utica

Dr W B Roemer, to be president of the board of managers of the Oneida County Hospital, reelected.

Dr Floyd Nellis, to be president of the General Hospital staff at Utica

Thomas Kerley to be president of the Benedict Memorial Hospital Association at Ballston Spa, reelected, Miss Marion Macomber, to be superintendent, continued

Mrs Daniel Heinhardsen to be president of the women's auxiliary of the Mount Vernon Hospital, reelected

Miss Gertrude S Norton, to be president of the women managers of the Samaritan Hospital at Troy, reelected

Mrs Hamlin Wheaton, to be president of the Thompson Memorial Hospital Guild at Canandaigua

Mrs Charlotte Hubbell, to be president of the Corning Hospital Alumni Association

Dr F D Barnes, to be president of the Grasslands Hospital Staff

Dr Louis J Berg, to be president of the medical staff of Tarrytown Hospital

Dr Henry J Vier, to be chief of the medical staff of St Agnes Hospital at White Plains

Walter B Niven, to be president of the board of the Geneva General Hospital, reelected

WILLIAM H WALKER, president of the board of trustees of Flushing Hospital and Dispensary for twenty-two years, and well known in the world of art and humor, died on Jan 18, after a lingering illness His age was sixty-seven

Mr Walker, a resident of Flushing for the past forty years, devoted twenty-eight years of loyal service to the Flushing Hospital When Mr Walker retired as president of the board of trustees, last March, he was elected honorary president

For more than twenty-five years, Mr Walker was closely associated with "Life" humorous publication, in making political and satirical cartoons

THREE MONTHS OF CONTROVERSY ended in Rochester on Dec 27 when the outgoing Democratic Council voted a 10-year renewal of the Municipal Hospital contract.

Disapproving an amendment proposed by the three Republican minority councilmen which aimed at a cancellation clause on one year's notice, the six Democrats approved the new contract without change

Under it, the present arrangement will continue whereby the Strong Memorial Hospital of the University of Rochester exercises full jurisdiction over the Municipal Hospital

•

OLD DRAPERIES THAT are worn in spots but still contain good material, says *The Modern Hospital*, may be given a new lease on life by cutting the usable parts into strips six or eight inches or wider The strips are then sewed together, using a narrow upholster's fringe at each seam or a contrasting piping The vertical lines make the drapes effective and permit introduction of a new color note

• • •

THE AMERICAN COLLEGE OF SURGEONS recently made a survey to determine what measure of protection was afforded the hospital patient through licensing by states, cities, and other governmental units It was found that only three states out of forty which answered the inquiry required licensing of all hospitals, twenty admitted they had no requirements for the licensing, establishing, or operating of hospitals, two required a license for maternity and mental institutions only, and nine required licenses only for hospitals doing maternity work. One state has a licensing law applying only to mental hospitals Several of the larger cities have established regulations, but in some instances these are not enforced. Even where licenses are required, all that is usually necessary is the payment of an annual fee and conformance with certain requirements covering fire and other safety precautions Therefore, the American College of Surgeons has formulated for presentation to state, city and other interested bodies recommendations for the licensing and regulating of hospitals

Recently the fourth revision of the Manual of Hospital Standardization was completed It is available to all hospitals for ready reference A copy may be secured by writing to the central office of the college, 40 E Erie St., Chicago, Ill This manual contains a comprehensive, detailed explanation of all of the requirements for an approved hospital

• • •

"REFRESHER" COURSES ON THE treatment of pneumonia were given in 14 hospitals in New York City in January Commissioner Rice also announced that a group of expert advisers on the serum therapy of pneumonia had been organized and that private physicians could call upon the Department of Health for the services of such advisers in the treatment of their patients The service is free, the advisers being paid by the Department of Health for each such call

Improvements

THE NEW $150,000 WING of St Agnes Hospital at White Plains was opened on January 12 The wing, which is completely fireproofed, includes private and semi-private rooms, a sun parlor on each of the four floors, a semi-private ward on the second floor, a clinic in the basement, a physician's meeting room on the first floor and several sterilizing rooms The sun parlors extend the entire width of the wing at the south end Although construction has not been entirely completed, according to Sister Perpetua, superintendent of the hospital, it is the plan to open one floor at a time until the wing is fully under operation

A PROPOSAL THAT THE City of Troy establish a municipal hospital for the care of the indigent was laid before the Rensselaer County Medical Society's first meeting of the year by Dr Stephen H Curtis, who suggested that Rensselaer County deed to the city the present County Welfare Home, which would be remodeled at a cost not to exceed $30,000 and staffed as a municipal hospital exclusively for the care of patients without funds

REPORTS OF THE DIRECTORS and the superintendent of Ilion Hospital at the annual meeting of the hospital association agreed

This duty is imposed without reference to the opportunity or ability of those upon whom it is charged to know that there is any occasion for them to yield the right of way to which they are ordinarily entitled under the state law In the absence from the ordinance of any provisions to assure knowledge to the public of a superior right of way on the part of permit-holding physicians, its recognition in all instances could not reasonably be expected, and its attempted exercise would often be confusing and perilous The question here is not whether the city could validly give physicians a general right of way on its streets under suitable regulations for the protection of the persons and interests affected, but whether an ordinance conferring the right without any qualifying and safeguarding provisions, and therefore directly tending to jeopardize the public safety which the statutory right of way rule was intended to promote, is a valid exertion of the police power delegated to the city by the state, and is within the purview of the "reasonable traffic regulations" which the legislature has authorized the city to prescribe and enforce.

In our judgment the ordinance, in so far as it relates to the exercise of a right of way by physicians under such conditions as the evidence in this case describes, clearly fails to meet the test of reasonableness, which in view of the statute on the subject and the accepted principle of adjudication in such cases, it is our duty to apply

Separation of Symphysis Pubis

A married woman twenty-nine years of age consulted a doctor who specialized in obstetrics and pediatrics with respect to her condition of pregnancy The physician determined that the patient was in the third month of pregnancy and made arrangements to care for her and to take charge of the delivery of her expected child Following this, the patient returned at monthly periods for prenatal observation and the patient's condition was satisfactory throughout. Finally, the physician received a call early in the morning from the patient's house that the patient was in labor and ordered her to enter the hospital where arrangements had been made for her delivery The doctor frequently kept in touch with the patient during the day and in the early evening concluded that the patient would not deliver normally so it was immediately determined that a consultant should be brought in who promptly responded. The patient was put under a general anesthetic and the consultant, an obstetrician and gynecologist, actually delivered the child with medium forceps The child upon delivery was not breathing and attempts to resuscitate the child were of no avail The patient remained in the hospital about two weeks During that period of time, the patient's recovery seemed to be satisfactory Following the patient's return to her home, the physician saw her twice during the following week but never thereafter On the last of said occasions, swelling in the left leg was noticed and although plaintiff was able to stand she was unable to walk She seemed to be normal pelvically The doctor was advised thereafter that some other physician had taken over the care of the patient.

It was later learned that the patient's condition was diagnosed as a separation of symphysis pubis and that a wiring operation was performed for the purpose of uniting the said separation

Subsequently, a malpractice action was brought against the physician charging negligence in allegedly failing to determine before delivery that a normal delivery would not be possible, in causing upon the delivery the separation of the symphysis pubis, and in failing after delivery to determine the said condition and to take prompt steps to remedy the same Prior to the trial of the case, a physical examination of the plaintiff showed that she was at the time suffering from no ill effects X-rays then taken showed that the wire which had been introduced during the reparative operation had broken and that the position of the symphysis pubis was approximately the same it had been a short time following delivery as revealed by x-rays taken at that time Upon the trial of the case, before a judge and jury, the plaintiff's principal claim was that the defendant had been negligent following the delivery in failing to detect the separation and to take steps to remedy it. The defendant denied having observed any symptoms to indicate the condition and asserted that the delay in diagnosis did not in any way injure the patient. In this contention, the defendant was supported by testimony The issues in the case were submitted to the jury by the court, and a verdict was rendered in favor of the defendant thereby exonerating the physicians of all charges of malpractice

---

The Yonkers Academy of Medicine held a stated meeting at the Hudson River Country Club on January 26 Dr Walter Clark, Assistant Director of American Social Hygiene Association, presented a paper on Standardization of Syphilis Treatment.

LORENZ J BROSNAN, ESQ
Counsel, Medical Society of the State of New York

Physicians' Automobiles—Right of Way

In a case decided a short time ago in a nearby State, the question under consideration was the extent to which a municipality could properly grant special privileges to automobiles operated by physicians *

The general law of the State which regulated the question of right of way in traffic provided in part "All vehicles shall have the right of way over other vehicles approaching at intersecting roads from the left" The said provision was drawn so as to be statewide in effect, but cities within the State were empowered by law to "prescribe and enforce reasonable traffic regulations—applicable to all vehicular traffic" An ordinance adopted by the governing body of the principal city of the State provided in part as follows "The officers and men of the fire department with their fire apparatus of all kinds, when going to, or on duty, at or returning from a fire, and all ambulances, and the officers and men and vehicles of the police department, and all physicians who have a police permit (as hereinafter provided), shall have the right of way in any street and through any procession, except over vehicles carrying the United States mail The police department is hereby empowered to issue, upon application therefor, a permit for such right of way to any duly registered physician which permit shall not be transferable"

A collision occurred in the daytime at an intersection in the city which had adopted the said ordinance It appeared that A, who was injured, was riding in a car which had been struck on the left side by a car driven by Dr B She brought an action against Dr B to recover damages for her personal injuries Upon the trial the testimony of the plaintiff clearly showed that the car in which she had been riding approached the intersection to the right of the other car The driver of A's car testified that she was certain she had the right of way and that the defendant would recognize that right and stop While the defendant's version of the accident controverted the testimony put into evidence by the plaintiff as to some of the facts, the decisive factor seems to have been that defendant was permitted to prove that he was a duly registered physician and held a right of way permit issued to him by the police department When the Court charged the jury, he granted defendant's request and informed them that as such physician defendant was entitled to the right of way The trial resulted in a verdict for the defendant, and an appeal was taken from the judgment by the plaintiff

The chief point urged by the appellant was that the ordinance was an invalid one not being a reasonable regulation of traffic Since under the instructions to the jury a verdict had been practically directed in favor of the physician, the appellant contended that if the ordinance was invalid the judgment of the trial court should be reversed

The Appellate Court determined that the ordinance was not a proper regulation of traffic. After first determining that the ordinance was proper so far as it governed fire apparatus, police cars, and ambulances, the Court said in its opinion

The uniforms of the firemen and policemen, and the structure of the fire apparatus, ambulances, and police cars, immediately disclose their identity to those by whom the right of way must be yielded But a physician or his car, when using the city streets, is not so easily distinguishable.

No provision is made by the ordinance for any sign by which the mission of car or the vocation of the occupant is to be revealed. It is said that the defendant had a blue cross on his car, but this was not required by the ordinance It escaped the notice of the plaintiff and the driver of the automobile in which she was injured, and it does not appear that, if they had observed the cross, they would have been aware of its significance. The sufficiency of such a sign is not a subject to our present inquiry

The question as to the validity of the ordinance is to be decided according to its terms, and they do not provide that the display of a cross on a physician's car shall be a condition of the exercise of the right of way allowed him, or that he shall have such a privilege only when using a car or other vehicle of a designated type It is not even stipulated that the right shall be available to him only for the purposes of his professional duties The fact that a right of way permit has been issued to a physician by the police department is the sole ground upon which the ordinance directs other users of the public highways to recognize and respect the unqualified priority for which it provides

* *Kidd v Chissel*, 126 Atl 82.

gent, "neither could we imagine a more effective method of preparing our case for the battle that is bound to recur with increasing force in the coming legislature"

The expense of all this is met by a special levy of $10 on each active member of the state society

In these sober words, in the *Wisconsin Medical Journal*, President Sargent declares the high purpose of Wisconsin's physicians The italics are his

As the drive to socialize the care of sick here in America takes shape it becomes increasingly apparent that Wisconsin is to be given the doubtful honor of being singled out as a likely place in which a first foothold might possibly be gained The choice was not ours We could not divert the beginnings of the movement. We have succeeded, however, in putting a temporary stop to its progress and now we find ourselves blessed with time for careful research and reflection. *The months to come must be spent in an earnest and sympathetic review of the entire subject of proposed social and economic change in medical practice Where the certain promise of good is found, there we must go Where the promise for good is chimerical and unproven, however, we are driven by humanity's sake to resist Whatever our position, we must be both open-minded and fully informed If judgment leads us to a program of cautious resistance, that resistance must rely for success upon the force of constructive thinking, if we are to stand in absolute denial we must depend upon the power of genuine facts To such a program, by action of your delegates assembled our organization now stands fully committed*

Look at this Picture—

In its rovings, the committee has found out something else, too The county medical societies have come in for a bit of scrutiny, and the good and not-so-good stand out in sharp contrast In some counties, remarks the President, the physicians have come to know one another in a spirit of friendly understanding, there the county medical society is a cohesive and influential body, there the public relations committee has gained the confidence and cooperation of the various agencies handling the broad problem of the care of the sick

In such counties the roving committee usually finds that nearly every child has been vaccinated against smallpox and immunized against diphtheria, that a program of tuberculosis detection has been inaugurated and is continuous in the high schools, that medical care of relief cases is on a high plane and under a system of free choice, and, what is more, adds Dr Sargent, it finds that this medical relief work is being reasonably and properly paid for, within such limitations as may be imposed by a difficult local tax situation

—and at That

Other counties have been found by the committee, however, where this combination of friendly professional cohesion and effective public guidance is sadly lacking In these counties the medical society is commonly found split in factionalism and its public relations committee merely a name Worse yet, the authorities have learned to work independently of the profession, and medical matters in city, town, and county are handled on a purely political basis In such a county public health work usually turns out to be woefully inefficient, the medical care of relief cases is not up to standard, and the disease prevention program is poorly developed

In one Wisconsin county, for instance, the (part time) health officer in a large city is responsible for the entire medical care of over 3,000 persons on relief In that same county, we are told, 6,500 of the 8,000 rural children have never been vaccinated, their mothers have not been educated to its importance Yet in that very community, exclaims Dr Sargent there is an army of able and interested women who have been organized for years, seeking just such worthy projects to which to bend their effort and influence!

The Counties Make the Nation

Our entire nation, from sea to sea, is nothing more than the aggregate of its counties, and the sum total of organized medicine in America might be said to be the sum total of the county medical societies The question of sickness care in the nation distils down to the county It is in the county, the city, the village, that the problems rise of most immediate and vital importance to physician and patient, and the body to meet and handle these problems is the county medical society Where the county society is harmonious and filled with life and energy, there the care of the sick and preventive measures for the well are at the optimum Otherwise—otherwise Wisconsin's "roving" committee has discovered something

Across the Desk

Doctors Putting the "Wis" in Wisconsin

"Wis" was the old Anglo-Saxon word meaning wise, and was the root of our word wisdom, uniting with the ending "dom," which signifies state or condition So "wisdom" means a wise state, and that is what Wisconsin, or Wis for short, will be when the doctors are through with it Anyway, it will be wiser than it was before And the Wisconsin doctors are doing a fine job, not only for their own state, but for every other state as well

For Wisconsin, it seems, was picked by the backers of socialized medicine as a fertile field, and a group of measures, called the Biemiller bills, were introduced into the state legislature last year, designed to saddle state medicine upon the people and the medical profession there The state medical society put up a stiff fight, however, led by George Crownhart, its executive secretary, and the bills went down to defeat, as related at the time in this department

But the fear was felt, in Wisconsin and other near-by states, that the attempt would be renewed this winter, and that if Wisconsin fell, other states would be attacked In a way, then, Wisconsin doctors are holding the pass, to protect all of us Wisconsin is famous as a "progressive" state, open to liberal ideas, and perhaps was selected by the socializers for that reason If they cannot win Wisconsin, what hope can they have of winning more conservative states, or the nation as a whole?

The "Roving Committee"

The bad luck of anybody who tries to put something over on the medical profession is that he is up against a group of scientific thinkers The scientific mind goes at once to the heart of a question, and finds what is true and what is false in it. The best course of action is then as clear as daylight, and no smoke-screen of political eloquence can becloud or befog matters

In this case, the main question is whether the people of Wisconsin are getting adequate medical care Very well, why not find out? So the state medical society has appointed a special "roving committee" of physicians with the experience and background to fit them for the task, and this committee has been holding hearings at various key centers throughout the state, to receive and consider the complaints, opinions, and recommendations of all who can speak with any knowledge on the subject of sickness care.

No one seems to be left out who can tell the committee anything helpful President James C Sargent, of the state medical society, sat in with the committee at several hearings, and tells us that reports on sickness care were given by "such well informed sources as the county judge, the local relief administrator, heads of local welfare and social agencies, the county and city nurses, the mayor, the health officer, the superintendent of schools and the high-school principal, representatives of women's clubs and of parent-teachers associations, representatives of labor and of the local press, etc., etc." Then in the evening, after each day's hearing, there is a dinner meeting, where the officers of neighboring county medical societies report on conditions in their localities and aid the committee with advice and information

President Sargent feels it likely that the "roving committee", after its wide and deep research, can "with authority say whether or not the sick of our state actually are receiving adequate care." If inadequacies exist, "they will be uncovered and drawn sharply to the attention of our society," but "on the contrary, if this committee determines that sickness care in Wisconsin is adequate, readily available, and of high standard, it will silence once and for all the carping criticism heard now so frequently and with such seeming authority"

"Roving" Secretary to Scrutinize Europe

Of no less importance is the question whether any of the foreign systems of state medicine would be beneficial here The logical thing to do is to examine them, so the state medical society has dispatched Executive Secretary Crownhart to Europe for that purpose "Certainly there is none among us better prepared to undertake so important a study," declares President Sar-

Public Health Program", Salzmann has articulated these two chapters with the rest of the work.

The other three parts deal with "The Evolution of Preventive Dentistry", "The Organization of Dentistry in Public Health" and "The Role of Official and Unofficial Public Health Agencies in Dentistry"

As community public health programs are usually in the hands of physicians, this book should be of special value to such administrators A study of this work will enable these officials to understand better the public dental health problems, and to become acquainted with policies, procedures and standards that have already proven themselves successful in other communities

MICHAEL PEYSER

The Diet Book for Doctor, Patient and Housewife By Marguerite R Rea Third edition Duodecimo of 255 pages New York, Oxford University Press, 1937 Cloth, $2 25

Rea's diet book is divided into two sections The first deals, chapter by chapter, with the dietaries for the more common gastro-intestinal and metabolic diseases The second part has a scanty few tables and many recipes The first section appears to be written by a completely lay person (Mrs Rea's qualifications are nowhere stated) There is, for instance, practically no recognition of the quantitative elements in diet, even in the chapter on diabetes For this disease, a list of "allowed" and "forbidden" foods is given Among the foods allowed are bran bread and cakes and sour apples, among those forbidden are potatoes, brown bread, ripe apples, pears, peaches, melons, oranges, etc As this shows, there are many errors in the qualitative aspects of diet. Raw beef sausage appears in the gastric ulcer diet. No scientific explanation is given as to the basis of any of the dietaries For instance Mrs Rea lists the foods allowed and forbidden for hypertension without explanation as to the aim of the diet or what type it is

The foods suggested are very fancy expensive, and unobtainable from the point of view of cost and supply The following foods appear frequently on the suggested lists boiled pheasant, baked sweetbreads, boiled pigeon, roast partridge, grouse pomegranates, tamarinds, boiled calves' thymus, caviar, etc, all foods costly and hard to obtain in the United States The recipes in the second section should prove of interest to a chef or anyone with an unlimited pocketbook and interest in elaborate dishes

This book is of practically no value to either the doctor, patient, or housewife in America—except as an amusing document. So much recent work on diet has appeared which is accurate, scientific, and practical that this diet book can be ignored

ETHEL PLOTZ

Rose and Carless Manual of Surgery Edited by William T Coughlin, M D Fifteenth edition Octavo of 1536 pages, illustrated Baltimore, William Wood & Company, 1937 Cloth, $9 00

This textbook, intended for students and general practitioners, has been fully revised, and much of it rewritten to meet particularly American needs The subject matter is presented in a clear, concise, easily readable and readily assimilable manner It is intended to furnish the basic groundwork of the science and art of surgery The specialties are treated only in so far as they fall within the province of the general surgeon New chapters have been inserted, and new results, many in the form of colored plates, have been added These enhance the value of the text Though the subjects are treated in concise manner, nevertheless, they are sufficiently comprehensive for the student and the general practitioner, and the text is highly recommended to them

EMIL GOETSCH

A Textbook of Medicine By American Authors Edited by Russell L Cecil, M D Fourth edition Octavo of 1416 pages Philadelphia, W B Saunders Co, 1937 Cloth, $9 00

The new (4th) edition of Cecil's Medicine deserves more than the usual attention because of its use as a textbook in so many of our best schools As the teacher in the lecture room and at the bedside influences the thought and concept of the student, so does the textbook, the student's constant companion, exert its influence in a like manner

A number of features merit notice There is the weight of the book, approximately five and a half pounds, verily a weighty volume It, however, cannot claim supremacy in this respect, for another textbook of medicine heads the list with a seven pound volume And this is only one of a number of books the student must have about him and carry here and there For this purpose he indeed must have a "sound mind in a sound body" The pages in this volume number 1614 All this is mentioned somewhat prominently because this tendency cannot go on As it is, it has reduced itself to an absurdity What is to prevent a textbook of medicine from being published in two volumes? As far as subject matter is concerned, the division would be very

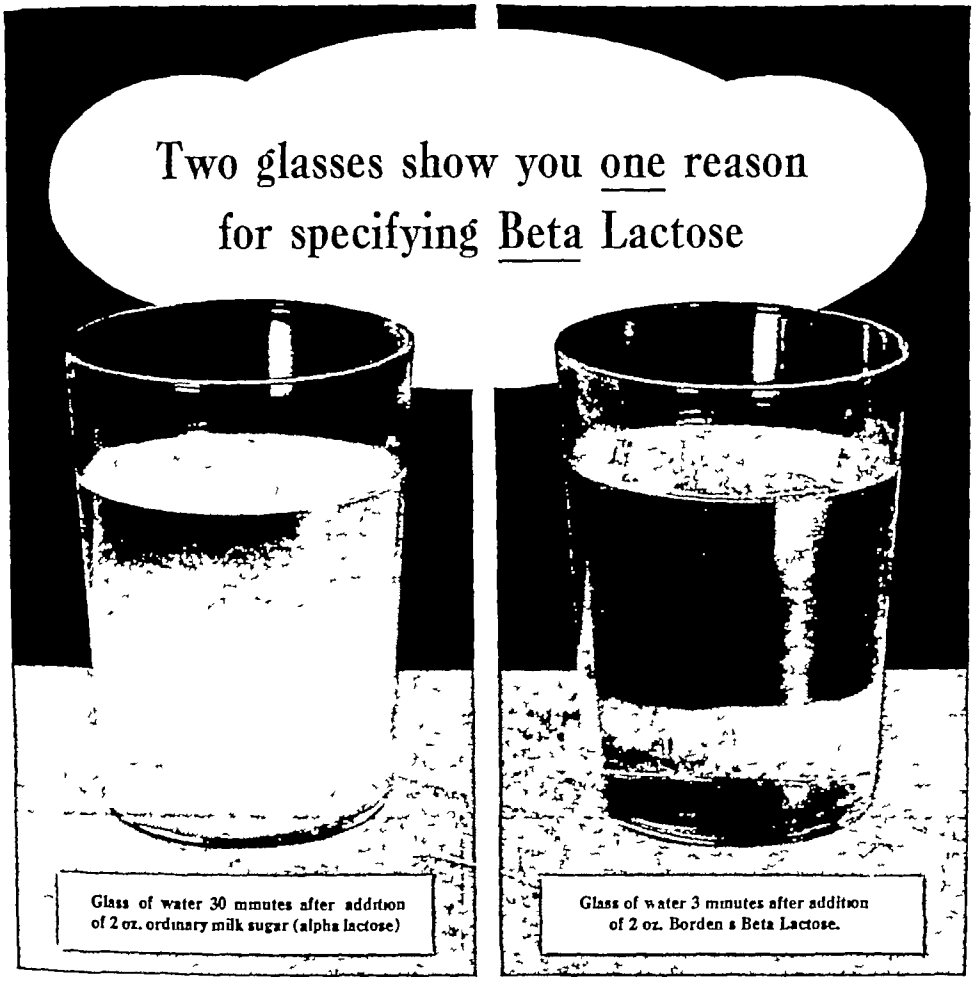
REVIEWED

Principles and Practice of Public Health Dentistry By J A Salzmann, D D S Octavo of 584 pages, illustrated Boston The Stratford Company, 1937 Cloth, $4 00



This work is of great interest because it deals with a subject, the importance of which is increasingly being recognized by public health officials It is the first book of its kind As is usual in a pioneering effort, the author omits discussion, or unduly limits it on some phases which in the opinions of others should merit fuller treatment. On the whole, the writer has done a good job, and in spite of its minor faults the work can be accepted as useful and authoritative

The two special contributors, who wrote the chapters on *Standards and Procedures in Clinics for Children,* and *Community Service for Children,* are generally recognized as experts in their respective fields In part four, which is titled "The Dental

ORDERING BOOKS

As a service exclusive to our readers books published in this country may be ordered through the Business and Editorial Offices of the Journal (33 W 42nd St. N Y C) postage prepaid Order must be accompanied by remittance covering published price.

Two glasses show you one reason for specifying Beta Lactose

● One excellent reason for specifying Borden's Beta Lactose is its greater solubility

Actually, it is *five times* more soluble than ordinary milk sugar So, it is decidedly easier to use.

And Borden's Beta Lactose also is much more palatable. So, it is much easier for your patient to take.

New, Improved Container—Borden's Beta Lactose now comes in a new, conveniently shaped container that permits easier measuring, easy access right down to the last grain

No directions appear on, or in, the container This product has been accepted, of course, by the Council on Pharmacy and Chemistry

Borden's

City_____ State_____

simple The additional expense surely is no deterrent The life of a two volume work far exceeds that of one cumbersome volume

We approach another feature of the book that is unusual, the number of contributors The preface states there are 130, but the actual count under the list of "Contributors" is 140 Is such a large number desirable? It is admitted that "The rapid growth of medical science during the last few years has made it almost impossible for a single individual to master the entire field" And yet it wasn't so very long ago that such a custom prevailed Is it now necessary to call upon 140 to perform the task? Couldn't a grouping be effected that would make it unnecessary to have more than one or two dozen contributors and not almost twelve dozen?

There is another and more serious fault resulting from "specialists" as contributors to a textbook, and that is the natural tendency to treat a subject in too detailed a manner For instance The discussion of Bacteriology of Rheumatic Fever is far beyond the needs of the student, and far beyond that met in many other text books in which the subject is not contributed by a specialist Another illustration It takes six pages to present Silicosis to the student. In a popular English text is a brief one paragraph account, and in a largely used American book, two paragraphs suffice And finally Rheumatoid and hypertrophic osteoarthritis consume twenty-two pages of description, including its subheadings of twelve different methods of treatment with a detailed description of each And to typhoid fever, in the same volume, are devoted twelve pages!

There is no intention to imply in the least that the material is not authoritative But much of it, indeed very much of it, is far beyond the needs of junior and senior students in a medical school For the student, it should serve as a reference book and not as a text.

There are some subjects treated in detail every line of which is of importance and of interest Special mention is made of acute lobar pneumonia and though twenty-two pages are devoted to it, no student or practitioner can afford to miss any part of it. The same might be said of Diabetes mellitus

The up-to-dateness of the material is shown by the appearance of a normal four lead electrocardiogram and a reference to it in the chapter on Coronary Thrombosis

Notice is taken of the statement that "Typhoid Mary" a chronic typhoid carrier, "was the source of infection in at least twenty-eight individuals" As a matter of fact the health department records have recorded fifty-seven cases as directly traceable to her with three deaths, but in the opinion of the reviewer, from his personal contact with her and a knowledge of her wanderings, she is suspected as the cause of many more.

Attention is directed to the meager description of acute (infectious) mononucleosis, this is a fault of most text books The student is not sufficiently impressed, and numerous errors result in recognizing a condition whose diagnosis is quite simple.

Exception is taken to the statement appearing in a discussion of the treatment of coronary thrombosis that "enemas should be used to keep the bowels open" Students are warned against this procedure.

Lederer's anemia is casually referred to as one of a group of hemolytic anemias, without any discussion of its symptomatology or its specific curative treatment. An English textbook devotes a separate brief chapter to it

Nothing in this review is intended as a reflection on the intrinsic merit of the work as a whole, but it is contended that for the student it should serve as a ready reference book, for the practitioner who is desirous of being up to date it is indispensable

SIMON R. BLATTEIS

Treatment by Diet By Clifford J Barborka M D Third edition, revised Octavo of 642 pages, illustrated Philadelphia, J B Lippincott Company, 1937 Cloth, $5 00

The third edition of Barborka's work on diet shows comparatively few changes from the second edition, and the general plan is the same It is a useful volume on clinical dietetics for the busy practitioner who wants little discussion of theory but needs practical diet lists for his patients It serves this purpose well, but lacking thorough tables, it cannot be recommended as a textbook in dietetics

There appears to be some disproportion in emphasis, gout, for example, being given twenty pages in contrast to nine pages for the far more common problem of undernutrition The chapter on pernicious anemia is weak in that it omits diets to be used in connection with the parenteral administration of liver, when it may be impossible or unnecessary for the patient to take liver by mouth The chapters on nephritis and the application of diet therapy are excellent.

The most serious drawback of the book is that the diets are not, in general applicable to low income groups Another edition should devote considerable space to low cost diets

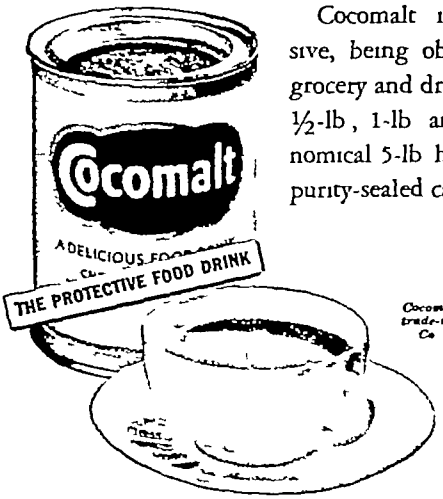
Supplies "DAILY OPTIMUM" OF "ASSIMILABLE" IRON



Leading authorities agree that 15 milligrams of *assimilable* Iron meet the daily needs of the normal patient Thus, since each ounce-serving of Cocomalt is fortified with 5 milligrams of effective Iron that has been biologically tested for assimilation (see chart for laboratory confirmation), three glasses of Cocomalt and milk supply the daily optimum"

• All animals were given weighed quantities of anemia producing diet Hemoglobin determinations (using Dare and Newcomer methods) made on 1st 16th, 37th, 45th and 51st days On 51st day hemoglobin of each animal showed less than one half of normal Supplementary feeding of 2 84 grams of Cocomalt started Hemoglobin determinations made on 7th and 14th day of this period Those on 14th day showed hemoglobin content of blood of all animals had returned to normal

A *protective food drink,* Cocomalt is scientifically prepared In addition to Iron, it contains 134 U S P Units of Vitamin D, derived from natural oils and biologically tested for potency The Vitamin D helps in the utilization of 15 gram of Calcium and 16 gram of Phosphorus also present in each ounce-serving of Cocomalt

Providing, as it does, *all* these essential food-minerals in *usable* form, Cocomalt is of definite prescription help to the physician Hot or cold, its delightful, creamy flavor appeals to most patients, old and young, alike

Cocomalt is inexpensive, being obtainable at grocery and drug stores in ½-lb , 1-lb and the economical 5-lb hospital-size purity-sealed cans

Cocomalt is the registered trade-mark of R.B. Davis Co Hoboken N J

Hospitals and Sanitariums

INSTITUTIONS SPECIALIZING IN TREATMENTS

An Inhalatorium

The recent establishing of a sanitarium in Lakewood, N J, where inhalation and pneumatic treatment facilities are provided, makes it possible for patients to receive the same form of therapy in respiratory disorders as has been practiced in many European spas for more than a hundred years It is obvious that the opportunity now available will permit physicians to refer many of their patients to the institution for inhalation treatments who would otherwise be unable to obtain such care. Physicians interested in this form of therapy, are invited by the Lakewood Inhalatorium, to visit and inspect the facilities of the institution when in the vicinity, and to write for a treatise on the subject

3 OUT OF 4
SMOKERS' COUGHS
CLEARED COMPLETELY

Patients with smokers' coughs were instructed to change to Philip Morris cigarettes

In 3 out of every 4 cases, the coughs disappeared completely

When these patients changed back to cigarettes made by the ordinary method of manufacture, within a limited number of days, coughs had returned in one-third of the cases

This Philip Morris superiority* is due to a distinct difference in manufacture Philip Morris employs diethylene glycol as the hygroscopic agent—proved a major advancement in cigarettes

NOTES FROM ADVERTISERS

A Representative Service

Miss Mary Jane Moore, offering a service in Real Estate help, provides what she believes is the first of a more personalized service to the medical profession

Knowledge of the profession's requirements from actual working experience within the field, she feels, gives her the insight to act as the personal emissary for the physician in locating suitable quarters and to assist in acquiring or disposing of an established practice.

Miss Moore feels that her success in this work merits her receiving the responsibility of relieving the physician of much of the work of transacting his real estate business

A Guide to Select Schools

SCHOOLS OF REFINEMENT WITH HIGH RATING IN EDUCATIONAL AND CULTURAL ADVANTAGES

The School Problem is Vital

The school problem is vital to the parents because they are deeply concerned with the education and training of their boy or girl It is equally vital to the school authorities because it is their business and life work School authorities find that parents usually make the great mistake of keeping their boys and girls at home too long In the first place, just because they love them they tend to humor them, often against their best judgment Because they love them, they spoil them A school staff loves the boys and girls, too, but in a different and more helpful way, because they do not allow it to bias their better judgment. No amount of coaxing or teasing can make the staff concede to the pupils anything that would be injurious or not for their best interest The teachers also find that some of the boys and girls have been poorly taught The educational defects need to be ironed out and corrected, something which cannot, or usually is not, done in the public school

Again, the school staff aims to co-operate with the parents, just as the patient co-operates with the Doctor in the restoration of health When you send your boy and girl to a private school have a confidential talk with the teachers and tell them just what you have discovered in your boy or girl that needs encouraging or restraining If they have any traits that need especial care, it is not only to your interest, but it is your duty to tell the teachers of them in order that they may act intelligently for the pupil's good.

The critical period is not during school hours, but rather in the hours after school and at night when public high school teachers have no chance to guide and lead, to help with lessons Private school teachers work, eat, play, and live with the boys and girls the entire twenty-four hours of the day They do their best work in developing characters in the recreation and study hours outside the classroom, a service which the public high school teachers have no opportunity to perform.

Education means the symmetrical development of soul, mind, and body Neglect of any one of these makes an unfinished man The most dangerous men in society are educated men whose moral characters are deformed, either by nature, which is very rare, or by neglect of early training

Another aim is to give the mind power rather than attempt merely to store it with information. The power to know is more important than knowing Recitations are but daily affairs The ability to think is for a lifetime, and its influence upon others is for eternity

MEDICAL ASSISTANT

The School-Child's Breakfast

Many a child is scolded for dullness when he should be treated for undernourishment. In hundreds of homes a "continental" breakfast of a roll and coffee is the rule. *If, day after day* a child breaks the night's fast of twelve hours on this scant fare, small wonder that he is listless, nervous, or stupid at school A happy solution to the problem is Pablum, Mead s Cereal cooked and dried. Six times richer than fluid milk in calcium ten times higher than spinach in iron and abundant in vitamins B and G Pablum furnishes protective factors especially needed by the school-child The ease with which Pablum can be prepared enlists the mother s co-operation in serving a nutritious breakfast. This palatable cereal requires no further cooking and can be prepared simply by adding milk or water of any desired temperature Its nutritional value is attested in studies by Crimm *et al* who found that tuberculous children receiving supplements of Pablum showed greater weight gain greater increase in hemoglobin and higher serum-calcium values than a control group fed farina

Travel and Resorts

Bradenton, Florida, "The Friendly City"

Bradenton, lying midway down the West Coast of Florida, is known as "The Friendly City" Tourists are reluctant to leave when it comes time for them to return to their homes, for the right-hand of good fellowship is extended to all visitors Reached by the Atlantic Coast Line Railroad, the charm of this little city looms up from the Green Bridge which spans the mile-wide Manatee River, five miles east of its mouth at the Gulf of Mexico From here one sees the beautiful yacht basin and Memorial Pier, and a little further to the right, the Chamber of Commerce Building, the Auditorium and Tourist Club Bradenton is sometimes referred to as the gateway to the tropics, and tropical plants and fruits grow in great profusion It is truly a garden-spot and an ideal location for both rest and recreation The mild climate makes it possible to enjoy all out-of-door sports, both in Winter and Summer Every imaginable kind of salt-water fish may be caught in the Manatee River, a fisherman's paradise Further up-stream, where the salt-water does not flow, fresh-water fish can be caught in great numbers Many kinds of game may be found within a few miles of Bradenton

The Recreation Park at Bradenton provides roque courts, shuffleboard tennis, bowling on the green, and horseshoe pitching Indoor provisions are made for those who enjoy checkers, chess and cards The Bradenton Country Club offers an 18-hole golf course, one of the finest in the South, and good roads in all directions make motoring to other points of interest a joy The Women's Club and Country Club are scenes of many social activities, and in addition dancing is enjoyed in Recreation Park and the Municipal Pier Building several nights each week Of the churches, the several denominations are housed in beautiful buildings and every effort is made to make newcomers feel at home Educational facilities are of the finest Bradenton is the largest city in Manatee County, and is the county-seat

There are ample accommodations in all price ranges, for the many visitors who go to Bradenton each Winter The Bradenton Tourist

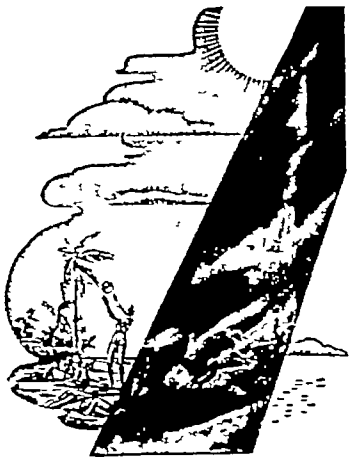
(Continued from page 45)

Club's membership is composed of people from every State in the Union, and offers much in the way of entertainment to those who join it. Good theatres offer the highest type of amusement, and boxing and wrestling matches are held weekly. Two airports furnish ample opportunity for airplane riding for those who desire it. Carnegie Library and Reading Room offers a wide selection of reading material, and is open to the public without a membership fee.

Fifteen miles to the west are located Bradenton and Anna Maria Beaches, on the Gulf of Mexico. The fishing village of Cortez, near Bradenton Beach, is of quaint interest to visitors. Historic Gamble Mansion, of Civil War fame, at nearby Ellenton, and Braden Castle at Manatee, are of great interest to sightseers.



In addition to other sports, sailing and aquaplaning on the Manatee River at Bradenton are popular. The Boston Bees National League Baseball Club does its Spring training at Bradenton.

Winter takes a Lido holiday

LIDO DECK—Conte di SAVOIA

69

The Thermometer Tells the Story! 69° is a fairly normal noon temperature on a typical Southern Route crossing though it may be freezing at home. Ask your Travel Agent for our illustrated weather map booklet giving comparative statistics.

WINTER goes a-summering on the Southern Route! Though the calendar wears a frosty look, it knows no power to change the bright skies, the blue waters, the friendly temperatures as your Italian liner approaches mid-ocean, skirts the Azores, pauses at Gibraltar and moves serenely on into the placid Mediterranean

"Lido" takes command! Thanks to the beneficent weather and thanks many times over to the design and construction of Lido ships your Winter crossing is transformed into a beach-revel of warmth and sunshine For this is the *open-air* way to all Europe, especially in the cold months Board the great Rex, the gyro stabilized Conte di Savoia or the charming Roma, for an express voyage Or treat yourself to the leisurely nine or ten port itinerary of the popular Vulcania or Saturnia if you can afford the time to *see more* on your way to Europe.

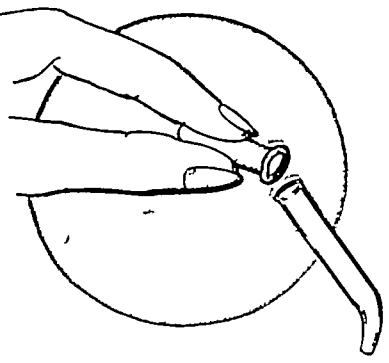
☆ OLEUM

is now supplied



new Vacap-Dropper*

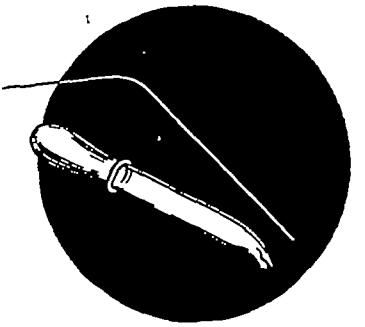
1. Economical

There is no loss of oil if the bottle is accidentally upset. As Mead's Vacap-Dropper need never be removed from the bottle, there is no danger of spilling valuable oil and soiling clothing or furnishings

2. No Deterioration

Made of high grade bakelite, Mead's Vacap-Dropper is impervious to oil. In warm weather, oil often rises up into the rubber bulb of ordinary medicine droppers, initiating a chemical action which eventually deteriorates both oil and rubber. With this unique device, there is no glass or bulb to become separated while in use.

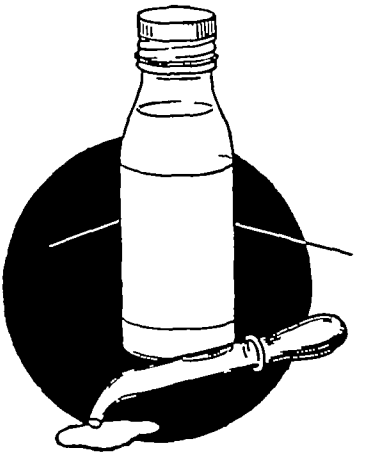
*Mead's Vacap-Dropper is supplied with the 50 cc. size of Oleum Percomorphum which patients find economical in use. The 10 cc. size continues to be supplied with the regulation dropper
* (U. S. Pat. Nos. 2105023 and 101575)



Ethically Marketed
as Advertised
to the Public

OLEUM PERCOMORPHUM is an economical source of vitamins A and D 100 times as potent as U.S.P. cod liver oil. For the prevention and treatment of rickets and tetany; to prevent poor dentition due to vitamin D deficiency; for pregnant and lactating women, for persons on restricted diets, to aid in building general resistance due to deficiency of vitamin A, and wherever cod liver oil is indicated

PERCOMORPHUM



n the 50 cc. size with the

. Unbreakable

ead's Vacap-Dropper will not break even when e bottle is tipped over or dropped. No glass the dropper to become rough or serrated.

. No "Messiness"

ead's Vacap-Dropper protects against dust and ncidity. The surface of the oil need never be posed to light and dust. Nor is there any ance for dropper to roll about and collect bac- ria or for oil on it to become rancid from epeated exposure to light and air.

5. Accurate

his new dropper, after the patient becomes ccustomed to it, delivers a uniform drop.

How to Use
